PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive forward step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922.

A monthly publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff are included. Mineral production reports formerly issued as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance are reported monthly. The assistance formerly given to producers and consumers by consultation or correspondence only, is also proffered through this medium.

While current activities of all descriptions will be reported in this Monthly Chapter, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added to that list in the future as they are completed.

The Monthly Chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

Beginning with the January issue the pages are numbered consecutively throughout the year, and an index to the complete reports will be included annually in the December number.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful latent resources of the State of California.

'Mining in California' is sent without charge to those on the Bureau's exchange list and to all others who make written or verbal request.

TO THE MINING PUBLIC.

Through ten years of service as State Mineralogist and executive head of the State Mining Bureau, I have endeavored to build up an institution that would be representative of the mining and oil industry of California, in order to create an organization of service to the industry and to the public at large which would aid in the development of the wonderful mineral resources of the State of California.

Work of this character can be accomplished only by the united effort and cooperation of those serving and the industry to be served. It is with some degree of satisfaction that I look back upon this period and note the marveling growth of the industry and the ability of this Bureau to grow and meet the ever-increasing demands made upon it. This growth has been made possible by the sympathetic cooperation and expression of the prospectors, engineers and owners of properties from all localities in the state, and it is my hope that in the years to come the Bureau's service to the public may increase many fold; I sincerely believe that it has a very important influence on the development of our latent resources.

There comes a time when it is impossible to continue public service without a sacrifice which is greater than personal interests can withstand, and it has become necessary to submit my resignation, which is given herewith.

SAN FRANCISCO, January 27, 1923.

HON. FRIEND WM. RICHARDSON,
Governor of California,
Sacramento, California.

DEAR SIR: I herewith submit my resignation as State Mineralogist of California, to be effective February fifteenth, nineteen hundred and twenty-three.

It is with a certain regret that I terminate my direction of the activities of the State Mining Bureau. I have realized for some time, however, that a continuance in public service was at a sacrifice to my personal interests.

During my administration of ten years, I have recorded the growth of California's mineral production from an annual value of ninety-three million dollars to the astonishing total of two hundred and sixty-eight million dollars, and have endeavored so to organize the State Mining Bureau that its service to the industry and the public would respond to this constantly growing production and the consequent demands because of it, in order that the greatest degree of aid to the development of our latent mineral resources might be attained.

Mining is the basic industry upon which our industrial, and even our agricultural, advancement depends. The proper development of our vast mineral resources, wise encouragement and their sane conservation are surely problems second to none in importance in the upbuilding of our great commonwealth.

We all know of the stupendous development of our oil resources in recent years, in the proper development and production of which the State Mining Bureau has taken no little part, but scant knowledge is had of the fact that a resource of close to two billions of dollars lies dormant in the unworked gravel deposits of California. A report is now well under way which, it is hoped, will focus the attention of the State upon the possibilities of winning this wealth and at the same time aid in the solution of our reclamation, irrigation, power and navigation problems, with which we are all so familiar.

The Great Mother Lode Gold Belt of California, which has produced millions and which will produce many more, is also the subject of another report, now in course of preparation.

California produces, in addition to these two vital resources, over fifty different commercial metal and mineral products, all of which are adding to the wealth and prosperity of the State.

It has been my good fortune to have met and known personally a great many men, connected with the mineral industry, and I am appreciative of the cooperation they have given in the work of the Bureau. A number of the employees have been in the

department for many years, and I take this opportunity of expressing my acknowledgment of their loyal service.

My paramount aim has been to build a tradition of service which would bring to California a recognition of her vast mineral treasure and I trust that the greatest possible support will always be given by the State to this great industry.

Assuring you of my continued interest in the work of the Bureau and the development of the mineral resources of California, I remain,

Respectfully yours,

FLETCHER HAMILTON,
State Mineralogist of California.

It is with regret that I submit this farewell to the State Mining Bureau, as through it I have formed many pleasant associations; and I send greetings to all in the mining industry, assuring you that I shall always have your best interests at heart.

FLETCHER HAMILTON.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each division working out from a local branch office.

This move brought the Bureau into close personal contact with operators, but did not materially shorten the time between the gathering of data in the field and their publication in the Report of the State Mineralogist at the end of an annual or biennial period.

Mining activities and development noted by district engineers in their respective fields are now embodied in monthly reports published in each issue of 'Mining in California,' thus making these data available within a maximum period of thirty days, and the Monthly Chapter as far as possible a compendium of current mining progress throughout the state.

The counties included in each field division and the location of the local offices are shown on the accompanying outline map of the state. (Frontispiece.)

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the state's oil fields is included under this heading.

REDDING FIELD DIVISION.

W. BURLING TUCKER, Mining Engineer.

REVIEW OF MINING DURING 1922.

The principal minerals mined in this district are copper, gold, iron, platinum, silver, zinc and pyrites. Asbestos, cadmium, chrome, clay, coal, diatomaceous earth, limestone, manganese, mineral water, quick-silver, volcanic ash, and pumice have all been produced to a lesser extent, but the industry is dependent mainly upon the first group, each mineral of which is considered separately.

ASBESTOS.

An increased demand for asbestos on the Pacific Coast has led to the discovery and development of promising deposits of this mineral in Shasta County near Sims, Siskiyou County near Edgewood, and in Trinity County in the vicinity of the Strode mine, near Carrville. In the above mentioned localities both amphibole and chrysotile have been developed and during the coming year some of these deposits may be established on a producing basis.

BARYTES.

During the year the barite deposit at Barium, near Copper City, Shasta County, was operated by H. C. Austin and a large tonnage of ore was shipped to Oakland and San Francisco.

CHROMITE.

Chromite is widely distributed throughout Del Norte, Shasta, and Siskiyou counties. There were no producers during the year, owing to

importations of foreign ore which can be landed at consuming centers cheaper.

COAL.

Deposits of coal occur in Humboldt, Shasta, Siskiyou, and Trinity counties, but the majority of these deposits are low grade lignites, usually occurring in rather thin beds. Coal is found in Humboldt County near Gerberville, near Hydesville, on Mad River, and on Maple Creek. In Shasta County beds of lignite coal are found on Cow Creek, in the Ingot district, also on Clover Creek. A vein of semi-bituminous coal is found on Beegum Creek. Deposits of coal occur in Siskiyou County at the headwaters of Kosh Creek, seven miles southeast of Glazier, on the Sisson and Fall River Mills road, also on Willow Creek, about four miles east of Henley. Coal is found in Trinity County in Hayfork Valley, Hyampom Valley, and near Poison Camp.

During the year only a small amount of development work has been attempted on the various deposits mentioned. The coal is used locally for blacksmithing.

COPPER.

There has been little change in the copper situation during the year and practically all the large copper properties with the exception of the Mountain Copper Company, and the Shasta Zinc and Copper Company, remained idle. The former shipped about 500 tons per day of pyrite ore, containing a small percentage of copper, to chemical plants near San Francisco. Their aerial tramway extending from the Hornet mine to Mathewson, a station on the Southern Pacific Railroad, was completed and placed in commission. It is $2\frac{1}{2}$ miles in length, has a capacity of 100 tons per hour, and replaces the Iron Mountain Railroad, used by the company for ore shipments for many years.

The Shasta Zinc and Copper Company completed their new refining plant early in June. The Rising Star mine was operated from June 1st until December 1st furnishing ore for the zinc-oxide plant, but on the latter date both mine and smelter were shut down. It is reported that the company plans to increase the capacity of the present plant, and resume operations early in the spring. The company produced about 12 to 15 tons of copper matte per day, as a by-product from their zinc-oxide plant.

At the Little Nellie mine, owned by the Pittsburg and Mount Shasta Mining Company of Pittsburg, Pennsylvania, a number of men have been employed on development work. The producing mines of Shasta County during previous years were:

The United States Smelting, Refining and Mining Company (Mammoth smelter, and Mammoth, Keystone and Sutro mines); First National Copper Company (Balaklala mines); Mountain Copper Company, Limited (Iron Mountain and Hornet mines); Pittsburg and Mount Shasta Mining Company (Little Nellie mine); and the Atascadero Mining Company (Greenhorn mine), all on the West copper belt. On the East copper belt they were: The Shasta Zinc and Copper Company (Bully Hill and Rising Star mines); and the Afterthought Mining Company (Afterthought, Donkey and Copper Hill mines), at Ingot. In Siskiyou County there was no activity in copper mining during the year, and the Blue Ledge and Grey Eagle, the two most important mines in the county, remained idle.

GOLD.

The high cost of labor and material during the year has curtailed and depressed gold mining. Many mines both large and small have remained closed down, and the few properties that resumed operations during the early part of the year were finally forced to suspend operations.

The substantial increase in wages in the copper, steel and other fundamental industries recently has resulted in a general increase in the wage level and the gold producer is now confronted by still further increase in production costs. In the present condition of the industry, this increased cost can not fail to result in further shutting down of mines, with a consequent wastage of ore reserves, and the rapid deterioration of plants and equipment. The federal government should no longer deny the gold mining industry a necessary adjustment to compensate for the present increased cost of production, but, as a matter of equity and wise public policy, should, without further delay make suitable provision therefor.

GOLD DREDGING.

The only class of gold mining in this district that has materially increased is hydraulic and dredging activity.

The only placers of any importance in Shasta County are those worked by the four dredges. The Shasta Dredging Company operates one boat on the middle fork of Cottonwood Creek, near Gas Point. The American Gold Dredging Company, near Redding, resumed operations the first of January, after a long shut down. The two dredges owned by Louis Gardella of Oroville, operating on Clear Creek, about seven miles southwest of Redding, worked the entire year.

There is renewed activity in dredging in Trinity County on the Trinity River from Lewiston north to Trinity Center.

The Lewiston Gold Dredging Company purchased the Valdor dredge and removed it from Junction City to the Martin ranch, seven miles north of Lewiston, on the Trinity River. The dredge has been rebuilt and heavier equipment installed. It started operations the first of January, 1923.

The Gardella dredge, owned by Louis Gardella of Oroville, was placed in operation on October 1922, on the Paulson ranch, $1\frac{1}{2}$ miles southwest of Lewiston. This dredge is operating upon a gravel bar at a bend in the Trinity River opposite Rush Creek.

The Trinity Gold Dredging Company's dredge located four miles north of Lewiston, operated continuously during the year. Estabrook Gold Dredging Company resumed operations on November 26th after a long shutdown. The dredge is located north of Trinity Center.

The Pacific Gold Dredging Company, who were operating a steel dredge near Carrville, suspended operations early in May, and the dredge is being dismantled, preparatory to shipping it to the Federated Malay States for use in tin dredging.

The Shasta Dredging Company is reported to have acquired the Van Matre ranch near Minersville and will install a dredge on this ground during 1923. There is a possibility that during the coming year, there will be five dredges operating on the Trinity River.

HYDRAULIC MINING.

Hydraulic mining was active in Siskiyou and Trinity counties during the early part of the year. In Siskiyou County hydraulic mining was active near Cecilville, Oak Bar, Forks of the Salmon River, Sawyer's Bar, Scott's Bar and Fort Jones. There promises to be renewed activity in this class of mining during 1923, as a large number of placer mines have installed new equipment to take advantage of winter rains.

The producing placers in the county were: The Black Bear hydraulic mine at Black Bear Creek; small placers at Callahan; Banner and Jefferson Consolidated hydraulic, and Shadows Creek hydraulic near Cecilville; Nugget Bar, Conszetti, Oak Bottom Placer Syndicate, and Victory hydraulic, at Forks of the Salmon and Etna Mills; small hydraulic and ground sluicing at Fort Jones; Sulphur Springs hydraulic on Empire Creek at Gottville; Jahdi hydraulic on the Klamath River at Humbug; Davis Consolidated hydraulic mines, Huey Hill hydraulic and smaller mines at Happy Camp and Hornbrook; Robinson hydraulic mine at Oak Bar; Burns, Casey, Gold Bank, Lanky Bob, Paddy Cronin and the Hickey Homestead hydraulic mines at Sawyer's Bar; Quartz Hill hydraulic mine at Scott's Bar; Portuguese Bar drift at Seiad Valley; Blue Nose and Lange Bros. hydraulic mines at Walker; Big Joe, Wetzel, and other hydraulic and sluicing mines in the vicinity of Yreka. The water season for hydraulic and other gravel mines in this county lasted generally from three to four months.

In Trinity County the active hydraulic mines were: Lorenz Bros. hydraulic mine at Weaverville; The American-Italian Hydraulic Mining Company on Paulson ranch near Lewiston; Snow Gulch hydraulic and smaller mines at Carrville; Underground Treasure (ground sluicing) at Coffee; McAtee Bar on New River; Little Klondike group of hydraulic mines on South Fork of Trinity River, near Forest Glen; a few small hydraulic mines at Hawkins Bar; Eagle and Rattlesnake hydraulic mines at Helena; Red Hill and Jacobs hydraulic mines near Junction City; La Grange hydraulic mine, between Weaverville and Junction City.

The Unity hydraulic mine, four miles north of Minersville, was purchased by the Nugget Bar Placers Company of Oakland and during the latter part of the year a new dam, ditch line, and flume were installed preparatory to starting hydraulic operations the first part of the coming year.

The Pittsburg-Comstock Company of Virginia City, Nevada, acquired the Dannenbrink hydraulic mine, situated on Canyon Creek between Junction City and Dedrick, and planned to start mining operations in January, 1923. The season's run for hydraulic mines in Trinity County is from three to four months.

QUARTZ MINING.

Some activity was shown in quartz mining in Lassen and Modoc counties during 1922. In Lassen County there was increased activity in the Hayden Hill district with the Buckskin and Juniper mines under operation.

In Modoc County development work was in progress on the Big Four and Sunshine mines in the High Grade mining district.

Shasta County.

The only gold mines operating continuously throughout the year were the Milkmaid, Franklin and Sybel mines.

The former ran its 10-stamp mill on dump material. The 5-stamp mill of the Shasta Hills Mining Company was operated continuously on ore from the Sybel mine. Other properties that were small producers or were being developed were: El Dorado, Double Header, Gladstone, Summit and Washington mines in the French Gulch mining district; Reid and Texas Consolidated at Old Diggins; Gold Leaf, Yankee John, Boswell near Redding; West End, Mad Mule and Ganim near Whiskeytown; Independence and Ruby Pearl mines west of Castella. Considerable gold was brought into Redding from different pocket mines located in the Shasta, Whiskeytown and French Gulch mining districts.

Siskiyou County.

There was increased activity in quartz mining in Siskiyou County during the year, and the outlook for this class of mining looks encouraging for the year 1923. The following mines were under active operation: Cub Bear and Homestake mines near Etna Mills; Highland mine near Callahan; Keynote, Hoboken, and Mount Vernon mines near Yreka; Lone Pine, Ida May, Ben Bull mines near Cecilville; Mountain Laurel and Gold Ball mines near Sawyer's Bar; Spring Flag and Eliza mines near Humbug; Gilta mine on No-Nothing Creek; June Bride mine on Trail Creek; Hoboken mine at Fort Jones.

Trinity County.

There was very little activity in quartz mining in Trinity County during 1922 and practically all the work was confined to development.

Properties under operation were:

Lost Horse mine on Scorpion Creek in Coffee district, near Carrville, and the Packer mine near Coffee. Lessees took out ore from the Brown Bear mine at Deadwood. The Strode mine, north of Carrville, was under active development during the year. Layman mine, near Hayfork, was under operation during early part of year, but suspended operations in June. Enterprise mine operated until July when work was suspended; the 10-stamp mill ran part of the time. The Bonanza mine was under development. It is situated in the East Fork mining district near Helena. Trinity Bonanza King mine, north of Trinity Center, was operated by the Foster Gold Mining Company. Gold Leaf mine between Trinity Center and Delta. The Five Pines mine, in the Minersville district two miles north of Minersville, was operated by lessees. Gifford and Venicia mines on Eastman Gulch five miles north-east of Lewiston, were under active development during the year.

INFUSORIAL AND DIATOMACEOUS EARTH.

The Mount Shasta Silica Company of Weed, Siskiyou County, has been incorporated to develop and mine a large deposit of diatomaceous earth. The deposit is located in the northeastern part of Shasta County, close to the line of the Pacific Gas and Electric Company's railroad from Bartle to Pit River.

The holdings of the company are known as the Insulator group, consisting of 39 claims, located in T. 37 N., R. 2 and 3 E., about 20 miles from Bartle. The company plans to start operations in 1923.

IRON ORE.

The Noble Electric Steel Company, Heroult, Shasta County, continued to supply high grade magnetite, carrying 65 to 70 per cent iron, to San Francisco Bay points and Los Angeles during 1922. The shipments have averaged about 10 cars per month, during the year.

LEAD.

The production of lead for 1922 will probably be very small. A few lots of silver-lead ore were shipped from the White Star and Climax mines, South Fork mining district, near Igo, Shasta County, to the Selby Smelting and Lead Company, during the year.

LIMESTONE.

The only production of limestone was from the quarry on the Shasta Iron Company's property, shipped by the Noble Electric Steel Company to the Shasta Zinc and Copper Company at Winthrop for use as flux in the smelting plant.

MANGANESE.

Manganese mining has been stagnant throughout the entire state during the past year. There was no production of manganese from the northern counties during the year.

MINERAL WATER.

The principal production of mineral water in this district comes from Siskiyou County.

PETROLEUM.

The Tuscan Oil Company resumed drilling operations on its property six miles north of Red Bluff. The well is down 1800 feet and is in sand and blue shale.

PLATINUM.

Dredges operating in Shasta and Trinity counties produced practically all the crude platinum reported in 1922. A large part of the Shasta and Trinity crude platinum is osmiridium, recovered by the dredges on Trinity River, and Beegum and Hayfork Creek placers. A large number of claims were located on Hayfork and Beegum Creeks during the year, but the production was small from these placers, probably not amounting to over 10 ounces.

PYRITE.

The Mountain Copper Company, Shasta County, was the only producer of pyrite ore during the year. The ore mined and shipped from the Hornet mine averaged 45% sulphur and .7% copper. The ore is sold to the General Chemical Company and the Standard Oil Company. The latter company returns the pyritic cinder to the Mountain Copper Company's Martinez plant where it is leached and the copper recovered.

QUICKSILVER.

There was no activity in quicksilver mining in Modoc and Siskiyou counties due to the low price of the metal.

SILVER.

The California Bi-Metallic Corporation of Santa Barbara, California, which was organized in August, 1922, took over the Chicago and Silver Falls mine in the South Fork mining district, near Igo, Shasta County. An air compressor and other machinery were installed and additional camp accommodations have been provided. An active development campaign is under way and some high grade ore has been developed. Sixteen men are employed.

Other active mines in the district are the Continental, White Star, and Climax. Shipments of ore were made from the White Star and Climax mines during the year to the Selby Smelting and Lead Company. The prospect for continued activity in the silver mines of this district is bright.

ZINC.

The Shasta Zinc and Copper Company at Winthrop, on the east copper belt, was the only company mining zinc ores in 1922. The ore was mined from the Rising Star mine of the Bully Hill group. The 150-ton reverberatory smelter and zinc-oxide plant was completed in June, 1922, and operated until December, 1922, when operations were suspended due to a fall in price of zinc-oxide.

At this plant the crude ore is crushed to 10-mesh, and the sulphur content is reduced by roasting to make it suitable for reverberatory smelting. The copper, gold and silver are recovered in the matte and this matte is shipped to the Tacoma smelter. The fumes from the reverberatory pass to the first bag house, where the zinc-oxide is recovered. This zinc-oxide, which contains soluble sulphates, is retreated in a refining furnace and then passes to a second bag house where the zinc-oxide is recovered as a marketable product.

It is planned to increase the capacity of the plant and a resumption of operations is contemplated about April, 1923.

The Afterthought Mining Company at Ingot, Shasta County, California, was idle during the year.

AUBURN FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

II. CONDITION OF MINING IN THE AUBURN DISTRICT, 1922.

(Continued from December Chapter.)

Amador County.

This county remains the principal quartz gold producer on the Mother Lode and in this class of mining is next in point of production to Nevada County, with the probability that in 1923 it will considerably surpass the latter. The total gold yield for 1922 was about \$2,000,000. There have been numerous interruptions during 1922 in the operation of the principal mines, among which have been the Argonaut fire and the cessation of milling at the Central Eureka during extensive improvements.

When last visited (January 6), the work of retimbering and clearing the shaft at the *Argonaut Mine* had not been finished and foreman Ben Sanguinetti estimated that 50 feet remained blocked. The section of the shaft from 3350 feet to 2500 feet was the scene of the fire. Many

small caves occurred in this distance, most of them extending about 8 feet back into the wall. The largest cave was 50 feet long, 10 feet wide and 8 feet deep. The shaft was found to be completely filled from the 3100 level to 3350 feet, with rails, pipe, burnt timbers and caved ground, according to Sanguinetti, and allowed only slow progress. It was also filled at intervals above that. After the shaft is cleared, the water, which at this time is 7 sets below the 4500 level, will have to be removed. If no other delays arise meanwhile it will be April or May before milling is resumed.

The Argonaut disaster occurred on August 27 and it would appear that the fire had been burning only a short time when discovered at about 11.30 o'clock that night. As the later developments proved, the fight for the lives of the men underground was lost during the first hour or two after the fire started, if indeed they ever had a chance. The deplorable event attracted the attention of mining men all over the country and many hurried and ill-advised statements were made and given wide circulation. There will probably always be a question in the minds of those best acquainted with the circumstances, as to whether or not any of the means suggested for saving the men could have been successful. There is room for doubt, based on past experience of engineers with somewhat similar fires, as to whether or not the men could have been brought safely through the fire zone in the skip. The matter of ventilation in the Argonaut has not been as well understood as is necessary for an intelligent discussion. Fresh air was drawn into the lower workings through the main shaft, and on account of the depth and extent of the workings the proper ventilation of these lower levels had already become a serious problem. Intermediate levels had to be shut off by doors, and the circulation of air depended on unimpeded entry at one shaft and exhaust through the other, after passing through the lower workings. It was probably only a short time after the start of the fire that caving began in the shaft. There are not enough data at hand to warrant the assertion that enough fresh air could have been forced to the bottom of the mine to keep the men alive, bearing in mind the obstructed condition of the main shaft, even had the Muldoon fan been stopped or reversed at once. It is quite likely that had this been done, it would have been found that as soon as caving began in the Argonaut shaft, the air would have begun to short circuit in the middle levels from the Muldoon shaft and its interconnected raises across the intervening ground to the Argonaut shaft, as for example at the 2400 level.

Disastrous underground fires in California metal mines have been of such rare occurrence that no one has realized the potential dangers from this source. Safety lies in preventive measures, rather than in elaborate fire fighting plans. Shaft timbering should be kept wet enough to prevent burning. Where two mines are working near together at considerable depth, the advantages of a connection in the deeper levels are too obvious to leave room for dispute. With properly protected electric wiring, there is really little danger of underground fire in the California gold mines. Where workings are dry and a great deal of timber is used, fire fighting apparatus should be at hand, as the chief value of such apparatus is in snuffing out small fires, before they get out of control.

Bunker Hill Mine has recently had another change of management, and those now in control have not yet (Jan. 7) decided on a plan for future operation. There was no important production during 1922. At present the mill is idle but the underground workings are being kept unwatered and repaired. Due to the fact that the present control is supposed to be in the hands of those owning the Original Amador Mine adjoining, the idea has gone out that it is planned to explore the latter through the Bunker Hill workings.

Central Eureka Mining Company's mill was idle most of the past summer during extensive improvements above and below ground, which were begun in 1921. The property is now equipped with a new steel headframe 85 feet high, new ore and waste-bins, 53-lb. T-rails in the shaft and electric hoisting equipment capable of working to a depth of 5500 feet. Milling was resumed the middle of August. At present, January 8, they are milling at the rate of about 150 tons a day or 4000 tons a month of ore averaging about \$9 a ton, according to Supt. Albion S. Howe. The deepest level is at 4100 feet incline, or 3800 feet vertical depth. The same company is still prospecting the South Eureka, but no important developments have been announced.

At the *Fremont Mine*, the development work during the year has given such encouraging results that the mill is being put in shape for operation, with the prospect of a long run in sight, in the opinion of Supt. B. I. Hoxie. The 1650 level from the Fremont shaft has been run north a total distance of 2500 feet. Hoxie reports that they have drifted 350 feet in ore on this level on the contact vein between the slate and the greenstone. He estimates an average width of eight feet of ore here, and with what was left in the mine when it closed, he thinks they now have enough for several years' milling. The 1950, 2350, 2550, and 2750 levels are being cleaned out. The Gover shaft, 1350 feet north of the Fremont shaft, is 1500 feet deep and will be made use of in the operations. Hoxie has installed a sprinkling system to prevent the possibility of a shaft fire.

The *Kennedy Mine* and mill have been in operation nearly all the year except for interruption at the time of the Argonaut fire. The mill is handling 200 to 270 tons of fair grade ore from the 3900 and 4050 levels. Legal skirmishing is still going on, preliminary to the suit filed by this company for \$500,000 damages against the Argonaut Mining Company and the cross suit of the latter against the Kennedy company for \$800,000.

The mill at the *Moore Mine* got into operation early in October. Difficulties and delays incident to initial operations, and trouble in getting out enough ore to keep the mill running, kept them from making much production the first two months. For about 23 days in December the mill of 20 stamps is reported to have crushed 2265 tons, yielding about \$6.35 a ton, with a rather high tailing loss. The low returns from the first operations, as contrasted with the reported high assays previously obtained, is attributed to poor judgment in stoping too great a width, as much as 32 feet in width having been mined and milled from the 500 level. Part of this is said to have been low-grade schist containing considerable low-grade sulphides. Alexander Ross, for many years foreman at the Kennedy Mine, has lately been put in charge of underground work, assuring proper attention for this important department of the venture.

The workings of this mine, as far as then opened, were described in the July chapter of MINING IN CALIFORNIA. Since then the 600 level (540 feet deep), has been opened and drifted 213 feet north and 50 feet south, with ore reported for about 100 feet in length on the north. A total crew of 65 men are employed, of whom 35 work underground, and 80 tons of ore are being milled daily. The grade of ore and concentrate is reported to be improving as more careful mining methods are being employed.

Plymouth Consolidated is the only mine in the county that has been continuously productive during 1922. A total of 92,500 tons of ore were crushed during the past calendar year, for a gross production of \$460,000, in round numbers, or \$5 a ton. Cost per ton and yield per ton have been very near together during 1922, and the tonnage of ore developed for each foot of development work has been low, as the ore has been occurring in rather small lenses. The work for the year was below the 3050 level. The shaft is 3400 feet deep, from which level a winze extends to 3890 feet. Preparations are being made (January 5) to open a new level at 3850 feet. Superintendent Stanley Arnot expresses satisfaction at the assays obtained and the general indications in sinking the last 140 feet of the winze, and the showing on the above date was very good. According to Arnot's figures, the total cost per ton averaged for the entire past year has been about 44 cents less than in 1921, but for December, 1922, there was another marked decrease. There has been, if anything, a decrease in labor efficiency. A total crew of 160 men are employed, of whom 110 are underground. The plants on this property for hoisting and milling have been models of advanced practice since this company reopened the mine. W. J. Loring is general manager.

The *Treasure Mine* was closed September 23. The mill had been operated intermittently during the first half of 1922 on very low-grade ore, but was closed in July. The present owners are said to have no plans for reopening. The lower levels were not profitably productive, although above 2300 feet the mine yielded enough profit to build up a small surplus. The operations had reached a depth of 3030 feet on the incline and the lowest level was at 2970 feet.

Off the Mother Lode in this county there was little actual production of gold noted in 1922 except at the Elephant hydraulic mine at Volcano, two or three smaller hydraulic mines and small scale quartz operations in the Defender district, which have not been visited on account of lack of time.

Calaveras County.

Carson Hill Gold Mines, Inc., has been the only producer on the Mother Lode within the county during the past year. This property now embraces Melones Mine Group, Morgan Mine Group, and Calaveras Group, of which the first two were under operation during 1922. Ore mined from the Morgan has been all from above the 1100 level; that from Melones Mine has come from the levels between 3600 and 4000 feet. The costs of certain mining items for Melones ore, which was raised through a winze, were about double those for Morgan ore. The combined properties produced during 1922 a total of 183,733 tons of ore of a gross value of \$1,035,000, in round numbers. Costs of operation have shown a downward tendency, but this is partly due to

increased duty of the milling plant. The thirty stamps of the mill are used for coarse crushing and amalgamation, followed by grinding in Hardinge mills and concentration. The concentrates, sands and slimes are all cyanided under contract. During the year past this mill made a splendid record, handling an average of 15,300 tons a month, giving the remarkable average daily duty of 18.44 tons per stamp with an average of 27.67 stamps in commission. The recovery from concentrates averaged 92% as per contract; from sands and slimes 67.69%, and average actual recovery from all products for 11 months of the year was 90.41%. Average cost per ton for operation and development during 11 months is reported by the company at less than \$4 a ton, but this figure, like many averages, is misleading and especially so in this case, because the costs for the two mines were so different. For ore from the Morgan Mine alone, the cost per ton on the basis of the above tonnage would be considerably less. For ore from Melones deeper levels the costs were higher on account of greater depth and the disadvantage of working through a winze. When the winze has been converted to a working shaft, costs of working this ore will be materially reduced, it is hoped. Meanwhile, the joint operation of the two properties is desirable due to the large available tonnages.

The same management has been prospecting several claims at Chaparral Hill, just north of Carson Hill. Surface trenching and underground work have been done on the Tullock, Hardy and Chaparral claims. This work is still being prosecuted with about 20 men.

Calaveras County is fortunate in having such an operator as William J. Loring. At a time when mining on the Mother Lode in the county had come to a standstill, and capital was diverted elsewhere or hidden in tax-free securities, he succeeded in raising money to reopen the *Morgan Mine* and developed in it fine bodies of good ore. This was done when the *Utica*, *Angels* and *Melones Mining Companies* had quit because of high costs, and the erroneous impression was going out that the Mother Lode in the county was exhausted. The Morgan ore bodies were found within a few feet of the *Melones* workings. Loring's later work in the deeper levels of the *Melones Mine* itself have revealed good ore, and the 4000 level in that mine is now being prepared for stoping. Loring has put in effect many advanced ideas in technical practice and in his relations with the public has exhibited a broad-minded and helpful spirit. In the four years beginning with 1919 the combined properties operated by *Carson Hill Gold Mines, Inc.* have produced \$4,161,166.

Among the East Belt mines of the county there has been considerable activity but only a few have been productive during 1922. *Sheep Ranch Mine* was a producer, with 20 stamps running during the first five months of the year. The mine and mill were closed down June 10. When last visited, late in 1921, this mine was producing about \$14 ore from small stopes between the 1300 and 1550 levels, and the 1700 level stope was being opened.

Bullion Hill Mining Co., six miles north of Murphy's, was a satisfactory producer during the year, with a 5-stamp mill.

In the West Point district, the mines of which were described in the January, 1922, issue, the year started with promise, as the *Lone Star* and *Keltz* properties were both being prospected by a well-financed company and it was hoped that one at least would show enough ore to

justify a mill. The operators quit early in the year. Some production of high-grade ore was made by a few small operators in this district, among whom the work of W. W. Gibson at the *Columbus Mine* was of interest because of the high grade of ore found there.

At the beginning of 1923 the *Bernardi Mine* in the Mokelumne Hill district is reported showing up well at 200 feet in depth. The *Lamphyre Mine*, a mile south of Mokelumne Hill is reported in process of being unwatered. At the *La Fortuna (Lucas) Mine*, on Mokelumne River, a half mile upstream from the bridge on the Jackson-Mokelumne Hill road, work is going on through an adit and winze. The *Comet Mine*, on the river near Railroad Flat, is also said to be making a promising showing. At San Andreas, a small crew is rehabilitating the *Ford Mine*, now called the *Aper* and electric equipment is being planned for unwatering. Work is continuing underground at the *Triple Lode (Blair) Mine* a mile and a half south of Altaville and was carried on during most of 1922. Lack of time has prevented visiting the East Belt mines of the county during 1922.

Numerous small placer mines are active in the county at the beginning of the year. A few men are working at the *McCann Mine* and the *Red Hill Mine* near Mokelumne Hill, and at other properties near San Andreas. At the *Noce Mine*, five miles east of Mokelumne Hill, F. H. Rindge of Stockton is continuing work and is putting up a hoist. The *Glenn Mine*, three miles north of Mountain Ranch, is to be hydraulicked the present season. Just north of Altaville, the *Victor Land and Mineral Company* is operating the mine formerly called the Reiner, through a shaft 360 feet deep. They found that their shaft was on a high reef of bedrock and the inflow of water was so heavy that it was thought impracticable to sink it deeper by the usual method. A flat winze was therefore driven to bottom the channel, and a drift run back under the shaft, which was then completed by raising. Two drifts have been run nearly east to explore the Central Hill Channel and this channel is now being followed upstream. It is reported to be about 80 feet wide. Small blocks of ground that averaged \$5 and \$6 a ton according to Supt. J. A. Montreeville, have been breasted northwest and south of the shaft by this company. These areas were a little higher than the main channel and have been called separate channels by the operators. At present, gravel is being washed in a small mill which is only saving the gold in the free wash gravel. The gravel in this channel is cemented in the channel proper and requires a better mill. The mine is equipped with a good hoist and surface plant. This company plans to drift on the Central Hill channel eastward to the end of their property, about a mile.

There has been some activity on the claims of the *Bishop Estate Company* on the Central Hill channel at Vallecito during the past year. The company has had a great deal of geological work done lately by Mark N. Alling.

There has been no copper production during the year from this county, but the announcement has just been made that the *Calaveras Copper Company*, with extensive mines and reduction plant at Copperopolis, plans to resume work early this year and to make extensive improvements.

Tuolumne County.

Belmont Shawmut Mine between Chinese Camp and Jacksonville, has been the only producer on the Mother Lode in this county during 1922. When last visited in November, this company was running 40 stamps of the mill. The workings have reached a depth of 3213 feet, on the dip, below the apex. A total crew of 125 to 130 men are employed, of whom about 75 work underground. Using the system of reduction described in the last monthly chapter, this company has achieved a low milling cost, and in point of total cost of mining and milling has reached almost as low a figure as that achieved at Carson Hill Gold Mines, where a much greater tonnage is handled.

The mill and surface plant at the *Clio Mine* south of Jacksonville was burned down late in the summer. Plans were announced for rebuilding.

The *Crystalline Mine*, a mile and a quarter from Jamestown on the Mother Lode was unwatered early in the year by the Tonopah Mining Company. The drift on the 600 level has been run north the entire length of the claim. Supt. T. C. Black reports that when the water had been removed, the shaft below the water-line was found to be in almost perfect condition and little expense was required to put the workings into shape for operation. The mine yields about 10,000 gallons of water a day, which comes in mostly on the 300 level. According to Black, no particularly good ore had been developed up to November. The *Alabama* claim, adjoining the Crystalline on the north, will also be prospected by this company.

On Jackass Hill near Tuttletown, the *Chileno* and other claims of a large group have been prospected during 1922 by the Nevada Wonder Mining Company. A shaft has been sunk on the Chileno and a cross-cut adit run in the hill, but without developing ore up to November, according to Superintendent T. C. Black.

Plans were under way late in the year for unwatering the *Omega Mine* near Jamestown. No other activity was noted along the Mother Lode. As far as known, there was little, if any production from quartz mines on the East Belt in this county, although several were being prospected.

STRUCTURAL AND INDUSTRIAL MINERALS.

This section of the state contains many valuable deposits of the structural and industrial minerals, and while some of these have been developed on a good-sized scale, it may be said in general, that these minerals have lagged far behind as compared with the metals. They depend upon conditions that do not restrict the gold miner, whose product is so valuable that he can ignore matters of transportation, and does not need a near-by market for his goods, which are always in demand. With the increase in population on the Pacific Coast that is forecasted by many authorities, and with the accumulation of capital among our own people so that it will not be found necessary to go east to finance our industries, there can not help being a hopeful future for these less spectacular but indispensable members of the mineral family.

Brick and tile are manufactured in large quantities near Ione in Amador County and at Lincoln in Placer County. That section of

Amador County has large deposits of fire clay and white quartz sand that are only partly developed and are well located as regards transportation. The plant of Gladding, McBean and Company at Lincoln in Placer County is one of the largest in the country. They make a wide variety of clay products, including especially architectural and building tile and brick, and sewer pipe. The Lincoln Clay Products Company makes a speciality of shipping crude clay for many uses, from their pit near Lincoln. There are several shippers of crude clay from the Ione district, and one firm makes a speciality of fire brick. The market is limited only by the cost of transportation, which determines whether or not they can compete for more distant business.

Placer County has been known for over fifty years for the high grade of granite produced by the quarries at Rocklin and Penryn, but these have not been very active of late, due to the advent of cheaper but less enduring building materials.

El Dorado County is the principal producer of limestone in this portion of the state, but there are large deposits lying idle in the other counties of the district. The largest producer is Pacific Portland Cement Company's Mountain Quarries property a few miles north of Cool, which furnishes lime for cement. Another large quarry below Shingle Springs has been for many years a heavy producer of high grade limestone for industrial uses.

Plans are under way early in January for the opening of a limestone deposit about two miles from San Andreas, and preliminary work has begun.

Tuolumne County has been noted for its marble for many years, and of late the product has begun to receive the recognition from western architects to which it is entitled. Two quarries are in operation and have found an increasing market during the past few years as the merits of the stone become better known. There are other marble quarries in Amador and Calaveras counties.

El Dorado County has several quarries of black roofing slate of which only one is in operation at present.

Promising chrysotile asbestos prospects have been noted in several counties of the district, notably in Tuolumne, Calaveras, Placer and Nevada. One property near Washington, Nevada County, has been productive for several years past. Another near Copperopolis has been developed far enough to make a promising showing.

Asbestos mining has good future possibilities on this coast, but seems to be hard to finance because of the unwillingness of the large consumers to help open properties, in spite of the high prices they pay for Canadian fiber and the heavy freight rates. At this writing, a plan is under way for the proper financing of the Pacific Asbestos Corporation, owners of the deposit near Copperopolis.

There has been a small production of barytes during the year from one property in Nevada County near Liberty Hill. Other prospects have remained undeveloped as far as known. The new tariff of \$4 a ton on crude barytes and \$7.50 on ground barytes should encourage the opening of known deposits.

Chromite has remained inactive during the past year and only a small production was made from one property in Placer County.

Silica sand has been produced in the past few years at a plant near Ione. Quartz could be produced cheaply from a great many properties

in the district, but the local demand is small and there is only a little production annually in the district.

Soapstone is produced in El Dorado County near Shingle Springs and farther west near the railroad, and finds a market for use in roofing.

A magnesite deposit was opened up near Chinese Camp during 1922, and shipments begun.

SAN FRANCISCO FIELD DIVISION.

C. McK. LAIZURE, Mining Engineer.

REVIEW OF ACTIVITIES IN 1922 WITH NOTES ON THE OUTLOOK FOR 1923.

During the past year field trips were made into Madera, Mariposa, Mono, San Benito, and Tulare counties, and the mining activities in these counties were quite thoroughly covered. Hurried investigations were also made of a few reported activities in Alameda, Contra Costa, Glenn, Napa, San Mateo, and Santa Clara counties.

Routine office work required much of the engineers' time. These duties and the resignation of Mr. E. S. Boalich from the staff in the San Francisco office made it impossible to adequately cover the twenty-eight counties in this district, and the monthly reports on the mines and mineral resources have been unavoidably meager at times.

The San Francisco division takes in the central, western, and valley counties extending from Mendocino and Glenn in the north to and including Monterey, Kings, and Tulare in the south; also Fresno, Madera, Mariposa and Mono on the eastern side of the great valley.

The district includes about three hundred miles of the Coast Range with the foothills and valleys to the east, and a considerable portion of the foothill and high mountain belt of the Sierra Nevada; consequently a great variety of commercial minerals are produced, including most of the structural and industrial materials, as well as the fuels and metals.

In this review, the fuels, petroleum, and natural gas, although in point of value the most important mineral product, will be omitted; developments in the oil fields of the state being found in the résumé of the petroleum industry by Mr. R. E. Collom, State Oil and Gas Supervisor.

METAL MINING.

In the district under consideration gold production comes mainly from Sacramento, Mariposa, and Mono counties, with lesser amounts from Stanislaus, Fresno, Madera, and Merced.

In the production of gold, Sacramento County ranks fourth in the state, with an annual production ranging from one and one-half to one and three-quarter million dollars, obtained almost entirely from dredging operations by the Natomas Company of California at Natoma.

Other gold dredge operators are the LaGrange Gold Dredging Company at LaGrange, Stanislaus County, and the Yosemite Dredging and Mining Company at Snelling, Merced County. The old dredge of the LaGrange Gold Dredging Company was replaced during the year by a new dredge with larger buckets.

The Yankee Hill Gold Mining Company's dredge, which was wrecked in the Stanislaus River below Knight's Ferry shortly after launching in 1920, has been sold and dismantled.

Dredging operations as a whole will show a normal output for 1922.

In Mariposa, Mono, Fresno, and Madera counties quartz mining prevails, but there is also a small gold production from surface placers, particularly in Fresno County. Interest in gold quartz mining in these counties has increased noticeably, new activities being most pronounced in Mariposa County.

The increased activity during 1922, in most cases probably represents money put into the mines in examination work, development and new equipment rather than increases in actual mine output, but after a long period of closure, such expenditures are unavoidable.

The results of renewed activity will no doubt be shown by a comparatively large increase in gold production from Mariposa County during 1923.

The Original Mining and Milling Company at Clearing House and the Virginia Belmont Mine, three miles south of Coulterville, were in operation and producing during 1922. The Bobbie Mining Company were developing. They erected a new mill on their property in the Moore Hill district. The B. V. D. Mining Company did considerable development work and erected a mill at a new prospect about one-half mile southwest of the Bobbie. The Little Wonder Mining Company was developing its property near Hite's Cove.

Two of the most important mines in the south half of the old Mariposa Grant, the Mariposa and Princeton, formerly large producers, have been reopened. The Quail Mine has been examined by Eastern parties, and the Ruth Pierce has been undergoing repairs with a view to early resumption of mining. The San Domingo Quartz Mine has been bonded, and a bond has also been taken on the Honeycomb, St. Gabriel, and Silver Lead mines by the Simpson Mining Company. The 5-stamp mill was overhauled and development work started. The Texas Hill Mining Company has been actively developing their property in the Kingsley district.

In a new adit at the White Oak Mine five feet of good ore was opened up during recent development.

Unconfirmed reports state that arrangements also have been made for the reopening of the old Mount Ophir Mine at Mount Bullion, and a number of other mines in this county. It was at the Mount Ophir Mine that the 50-dollar gold slugs were minted in the early days.

In Madera County the Kroromick Mining Company, owners of the old Texas Flat and other properties near Coarse Gold, have carried on development work for the past several years and have a large tonnage of ore blocked out. This mine should soon be on the producing list. Among the smaller properties at which there was some activity during 1922, may be mentioned the Mud Springs Mine, Hornet's Nest Mine, Eagle Mine, and the Stayton Mining Company. Most of these properties are equipped with arrastras or small mills of some kind. Gold production in Madera County will not noticeably increase in 1922, but it will likely show some improvement during the present year.

The mines in Mono County have always operated under adverse natural conditions due to the rugged topography, lack of transportation

facilities, sparse population and their generally isolated situation. In spite of these handicaps, prospecting and development on a small scale have been carried on, and the outlook for 1923 points to some improvement in conditions.

In the Antelope Valley, or West Walker district, the Golden Gate Mine and mill has been in quite steady operation. The famous Silverado property in the Patterson district has been acquired by the Mono Mines Company, who expects to open it up on a large scale.

In the Masonic district some work has been carried on at the Pittsburgh-Liberty Mine, the Success Mine and at the Faudre and Welsh, and Brownie Groups.

The Visalia Masonic Mining Company opened up some rich ore in their property known as the Chemung Mine, and equipped it with a mill which was put in commission late in the year.

Leasers have been working in a small way at the Standard Mine in Bodie.

At Mono Lake three companies were putting up plants for the recovery of gold from the lake water. Their success is problematical, but if recovery can be accomplished on a commercial scale, such operations would add considerably to the gold output of the county. It is claimed that as high as twenty cents per ton of water has been recovered in experimental work.

Mining in the Benton District has been very quiet, with only a little development work going on at the Comanche Mine and at the Diana Development Company's property.

The Bishop Community Gold Producers Mining Company has been actively developing the Casa Diablo Mine in the district of that name, during 1922. Several thousand feet of development work was completed and the property equipped with a sawmill, electric generating plant, 10-stamp mill, four-mile electric transmission line and eight-mile water pipe line.

In Tulare County, gold, silver and molybdenum properties have received attention. Warner Barnes and Company have reopened the Bald Mountain Mine in the White River district and the 5-stamp mill has been put in shape to run. Preparations have been made by the owners of the Florence G. Mine to renew mining, and both these properties should be producing early in 1923.

The Deer Creek Silver Mining Company started exploratory work on an old silver mine situated eleven miles southeast of Porterville in an unorganized section adjoining the White River district. This mine was last worked in the 60's or 70's, at which time the ore was hauled to Tipton and shipped.

Kaweah Molybdenum Mines Company did a small amount of development work on their molybdenum deposit in the Mineral King district. The property comprises sixteen claims.

Outside of the operations mentioned, the only other metals of importance in the district, as far as activities during the past year are concerned, were quicksilver and manganese. Quicksilver production was almost at a standstill during 1921 and 1922, but there is promise of resumption of mining on a much larger scale and at more mines in 1923 than for some time past.

The McCumber-Fordney Tariff Act, which took effect late in 1922, placed a duty of twenty-five cents a pound or \$18.75 per flask on imports, and this will be of material aid to California operators.

During 1922 the New Almaden Mine in Santa Clara County and the mine of the Western Mercury Company at Cloverdale in Sonoma County were operated on a reduced scale. A small production was also made by Patriquin Bros. from the Dawson Mine, Kings County. Mines that are reported as preparing to resume operations in the immediate future are the Knoxville in Napa County, which will be reopened by H. W. Gould; the St. John Mine in Solano County; the Wideawake, situated on the line between Colusa and Lake counties, by the Consolidated Exploration and Development Company; and the well known New Idria mines in San Benito County.

Quicksilver production for 1922, like that of 1921, will be light, but there will no doubt be a marked increase during the present year.

Two plants for refining or concentrating low-grade manganese ores are in operation, one in Berkeley and one at Redwood City.

The plant in Berkeley, owned by the Consolidated Manganese Company, uses electro-magnetic separation to eliminate silica. The American Manganese Products Company at Redwood City refines silicious manganese ores by a patented chemical process and produces high-grade manganese dioxide, especially suited for dry-cell batteries.

Ore shipped to the above plants came from San Joaquin and Stanislaus counties. No other manganese mining operations were noted in this district.

NON-METALS.

Omitting petroleum and gas, there still remains a large number of structural, industrial, and saline minerals, that are produced in the San Francisco district. Chief among these are cement, miscellaneous stone (crushed rock, etc.), brick and tile (including pottery clay), granite, magnesite, salt, limestone and marl, diatomaceous earth, asbestos, dolomite, feldspar, gypsum, coal and peat.

During the year just passed there has been a growing interest manifested in mineral products of this nature. Freight rates and haulage costs are important factors in the commercial exploitation of the industrial minerals, and the search for supplies close to transportation facilities and the Bay district has been keen.

Established cement plants in this district, one each in Contra Costa, San Benito, Santa Cruz and Solano counties, enjoyed a very prosperous year. Limestone enters largely into the manufacture of the finished material. It is reported that the Riverside Portland Cement Company has acquired a large holding of limestone in Tulare County near Springville. Limestone deposits in Northern California, even though at present undeveloped, suitable for the establishment of cement plants, have a potential value that will no doubt be realized in the near future. The use of limestone for agricultural purposes, as an indirect fertilizer and soil corrective, is increasing in California, and there has been considerable development along this line. A deposit at Jenkins Hill above Bagby has been leased for the establishment of such a plant. The Bernal Marl Fertilizer Company operates a quarry and pulverizing plant near Eden Vale, Santa Clara County. A steam shovel is used in mining. The mill has been rebuilt and enlarged and has a capacity

of 500 tons per day, requiring 500 horsepower of electric energy. In San Benito County the Pacific Coast Steel Company has bonded and is developing a limestone deposit about ten miles southwest of Hollister. A spur track will be run to the property if sufficient tonnage is developed.

Kaweah Lime Products Company has opened up a new quarry face and increased the capacity of their grinding plant at Terminous, Tulare County. From 90 to 175 tons per day of agricultural lime, paving dust and cement pipe stock is produced.

Pennywell & Company of Lemon Cove are erecting a plant at Terminous for the manufacture of a mineral compost composed essentially of limestone, tricalcium phosphate and sulphur.

The Pacific Limestone Products Company of Oakland has purchased the W. Coplatzi limestone property at Santa Cruz, consisting of fourteen acres. This quarry produces considerable agricultural limestone.

The stone industry, including crushed rock of all kinds, paving blocks, sand and gravel and grinding mill pebbles, follows cement in point of value, and forms the next largest subdivision of the structural materials. The larger producing counties in the district, in order, are Contra Costa, Sacramento, Alameda, and Fresno. A portion of the production from Fresno and Sacramento counties is selected pebbles from the gravel beds of the San Joaquin River and from dredge tailings. These are used as a grinding medium in tube mills at metalurgical plants.

The miscellaneous stone industry is on a firm basis and the business in 1922 was probably somewhat greater than in 1921. Prospects for the coming year are excellent.

Clay products, including brick, tile and pottery clays, is another important subdivision fairly well developed in this district and represented by one or more operations in about half the counties included therein.

The California Pottery Company started operations in the first unit of their plant at Merced. They met with success and plans were immediately made for increasing the installation of four kilns, at present operating, to sixteen.

In Contra Costa County, the Pacific Sanitary Manufacturing Company, organized with a capital of \$2,000,000, took over three existing plants, an enameled iron works at North Richmond, and two potteries in San Pablo. Plans are under way for extensive additions and improvements that will increase their capacity about 100 per cent.

The S. P. Brick Company of Exeter, Tulare County, increased the capacity of their plant and now manufactures hollow building tile, as well as brick.

The West Coast Porcelain Company's plant at Millbrae, San Mateo County, has operated steadily, and the plant of the Homer-Knowles Pottery Company at Santa Clara, constructed in 1921, began operations in 1922. The latter company produces high-grade white hotel crockery and chinaware.

Granites of superior quality for building, monumental and ornamental purposes are produced in the district in Madera and Tulare Counties. In Madera the McGilvray-Raymond Granite Company and the Raymond Granite Company have been operating at full capacity supplying granite for various new buildings in San Francisco and Sac-

ramento. The California Granite Company, operating quarries near Porterville, Tulare County, and Rocklin, Placer County, has also been in steady operation. The outlook for continued good business by the granite producers is excellent.

Magnesite is one of the minerals that is mined almost exclusively in the San Francisco Field division, as the bulk of the state's production comes from Fresno, Napa, San Benito, Santa Clara, Sonoma, Stanislaus and Tulare counties. The magnesite industry has been in a rather weak position since war-time activities ended; however, conditions improved in 1922 as compared to 1921, and this improvement bids fair to continue during the present year in even greater proportions.

During the year mining was carried on at the White Rock Mine in Napa County by C. S. Maltby, who has taken it over. The Western Magnesite Development Company's property in Santa Clara County, also under lease to C. S. Maltby, was likewise producing during 1922. Some shipments were made from a deposit near Madrone in Santa Clara County. In Stanislaus County there was one producer on Red Mountain, the magnesite being shipped to Patterson for calcining. Some magnesite was also shipped from Piedra, Fresno County, and the Sampson Magnesite Company produced a little from their deposit in San Benito County. The Sierra Magnesite Company, subsidiary of the National Kellastone Company, operated their mines and calcining plant at Porterville, Tulare County, on a fairly large scale. The Hoff Magnesite Company operated a plant in Oakland, manufacturing magnesite stucco, flooring, etc.

The Tariff Act of 1922 placed a duty on imports of both crude and calcined magnesite, and this has helped to place the industry on a firmer basis.

Asbestos, diatomaceous earth, dolomite and gypsum deposits have received much attention during the year, and there has been considerable development work on deposits of these minerals.

In San Benito County, the California Asbestos Mining Company took a lease and bond on the Long-Ryan Asbestos Mine near Hernandez, and were equipping it with a mill for the production of fiber.

A deposit of chrysotile asbestos, the first recorded occurrence in Napa County, was opened up during the year by James S. Brogan and R. R. Norton. Nineteen claims have been located on what is apparently a large deposit of short-fiber chrysotile.

A number of diatomaceous earth deposits have been investigated, and one or two small producers have been developed in this division. One deposit is near Pinole, Contra Costa County, and one in Sonoma County.

Dolomite has been produced steadily from deposits near Hollister, San Benito County, and gypsum has been developed in Fresno County.

There is a growing demand for practically all of the industrial and structural minerals, and as deposits at present producing are exhausted, others suitably located are eagerly sought.

Impetus was given to the coal mining industry in the district when the Stone Canyon Coal Mine in Monterey County was reopened, in the latter part of 1921. Operations continued during 1922 until after the middle of the year and production reached approximately 200

tons per day. It is reported that the coal had to be rehandled many times between the face and the railroad cars, that mining costs were excessive, and that the mine could not be profitably operated unless at least 500 tons per day was produced. The output could not be raised to that figure, and the mine is again idle. Seventy-five men were employed during the period of active development.

The San Benito Coal Mining Company has been carrying on development on a small scale at their coal mine near Mendota, San Benito County. A 6-foot vein of coal of sub-bituminous character has been opened up.

One of the undeveloped fuel resources of this district is peat. There has been considerable production of peat in California, usually under the name of humus, and used for agricultural purposes, but to date its use as a fuel in California has not been developed. However, there has been some inquiry in regard to the peat resources of California, during the past year, and the following data abstracted from a reprint of Transactions of Commonwealth Club of San Francisco, is informative:

"The large overflowed areas of the interior valleys of California have formerly supported and, except where reclaimed, still support a healthy growth of tule, duck weed, cattail and many other aquatic plants. The entire area both reclaimed and overflowed, must, therefore, be underlaid by peat deposits. The thickest of these is supposed to underlie the area following a line traced around the edge of the marshes and extending from Carquinez Straits to Stockton to Rio Vista, closing at the point of commencement again and covering an area in all of approximately twelve townships, 432 square miles, or 276,460 acres, with peat to a thickness of from six to eighty feet, or an average of forty-three feet. A large portion of this expanse, particularly in the eastern part, has been covered by debris from our early hydraulic mines, while in other portions the peat is more or less sandy. The acreage noted is therefore divided by two, giving as a result 138,248 acres. Of this area 60,000 acres are known to contain good peat to a depth of at least six feet or more. In one acre of land 200 tons of machine dried peat are recoverable for each foot of raw material. The 60,000 acres will therefore contain 60,000 x 6 x 200 or 72,000,000 tons, which will be placed as proved. The 138,248 acres with forty-three feet of peat would contain 138,248 x 43 x 200, or 1,188,932,800 tons. The amount of peat in this area under consideration is given as follows:

| | |
|----------------|--------------------|
| Proved ----- | 72,000,000 tons |
| Possible ----- | 1,188,932,800 tons |

"No attempt has been made at any accurate estimate in the preceding figures, as such would be impossible from any existing data. It is highly probable that a large portion of the 'possible' area will be found unavailable because of mixture with silt. It is also unfortunate for the peat industry that this land is among the most valuable in California for agricultural purposes, as it is questionable if peat products will prove more remunerative than those of agriculture.

"Shallower peat beds are also known to exist in parts of Sutter and Yolo Basins, throughout the marshes on San Francisco Bay, in the marshes near the mouth of the Salinas River and in that portion of Klamath Lake located in California. These areas do not begin to compare in possibilities with those of the lower Sacramento and San Joaquin Rivers."

The principal saline mineral produced in this district is common salt obtained by evaporation of sea water at plants on San Francisco Bay and at Monterey Bay. Alameda County is the largest producer in both this district and the state.

As mentioned previously, a large portion of the engineers' time in this district is taken up in replying to written and personal requests for information relative to the mines and mineral resources of the state. With the publication of lists of mineral products and deposits wanted, and for sale, in the monthly chapters of the State Mineralogist's Report, a fertile field for practical assistance in development was

opened up, and a few words regarding this work may not be out of place.

It was expected that this service would develop into a rather one-sided affair; that is, that there would be a very large excess of materials offered for sale, over those that were wanted by buyers. However, during the entire year, the total number of items, including minerals of all kinds, undeveloped deposits and mines offered for sale, has only exceeded the specific requests for mines of one kind or another, undeveloped mineral deposits or mineral products, by the small total of twenty-six.

This would indicate that there is a strong demand for the commercial minerals, which, if met, must inevitably lead to greater development.

Requests for a source of supply of various products have come from New York, Pennsylvania, New Jersey, Illinois, and other eastern manufacturing states, as well as locally, from both large manufacturing companies and individuals, whose variety of requests easily lead one to believe that everything in the nature of a mineral product is found in California. Fortunately, it is seldom that a correspondent or caller can not be placed directly in touch with producers of the required product or owners of deposits.

Busy individuals and corporations usually accept such assistance as a public bureau of this kind offers, as a matter of course. It is therefore gratifying to note that the files of this office contain a number of acknowledgments of the satisfactory consummation of purchases or sales, directly due to this service, as well as others, stating that negotiations are under way or properties are being investigated.

Of these, some are from prospectors, one of whom has written as follows:

SHOSHONE, CALIFORNIA, January 9, 1923.

CALIFORNIA STATE MINING BUREAU,
Ferry Building,
San Francisco, California.

DEAR SIR: I'm sending sample of mineral in a match box. I would like to know if there is a possible chance of borax being in it—or other salts. It's out of the borax formation here. It means a deal going through if there is any kind of borax in it, with my other borax claims.

I have not received the November and December Monthly Chapters of "Mining in California."

I got in touch with some of the people who want minerals, in your last Monthly Chapter, and I'm sending samples away.

Now I wish to say—whoever gets up the Monthly Chapter of "Mining in California" is surely a master in the mining game—even a rough-neck miner and prospector like me can understand it, and he gets in touch with the mining man and ore buyers, etc. It does more, the chapters, to build up the mining industry than all the newspaper advertisements in a million years—because you get in touch with the buyers—one live mine brings 50 moneyed men in camp like bees in a water bucket. If the funds should run low—and the State don't contribute it—I'll put all I can to keep the Monthly Report a going; and I will rustle more—and if all the prospectors do likewise it will help.

Hoping this meets your good will, I remain

Respectfully,

(Sgd.) ROCKY MT. GEORGE,
Death Valley Prospector, California.

This assistance in development is especially appreciated in the mining of the nonmetallic minerals, the marketing of which differs widely from that of the metals.

A letter was recently received from a company in Detroit, Michigan, which is putting a new automobile accessory on the market. Each instrument will require about one-half pound of quicksilver. This use for the metal is entirely new. As they expect, when in production, to average two thousand instruments per day, their control of a mine or primary source of supply is imperative. It is to such requests that the State Mining Bureau alone can supply unprejudiced and authoritative information.

The Bureau is kept in close touch with industrial demands through these inquiries. Arsenical ores, long penalized by smelters and the bane of cyanide plants, are now wanted, due to the present demand for arsenic as an insecticide in fighting the boll-weevil and other pests. The records and reports of the Bureau, since its inception, are proving invaluable in locating many such rarely-wanted minerals when a demand develops.

It is hoped that the service offered producers and consumers will be even more valuable to the mining industry during 1923 than it was during its initial year, 1922.

LOS ANGELES FIELD DIVISION.

M. A. NEWMAN, Mining Engineer.

REVIEW OF MINING FOR 1922.

Scope of Industry:

This division consists of the following eleven counties in the southern part of the state: San Luis Obispo, Santa Barbara, Ventura, Los Angeles, Orange, San Diego Imperial, Riverside, San Bernardino, Inyo and Kern counties. In area, these counties cover 66,543 square miles.

Among the minerals found in this region are: Antimony, asbestos, barytes, bituminous rock, borax, clay, cement, chromite, diatomaceous earth, dolomite, feldspar, Fullers earth, gems, gold, graphite, granite, gypsum, magnesite, manganese, marble, mineral paint, mineral water, molybdenum, natural gas, petroleum, potash, pumice, quicksilver, salts, silver, soda, stone, strontium, talc, tungsten and zinc.

Reference will only be made to the most important minerals mined during the year, and then only to such salient features as may prove of interest and value to the public.

Production for the Year 1922:

The actual figures for 1922 will probably not be available, as regards the mineral production in this district, until about the middle of this year. However, if we glance at the figures for 1921, we can make a fair estimate of whether there should be an increase or decrease in any particular mineral, if conversant with the general business conditions affecting it. In the April to October number, inclusive, of 'Mining in California' can be found the actual production of any mineral, for 1921.

In 1921, the value of the mineral production of this district was \$213,014,760. Of this amount, approximately \$188,850,696 should be

credited to petroleum and natural gas leaving \$24,164,064 to be apportioned among the other minerals, as follows:

| | |
|---------------------------|-----------|
| Borax | \$338,905 |
| Cement | 4,633,437 |
| Clays, brick, tile..... | 3,941,491 |
| Gold | 383,176 |
| Potash | 211,067 |
| Silver | 3,299,543 |
| Talc | 120,625 |
| Miscellaneous stone | 2,962,127 |
| Balance | 8,273,693 |

Let us now briefly discuss the outstanding features of 1922 production.

Metallic Group. There was practically no production of antimony, chromite, molybdenum, or tungsten during the year.

There was considerable scouting for gold mines, and quite a number of prospects are being reopened. This is especially true in the Randsburg district. In this district the Yellow Aster, King Solomon, Baltie, and Black Hawk operated during the year, and a number of mines in the so-called Stringer zone are being reopened. In the Mojave district, the Yellow Dog Mine is being developed. This property, as a prospect, has a remarkable showing of high-grade gold ore. It lies but a short distance from the old Exposed Treasure Mine, which, in times past, had a large gold production. In the Big Bear region, San Bernardino County, the Gold Mountain property operated both mine and mill during 1922. It was reported the property has recently been sold to an Arizona syndicate. In the Black Hawk district, San Bernardino County, Voorheis and Del Mar are developing the Arlington group of claims. They claim to have a very large tonnage of \$4 ore, which they believe can be profitably worked. It is expected that a milling plant will be erected on this property sometime during 1923. The Zenda Mining Company, in the Amalie district, Kern County, resumed operations during the year, and is now running its 100-ton plant. The Tropico Mine, near Rosamond, also operated steadily during the year.

The rise in the price of lead from around 4¢ to 7¢ during the year was reflected in increased operations in the Cerro Gordo, Darwin and Tecopa lead mining districts. The Cerro Gordo Mines Company operated its 50-ton lead concentrating plant at Keeler to full capacity during the year. The Darwin Mining Company was leased to the Darwin Leasing Company. This company put in operation its 80-ton mineral separation flotation plant, at Darwin. At Tecopa, the Tecopa Consolidated Mines Company operated its 100-ton flotation plant to full capacity. The Carbonate Mine, near Zabriskie, resumed shipments to the smelters, as well as a number of other small properties mining high-grade silver-lead ore.

The silver bearing area of the Randsburg district surrounding the California Rand Silver, Inc., locally known as the Kelly Mine was the scene of much prospecting and shaft sinking, with the hope of finding other ore bodies of the richness and extent that the Kelly possesses. Fully thirty companies are actively mining in this region, some of which have found ore that may develop into bodies of commercial

value. Next to the Kelly, the Coyote, owned by the Randsburg Silver Mining Company, has developed a considerable tonnage of both shipping and milling ore.

The finding of ore in the Silver King shaft at a depth of 580 feet has given much encouragement to many of the companies. Ore of a milling grade is also reported to have been cut in the Grady shaft, at a depth of 975 feet. If this ore be cut again at an additional depth of 100 feet, the statement of some that it is only a one-mine camp will be subject to considerable modification.

Litigation over apex and extralateral rights between the Kelly and Coyote property is having a detrimental effect upon the conservative mining element who would like to enter the camp. While the camp does not possess the feverish activity that was seen at Goldfield, Tonopah or Divide, the general public is getting a much better run for its money, as it is practically all going into real development of the mines, for which the camp is to be congratulated. The dividend distribution of the California Rand Silver, Inc., during 1922, amounted to \$1,100,600, and the total dividends paid in the three and a half years of its existence have amounted to \$2,169,600.

The silver region of the Randsburg district will be treated in detail in a special bulletin to be shortly issued.

The amount of zinc mined during the year was negligible.

Non-Metallics: The most important minerals of this group mined during the year were borax, clay, diatomaceous earth, gypsum, limestone, potash. Cement, though an artificial product, is in this class.

The Sterling Borax Co., at Lang, did not operate during the year. So, practically all the borax produced, can be credited to the Pacific Coast Borax Company, with a small amount made as a by-product for the American Trona Company, at Searles Lake. An item of importance is the construction at present of a refinery at Wilmington, near Los Angeles, by the Pacific Coast Borax Company. This will enable the company to make a considerable saving in freight charges, as at present its borax is being sent to the Stauffeur Chemical Works at San Francisco and to Bayonne, New Jersey, for refining.

The Celite Products Company at Lompoc was the largest producer of diatomaceous earth. The Featherstone Company, at Covina, opened up its deposit during the year and placed its plant in operation and is now in the market with diatomaceous earth products.

The completion of a 25-mile narrow gauge railroad from Maria, a station on the San Diego and Eastern railroad, to the gypsum deposit of the Imperial Gypsum Company, in Imperial County, near the San Diego line, was the outstanding feature of the gypsum industry. At present the Imperial Gypsum Company is shipping 150 to 200 tons a day to the Blue Diamond Materials Company, at Los Angeles. The U. S. Gypsum Company, as usual, supplied the bulk of gypsum used as land plaster and by the cement plants as a retarder, from its deposit at Amboy.

The California Graphite Company, at San Francisquito Canyon, leased its property to the Flake Graphite Company. This company, the latter part of the year, operated the plant and sold graphite in the local market.

The American Magnesium Company is building a 30-mile mono-rail line from its magnesium sulphate deposit to a point 6 miles south of

Trona. It also proposes to build a refining plant at either Los Angeles or San Pedro to manufacture magnesium carbonate and Epsom salts.

The American Trona Company on Searles Lake, resumed the manufacture of potash during the year. The West End Chemical Company, at Searles Lake, also manufactured a small quantity of potash and borax.

Around Owens Lake, the Natural Soda Products Company was the largest producer of soda.

Due to the great activity in building, the cement and sand crushing plants, as well as those engaged in the manufacture of brick and tile, experienced an extremely profitable year.

In the clay industry, an important deposit has recently been opened by the Pacific Clay Products Company, six miles south from Oceanside, San Diego County. This clay deposit, found on the Kelly Ranch, is said to be the equal, both in quantity and quality, of anything thus far discovered in southern California.

Considerable attention was paid to the oil or tar sands in San Luis Obispo County during the year. The California Oil Corporation has erected a 200-ton pilot plant to treat sands from its deposit, 4 miles south of San Luis Obispo.

The American Canadian Corporation also intends to work the sands from its deposit in the Tyber field, using the so-called McClave Process for the recovery of the oil.

Outlook for 1923:

It is reasonably safe to prophesy that both metal and non-metallic mines will be more active during this year than last, with the possible exception of those of silver. As is well known, there now remains but 60 million ounces of silver of the 207 million sold during the war, to be bought under the Pittman Act, and this purchase will probably be concluded sometime during the year. Unless some action be taken by Congress to stabilize silver, there will be nothing to prevent silver in the United States from conforming to the world market price, which now ranges between 60 and 70 cents per ounce.

The McCumber-Fordney Tariff will aid some producers materially, as nearly all the minerals have received additional protection. An example of this is the \$4 tariff placed on silica, which was on the free list before. Quicksilver also receives a protection of 25 cents per pound, or \$18.75 per flask, while under the old tariff it had a 10 per cent ad valorem duty on it.

Another most important factor, which should contribute toward better conditions in mining during this year has been the reduction and stabilization of railroad rates, together with a fairly settled wage scale, thus enabling one to estimate costs of production with more certainty. This will allow many operators to embark in mining enterprises, with much more confidence as to ultimate outcome than in these last few years following the war. In other words, normalcy will more nearly have arrived in 1923.

Labor Situation:

There will probably be no reduction in wages in 1923, the present scale being stabilized, with the possible exception of Randsburg. At Randsburg, today, machine runners receive \$6 to \$6.50 per day, and

as long as the Pittman Act remains in force, this rate will stand. It is quite evident, however, that this wage scale will drop to the general wage level as soon as silver drops to the world market price. Due to the activity in the building trades and manufacturing industry, and also aided by the present immigration act, it does not appear as though there will be much surplus labor seeking employment at the mines. While, before the war, mine labor was among the best paid in the United States, today it can not compete against the building trades and many industries, and, as a result does not attract as good a class of men, as formerly.

Generally Recognized Needs of the Industry:

Cheaper power and better transportation facilities will do more to develop our mineral resources than anything else. Inasmuch as most of the mines are so widely scattered, especially in the desert regions, the cost of constructing power lines and building roads to districts containing but one or two small mines, would be prohibitive. With the general development and populating of the country, power lines and roads would be built and the small mine or camp will then be able to take advantage of such to its own economic benefit. The potential wealth of the desert regions is immense, but its exploitation must necessarily be gradual and subject to the economic laws of production.

OIL FIELD DEVELOPMENT OPERATIONS.

R. E. COLLOM, State Oil and Gas Supervisor.

FEATURES OF 1922 PRODUCTION.

California broke all previous records in the production of 139,000,000 barrels of petroleum during 1922. This is an increase of 24 million barrels over the production of 1921. It represents one-fourth of the crude oil produced in the entire United States. The State Oil and Gas Supervisor estimates that the quantity of refinable crude produced alone, crude above 20 degrees Baumé, almost equalled the entire 1920 production of all grades of crude, which was 105,700,000 barrels.

The great increase in the production of refinable crudes is due to the flush production taken from the three intensively drilled new oil fields of Los Angeles and Orange counties. The total production of these fields was 41,000,000 barrels, distributed as follows: Huntington Beach, 11,500,000 barrels, Long Beach, 18,300,000 barrels, and Santa Fe Springs, 11,200,000 barrels. Santa Fe Springs, with 75 producing wells, and Long Beach, with 135 producing wells, are each producing more oil than the entire Midway-Sunset district which covers an area of 46,000 proved acres and has 2600 producing wells.

The rapid drilling in southern California caused a reduction in the price of crude in July, 1922, to 60 cents per barrel, for oil under 20 degrees Baumé. From that time the price remained firm until January, 1923. On January 5, 1923, prices of the lighter grades of crude, above 20 degrees Baumé, were reduced. This reduction, being placed upon the lighter grades only, caused that portion of the state's petroleum coming from the flush production of the new fields to bear its just burden of the general situation of overproduction. The price reduction ranged from 1 cent a barrel on oil of 20 to 20.9 degrees Baumé to 50 cents on oil of 35 degrees Baumé, and above.

Consumption has been greatly increased by shipments of crude and fuel oil to the Atlantic Coast via the Panama Canal. Existing differentials in prices and transportation costs between California crudes and the so-called Mexican light crude are enabling California marketers to ship oil in quantities estimated as high as 50,000 barrels daily. This condition has created a new outlet for California petroleum.

California production still leads consumption by about 2,000,000 barrels monthly. In addition it is estimated that 2000 wells, with a normal output of about 72,000 barrels, are shut down. A large part of the oil shut in is heavy grade, less than 20 degrees Baumé. Oil in storage at the end of December, 1922, was about 1,000,000 barrels in excess of the storage of May, 1915, the previous high point for stored oil. Production at the close of 1922, not including potential production shut in, was 170,000 barrels in excess of the average production increase over the period 1911 to 1921, inclusive, and consumption was 35,000 barrels in excess of the average consumption increase over the same period.

Drilling was concentrated in the Huntington Beach, Long Beach and Santa Fe Springs oil field during 1922 and greatly curtailed in the other fields, especially in the San Joaquin Valley. Very few wells are being drilled in the oil fields of Fresno, Santa Barbara and Ventura counties. On the whole, however, more new wells were reported to the State Oil and Gas Supervisor in 1922 than in 1921. 1439 new wells were reported in 1922 and 1287 new wells in 1921. 799 new wells, 55 per cent of the drilling of the State, were reported in the three new fields: Huntington Beach, 193 wells, Long Beach, 348 wells, and Santa Fe Springs, 258 wells.

The present situation of overproduction in California is due primarily to the competitive drilling of offset wells on or adjoining small property holdings. In the development of each of the three new fields town-lot drilling has played a predominating part. Town-lot drilling should not be confused with close drilling or small acreages per well. The spacing of wells in several California fields, such as Kern River and McKittrick, are on an average basis of 2.0 to 2.4 acres per well. In these fields, however, are ten, twenty and forty acre tracts, or larger, in which wells were spaced according to what the operator considered was the most economical plan for extracting the oil.

In town-lot drilling every well is in a sense an offset well. The size and shape of the property controls the spacing of offset wells. They may be only 50 feet apart. Offset wells are not drilled so much for the purpose of developing and producing that oil to which each operator has an unhindered right, within his own property lines, as to get the oil lying under each side of the boundary line, which will move to the well first drilled into the oil sand. This condition is one of the recognized fundamentals of oil field development, and where properties are leased, the leases carefully safeguard each lessor's interest as opposed to the adjoining lessor. The necessities of drilling offset wells, to meet lease requirements, is therefore, one of the greatest contributory factors to forced drilling where small property ownerships are involved.

Intensive offset drilling necessitates abandonment of the principle of leaving certain quantities of recoverable oil in its underground storage until the maximum profit can be obtained, and then bringing the oil to the surface by drilling the wells according to established oil field

practice, as to spacing and careful drilling methods. Wells are raced to production and each new producing well calls for a number of offsets.

In the town-lot oil fields wells have been drilled as close as three to an acre. Town-lot drilling brings rapid recovery of flush production. For the industry as a whole it means serious over-production. For the operator drilling in congested areas there is not enough oil underground to yield a profit for all against the cost of each well, the productive unit.

The rate of production of California petroleum has its high and low points, like every other oil producing district, in the inexorable workings of the law of supply and demand. It would seem possible, however, by careful study of development problems and intelligent effort, to level off some of the extremely high and low points in the curve. Sometimes, when oil is badly needed, as in the war period, operators do not know where to get it, or how best to get the maximum output with minimum use of money, men and materials. In the present condition much oil is available but it is being produced like a big gusher out of control, because there is not the proper economic machinery to regulate the flow.

It is possible that some of the economic evils of town-lot drilling could be eliminated by carefully considered legislation. Such legislation should recognize the equitable right of every property owner in the oil under his land, whether a small lot or ten acres, and should rigorously prevent the exploitation of California's most valuable mineral resource by the stock jobbers and "uniteers."

From December 9, 1922, to and including January 13, 1923, the following new wells were reported as ready to drill:

| Company | Sec. | Twp. | Range | Well No. | Field |

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau, as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff containing much information that will add to the permanent value of the Monthly Chapter are included in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

PRIMARY AND SECONDARY GOLD CONCENTRATIONS.

By CHAS. S. HALEY.

Concentrations of placer gold may generally be divided into two classes—those that are original and those that result as a secondary concentration of original ones. Under the first head we have primary stream bed erosion. A stream that is wearing down to its basal plane through a mountain range will in the course of many thousand years concentrate and segregate material from pockets and seams, as well as the larger ledges, extending through an enormous mass of ground. Many billions of tons of material may be sorted over by aerial and aqueous action and the residue thereof amounting to anywhere from 2 to 50 per cent of selected portions of the mass will be concentrated in the narrow gorge of the stream.

In the course of this concentration the most of the soluble constituents of the rock mass are removed. Pyrites, galena, and other sulphides are broken down and dissolved by the descending surface waters. Gold associated with these sulphides, being insoluble, simply descends by gravity to the lowest portion of the trough of the channel, in many cases taking ages of time to reach the bottom level. This solvent action is largely assisted by intensive frost conditions and the subsequent heat of the sun. The most insoluble constituents of the rock are clay and quartz, and as a rule these two will be found represented in all types of gravel.

Another type of primary concentration is that due to the erosion of a dike in place. Most intrusive dikes upon cooling have been cracked and the cracks have filled with stringers and cross veins running in all directions. If the magma beneath has been gold-bearing, these stringers often carry gold in considerable quantity. As the whole dike mass is planed off by atmospheric and water action, regardless of any one particular stream channel, a concentration will often occur on flats and plateaus which are not far removed from and often directly represent the original source of, the concentrated material. At Fresno, in the United States of Colombia, the writer has seen concentration of this sort from stringers in granite. The gravel consisted of about five feet of sub-angular soft granitic material and sand. Underneath these, torrential rains prevalent in the tropics had softened the granite for

a depth of from eight to ten feet. As a result, in order to recover any of the gold, it was necessary to sluice off the entire bed rock until undecomposed material was reached.

In California one of the best examples of primary concentration is in Holcomb Valley in San Bernardino County. Here a belt of mineralized porphyry extending in an easterly and westerly direction through Gold Mountain has been washed and concentrated along the sides of a comparatively shallow and wide basin.

A third type of primary concentration is exhibited in Alaska in the vast terminal moraines of the Yukon River basin. The gravel as a whole is very spotted and irregular in gold content and is not commercially profitable.

We now come to secondary concentrations, which probably represent the types of gravel commercially exploited in most of the placer mining districts of the present day. In the Sierras of California the system of Cretaceous rivers, which originally concentrated the gold from the metamorphic rocks thrown up by the Sierra uplift, have been crossed and recrossed at right angles by the present Quaternary system of drainage. As a result of this condition, the fabulously rich placers of the early days of California were formed. A single Quaternary stream in a bed not over fifty feet in width in many cases represented the concentration of half a mile of Cretaceous stream bed. Often gravel carrying this gold had been disintegrated and worn by attrition so much that only two or three feet of material needed to be worked in order to obtain the product of thousands of billions of tons of country rock, which had been concentrated and reconcentrated for thousands and even millions of years.

In Colombia, in Venezuela, the Guianas, and also in Ecuador, Peru and Bolivia, to a lesser degree these same conditions of secondary concentration have existed, but for some reason the primary concentrations seem to have produced the greater proportion of the placer gold that has been won from these countries. From the writer's observation, a reason for this is that the Cretaceous and Tertiary channels which have been concentrated by Quaternary streams in a manner analogous to California, have generally had their drainage through territory which was not auriferous.

The transportation and deposition of placer gold are governed by laws which at first glance seem rather complicated, but in analysis of these principles we find that they are quite simple. Streams that are heavily loaded with sand and mud will naturally have greater transporting power than the streams that are clear, their velocity depending largely upon their grade and cross section, and as these two elements vary greatly at short distances in all mountain streams, it is natural that the amount of gold that the stream is capable of carrying at the bottom of its current will vary greatly, causing more or less irregular distribution. Often in the case of streams of intermittent flow of varying magnitude caused by changing conditions, there will be recurrent stratas of gravel, which contain alternate barren areas and concentrations of gold. During the volcanic period this condition was largely emphasized in the Sierras by the frequent showers of ash, mud and detrital material, which at frequent intervals blocked and choked the streams, causing them to abandon and resume certain definite courses at irregular intervals.

As a rule, on the short turn of a river where the bed rock is sloping out toward a gentle curve and where the force of a current is lessened, we will find the greater concentrations of gold; conversely, on the long turns where the outside portion of the current moving at greater velocity has cut into bed rock, we do not find any great concentrations of gold because conditions have not been favorable for its lodging.

Where a rib of hard bed rock crosses a stream, causing a change in its grade, gold does not generally lodge on the upstream side. The force of the current will drag it over the crest of the ridge and deposit it on the downstream slope. Pot holes in rivers that have any considerable grade, as a rule are absolutely barren. Small crevices, with their upper ends pointing upstream, if they run transverse to the direction of the current, will form natural riffles for heavy gold. As a rule, heavy gold does not travel very far from its source. Fine gold travels very readily. This is very clearly evidenced on the American River in California, especially on the middle fork. For many years the short turns and bars formed near the flood-line of the river have been worked and reworked by rockers year after year. The same condition existed at Posepny in Hungary, and notably so on the Snake River in Idaho.

The concentration varies inversely as the distance from the source of the gold, whether primary or secondary. A river system is constantly working toward a grade or basal plane, which is continually being lowered. This tends to deposit values in fine gold lower and lower down the river. A case in point is noted in the deposition of the famous dredge placers of Oroville. Here the bed rock, however, is mostly tuffaceous, and it is quite possible that underneath this bed rock courses of the old Cretaceous rivers at great depth contained richer gravels than those that have been worked above. The difficulties in the way of prospecting and operating this material are such that it is extremely doubtful if it will ever be a commercial proposition to work. Prospecting an area like this is too much like operating a punch board—the amount of money put in is apt to be considerably more than the result is worth.

In general, it may be said that coarse gold as a rule is associated with gravel that contains the heavier constituents of the original rock; whereas fine gold is often and even generally associated with sand, clay, and light material. A case in point was noted by the writer on Portage Creek on the upper reaches of the Little Delta River in Alaska. Portage Creek drains the area of glacial moraines in the basin of the upper Tanana for an area of perhaps 50 square miles. There is no bed rock visible and the stream basins are all in gravel. At the bottom of the Portage Creek drainage there is a streak about six inches in depth lying on what may be termed "an original gravel bed rock," which carries a small amount of heavy gold. Above this streak there are four or five feet of light sand and pebbles. One or two fine colors to the pan is the average run of the upper gravel.

SECRETARY'S OFFICE.

W. W. THAYER, Secretary.

The California State Mining Bureau was created April 16, 1880, by legislative act. In March, 1893, the original act was repealed and an amended act approved and passed by the legislative body. Again on June 16, 1913, a new Mining Bureau Act was approved which became effective August 10, 1913, repealing all former acts, and forming the basic law under which the Bureau now functions.

It is doubtless true that both the mining and lay public have not in the past always recognized the part played by the Bureau in the development of the state's mineral resources. Innumerable inquiries regarding them, originating within and without its borders and in foreign countries, have been answered with ultimate results reflected by a consistent growth in the value of the state's mineral output since the records of production were first compiled by the Bureau in 1887.

It is believed that a better understanding of the economic position occupied by the Bureau will be imparted to the public, whose funds support it, by embodying in the Monthly Chapter a review of the executive activities.

The responsibility for the coördination of effort of each department, to the end that the utmost efficiency may be maintained with the limited and variable appropriations accorded the Bureau by successive legislatures, rests upon the office of Secretary.

Activities referable to that office, such as reports of new maps and publications issued, amount of mail handled, changes and enlargements in offices, changes in personnel of the staff, property and equipment, financial statements, etc., are therefore included herein.

New Publications.

During the month the following Bureau Publications have been made available for distribution:

Summary of Operations. California Oil Fields, October, 1922, Vol. 8, No. 4.

Mining in California, October, 1922, Vol. 18, No. 10.

Distribution of Publications.

The Bureau's publications are constantly in demand, requests for copies coming from all over the United States and foreign countries.

Publications were distributed during the month as follows:

| Publications | Number distributed |
|---|--------------------|
| Report XIV. State Mineralogist | 2 |
| Report XV. State Mineralogist | 5 |
| Report XVII. State Mineralogist | 6 |
| Mines and Mineral Resources of Colusa, etc. | 1 |
| Mines and Mineral Resources of Del Norte, etc. | 1 |
| Mines and Mineral Resources of Fresno, etc. | 6 |
| Mines and Mineral Resources of Imperial, etc. | 2 |
| Mines and Mineral Resources of Alpine, etc. | 6 |
| Mines and Mineral Resources of Butte, etc. | 2 |
| Mines and Mineral Resources of El Dorado, etc. | 1 |
| Mines and Mineral Resources of Los Angeles, etc. | 4 |
| Mines and Mineral Resources of Monterey | 1 |

| Publications | Number distributed |
|---|--------------------|
| Mines and Mineral Resources of San Bernardino, etc. ----- | 2 |
| Mines and Mineral Resources of Nevada County ----- | 1 |
| Mines and Mineral Resources of Plumas County ----- | 1 |
| Mines and Mineral Resources of Sierra County ----- | 1 |
| Bulletin No. 6, California Gold Mill Practices ----- | 2 |
| Bulletin No. 37, Gems, Jewelers' Materials, Ornamental Stones of California ----- | 11 |
| Bulletin No. 50, Copper Resources of California (Revised) ----- | 6 |
| Bulletin No. 72, Geologic Formations of California ----- | 22 |
| Bulletin No. 75, United States and California Mining Laws ----- | 10 |
| Bulletin No. 76, Manganese and Chromium in California ----- | 1 |
| Bulletin No. 78, Quicksilver Resources of California ----- | 5 |
| Bulletin No. 85, Platinum Resources of California ----- | 6 |
| Bulletin No. 89, Petroleum Resources of California, with special reference to unproved areas ----- | 61 |
| Bulletin No. 90, California Mineral Production for 1920, with County Maps ----- | 50 |
| Mining in California (Monthly), Vol. 18, No. 10, October, 1922 ----- | 3000 |
| Mining in California (Monthly), Vol. 18, No. 9, September, 1922 ----- | 50 |
| Summary of Operations, California Oil Fields (Monthly), Vol. 8, No. 3, September, 1922 ----- | 3000 |
| County Maps and Registers of Mines ----- | 6 |
| Copper Deposits Map ----- | 2 |
| Inyo County Geological Map ----- | 6 |
| Tuolumne County Mineral Map ----- | 2 |
| Geological Map of California, mounted ----- | 15 |
| Lake County Map ----- | 2 |
| Oil Field Maps ----- | 470 |
| Map accompanying Bulletin No. 89 ----- | 38 |

Mails and Files.

The Bureau maintains in addition to its correspondence file a mine report file which includes reports on some 7500 mines and mineral properties in California. Also there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the month 768 letters were received and answered. They are practically all requests for information and the inquiries cover all phases of prospecting, mining and developing mineral deposits, reduction of crude minerals and marketing of refined products.

Drafting.

The Bureau maintains an up-to-date drafting department, where topographic and geological maps, tracings, oil well logs, and oil field maps are prepared.

DIVISION OF MINERALS AND STATISTICS.

STATISTICS, MUSEUM, LABORATORY.

WALTER W. BRADLEY, Statistician and Curator.

STATISTICS.

Estimate of 1922 Output.

The total value of the mineral production of California for the year 1922, just closed, is conservatively estimated to have been approximately \$257,351,690. This is, in part, detailed in the tabulation below; but, as there are more than fifty mineral substances on California's commercial list, it is impractical at this early date to obtain definite figures on other than the more important items. The blank report forms have been mailed out to the operators in all mineral lines, and the date of publication of the final and complete report will depend upon the promptness of their replies. The State Mining Bureau urges the hearty cooperation of all concerned, to the end that the results may be made known early.

This estimated total of \$257,351,690 is a decrease of \$10,805,782 from the 1921 production, due mainly to lower prices prevailing for crude petroleum, and an apparent decrease of nearly a million dollars in the gold yield. Preliminary reports indicate a record yield of approximately 139,000,000 barrels of petroleum; but, as production was considerably in excess of consumption, the prices for all grades dropped accordingly. This resulted in lowering the average price, although the increased yield was of the higher-gravity oils and especially in the later part of the year. We have estimated an average value, at the well, of \$1.60 per barrel for the first six months of 1922, and \$1.21 per barrel, the second half; the amounts being 61,000,000 barrels and 78,000,000 barrels, respectively, for the two periods. This gives an average of \$1.375 per barrel for 1922 as against \$1.804 per barrel in 1921. This results in a net decrease of slightly over \$12,000,000 in total value.

Though reports from the gold mining districts have, for the most part, been indicative of renewed interest and renewing operations, receipts of bullion at the mint and smelters show a decrease for the year. This was in part due to the Argonaut mine fire, and to a slight decrease in dredge yield. Silver, mainly from the Randsburg district as in 1921, showed a small decrease from the high point of the preceding year. Copper shows an increase to nearly double the 1921 figure, owing to the resumption of shipments by the Walker mine in Plumas County and the continuity of operations by its neighbor, the Engels group. Lead and zinc increased materially, both in quantity and value; as did also quicksilver in a lesser degree.

Magnesite shipments increased about 25 per cent, owing to improvement in the demand for plastic purposes. As the demand for building materials was active during 1922, the structural group (brick, cement, building stone, crushed rock, etc.) showed some increase in value over 1921. There were no notable changes in the general status of the miscellaneous "industrial" group; nor among the salines, except borax. The last-named recovered, in part, from the slump of 1921, and the present market is reported favorable for a continuation of activity.

The estimated quantities and values for 1922 are tabulated as follows:

| | |
|-----------------------------------|--|
| \$14,900,000 | gold. |
| 3,200,000 (3,200,000 fine oz.) | silver. |
| 3,035,100 (22,650,000 lb.) | copper. |
| 356,250 (6,250,000 lb.) | lead. |
| 206,340 (3,620,000 lb.) | zinc. |
| 217,000 (3,500 flasks) | quicksilver. |
| 58,500 (650 fine oz.) | platinum. |
| 191,000,000 (139,000,000 bbl.) | petroleum. |
| 5,250,000 (75,000,000 M. cu. ft.) | natural gas. |
| 629,000 (59,100 tons) | magnesite. |
| 33,000,000 | brick, cement, building stone, crushed rock, etc. |
| 2,750,000 | miscellaneous "industrial" minerals. |
| 2,750,000 | salines (including borax, potash, salt, soda, etc.). |
| <hr/> | |
| \$257,351,690 | Total value. |

MUSEUM.

The Museum of the State Mining Bureau possesses an exceptionally fine collection of rocks and minerals of both economic and academic value. It ranks among the first five of such collections located in North America; and contains not only one or more samples of most of the known minerals found in California, but many specimens from other states and foreign countries as well.

Aside from those visiting it for its purely educational features, the Museum daily attracts scores of tourists and travelers, and furnishes visual evidence of the well-nigh unlimited mineral resources of California. During the past 30 days a total of 527 visitors signed their names to the Museum register, and in addition there are many others daily who fail to take note of our request for their signatures. It is interesting to note how widely spread are the home localities of these visitors. In addition to nearly every county in California, there were thirty states, Alaska and Hawaii represented, as well as 15 foreign countries. Outside of California, Nevada led with 18 names; followed by Canada and Alaska, 15 each; Washington, 14; Oregon, 13; New York, 12; Ohio, 11; and Alabama, Colorado, Idaho, Illinois, Indiana, Iowa, Kansas, Kentucky, Maryland, Massachusetts, Michigan, Minnesota, Mississippi, Missouri, Montana, Nebraska, New Hampshire, New Jersey, Oklahoma, Pennsylvania, Rhode Island, South Dakota, Texas, Wisconsin, Wyoming, each showing from one to eight names. The following foreign countries, besides several provinces of Canada (including Alberta, British Columbia, Manitoba, Quebec, Saskatchewan and Yukon), are represented: Australia, Belgium, Costa Rica, Denmark, England, France, Germany, Honduras, Hungary, India, Japan, Java, Russia, San Salvador, South Africa.

Mineral specimens suitable for exhibit purposes are solicited, and their donation will be appreciated by the State Mining Bureau as well as by those who utilize the facilities of the collection. The Bureau supplies a set of forty typical minerals and ores, appropriately labeled, for study purposes to any public school in the state upon request.

Among the specimens received recently, and catalogued for the Museum, are the following:

19750. *Dolomite*, high grade. From San Benito County, by C. L. Votaw, San Francisco.

19751. *Chrysotile Asbestos* (hydrous magnesium silicate, fibrous serpentine). From Melike Mine, on Coffee Creek, 2 miles north of Carrville, Trinity County, Cal., by Geo. M. Nelson, San Francisco.

19753. *Mica* (Muscovite, aluminum-potassium orthosilicate). From Peteca, Rio Arriba County, New Mexico, by Geo. M. Nelson, San Francisco.

19754. *Quartz* (silicon dioxide). Crystal. From 88' level stope, Bunker Hill Mine, Amador City Amador County, Cal.

19755 to 19761. Inc. *Tetrahedrite* (copper-antimony sulphide approaching Tenacanthite, on account of high arsenic content. Fine, large crystals; *Quartz* (silicon dioxide, crystals with *Chalcopyrite* (copper-iron sulphide); *Chalcopyrite* (copper-iron sulphide) 2 Fes. Crystals; *Pyrite*, *Chalcopyrite*, *Quartz*, and *Dolomite*, showing successive deposition in order named; *Bornite* (copper-iron sulphide); *Galena* (lead sulphide) silver-bearing; *Pyrite* (iron disulphide, crystals, with *Dolomite*). From Morococha Mine, of Cerro de Pasco Mining Co., Cerro de Pasco, Peru, by Thomas A. Gill, Grass Valley, Cal.

19762. *Carnotite* (hydrous potassium, uranium, vanadium oxide). Massive. An unusually fine, high-grade specimen. From Copper Prince Mine, Roc Creek, Montrose Co., Colorado, by Ernest Schernikow, San Francisco.

19763. *Topaz* (aluminum fluo-silicate). From near Ramona, San Diego County, Cal., by Ernest Schernikow, San Francisco.

19764. *Copper, native*. From Arizona, by Ernest Schernikow, San Francisco.

19766 to 19780 Inc. *Lignite Coal*. Vein ranges from 2' to 11' thick between clay beds. Stated to give good results as powdered fuel; *No. 10 Clay*. White-burning; used in terra cotta bodies, face brick, garden terra cotta, flue lining etc.; "Red Bone" *Clay*. A 'bastard fire-clay' somewhat iron-stained, but quite refractory. Used in 'saggers' (clay pans in which potters burn wares to protect them from direct flames in kilns), also mixed with other clays in making sewer pipe; "Pink Mottle *Clay*" red-burning. Used for sewer pipe, roofing tile, hollow tile, and in mixes of vitreous brick, paving, face and rug brick, et al.; "E 101 China *Clay*." A fine-grained china clay, is obtained by washing, suitable for sanitary and porcelain wares. Also used as component of stoneware bodies, art pottery and novelty wares; "Yellow Owl Cut" *Clay*. Buff or red burning. Suitable for face or rug brick mixtures, hollow tile, roofing tile etc.; "Select West Blue" *Clay*. Cream or buff burning. Used for face brick, rug brick, terra cotta, ladle brick, roofing and hollow tile, etc.; "Red Mottle" *Clay*. Red-burning. For roofing and hollow tile, etc.; "Main Tunnel" Fire *Clay*. Refractory, sandy; used for fire brick, locomotive blocks and refractories; "SH4 Ball *Clay*." Very plastic, white-burning. Used in chinaware and porcelain mixes, china, insulators, etc.; "SH3" *Clay*. White-burning. Suitable for terra cotta, faience tile body, face brick garden pottery, etc.; "Extra Select Main Tunnel" *Clay*. A refractory fire-clay. Used for high-grade fire brick, also saggers, face brick, etc.; "Hill Blue" *Clay*. One of most useful. Used for faience tile body, terra cotta, garden and art pottery, stoneware, face brick, etc.; "West Tunnel Blue" *Clay*. Used for sewer pipe, hollow tile, etc.; "Hard Bone" *Clay*. A highly-aluminous fire-clay. Used for high-grade and extremely refractory fire-brick. From Alberhill, Cal., by Alberhill Coal & Clay Co., Alberhill, Cal.

19781. *Placer Gold*. From Magalia, Butte County, Cal., by Highland Chief Mine, Carl A. Phelps, Manager, Magalia, Cal.

LABORATORY.

FRANK SANBORN, Petrologist.

During the thirty-day period covered by this report, 211 samples were received and determined.

A list of those of possible commercial value, judged from the sample submitted only, is appended.

The Bureau will supply the name and address of the party who sent in any of the samples listed, upon request, if the reference number is given.

15-1 Iceland spar.

15-2 Talc-schist.

15-3 Copper ore; some silver and gold present.

15-4 Quartz containing lead vanadate; some silver present

15-5 Clay; alumina content fairly high.

15-6 Limonite; (paint pigment).

15-7 Gold-silver ore; contains pyrite and galena.

15-8 Quartz crystal.

15-9 Gypsum.

15-10 Silicified clay: burns white.

15-11 Lazulite.

15-12 Magnesite.

15-13 Massive garnet.

15-14 Highly kaolinized rock; (white-burning clay).

LIBRARY.

E. COONEY, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received during the month, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the state are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

Western Sentinel, Etna Mills, Cal.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of consumers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them, have been made known to those looking for raw mineral products.

Sufficient publicity has not heretofore been given to this feature of the Bureau's work, but in 'Mining in California' a suitable medium is provided for current inquiries of this nature, and, therefore, written or verbal inquiries that come to the attention of the Bureau are summarized in each issue.

The name of the product wanted or offered, only, is published; the name of the owner of the deposit, or buyer, and other details being supplied upon request.

In writing, the reference number of the item should be given.

Mineral Products or Deposits for Sale.

- 12-1 Graphite deposit.
- 12-2 Large gold property; or will lease.
- 12-3 Mica; average size sheets 2" x 2½".
- 12-4 Clear quartz crystals.
- 12-5 Montmorillonite (rock soap); 500 feet to railroad.
- 12-6 Colemanite; five miles from Shoshone.
- 12-7 Fluorspar; can furnish large quantity.
- 12-8 Magnesite.
- 12-9 Manganese ore.
- 12-10 Strontianite.
- 12-11 Arsenical iron oxide; high in arsenic.
- 12-12 Potash feldspar (orthoclase).
- 12-13 Large deposit of arsenic.

Mineral Products or Deposits Wanted.

- 13-1 Arsenical ore; tonnage.
- 13-2 Gold mine; placer or quartz that can be developed on a rather large scale.
- 13-3 Bentonite (rock soap).
- 13-4 Earth colors; green, blue, yellow, orange, purple, etc; tonnage.
- 13-5 Molybdenum: 85% MoS₂; 25 tons per month.
- 13-6 Beryl mineral (not gem quality). 25 tons or over per month.
- 13-7 Lithia ores; 100-ton lots. Amblygonite 8-9% LiO₂; Spodumene 6-7%; Lepidolite 4-5%.
- 13-8 Molybdenum; deposit or tonnage.
- 13-9 Manganese; deposit or tonnage.
- 13-10 Arsenic; deposit or tonnage.
- 13-11 Quicksilver; deposit or tonnage.
- 13-12 Bismuth; deposit or tonnage.
- 13-13 Tungsten; deposit or tonnage.
- 13-14 Lump pumice; 1" to 1½" lumps and up; tonnage.

EMPLOYMENT SERVICE.

Following close upon the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau contemplates registering technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of applicants for positions and 'positions open,' received by the Bureau during each 30-day period preceding the date of publication of the Monthly Chapter is carried in each issue.

Each notice is designated by a key number, and communications sent to the Bureau in reply to any notice will be forwarded to the proper party without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss.

Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 11-1 Assayer. Technical course completed. Age 29; single. References. Salary wanted \$125.
- 11-2 Manager or Superintendent. Reads, writes and speaks Spanish fluently. Age 42; married. References. Salary wanted \$300 minimum.
- 11-3 Junior Mining Engineer or Geologist. Technical graduate. Two years experience. Age 24; single. Reference. Salary wanted \$150 minimum.
- 11-4 Accounting—office work. Sixteen years experience as chief accountant and auditor. Age 57; single. References. Salary wanted \$150-\$175.

During the month one opening was brought to the attention of qualified applicants.

PUBLICATIONS OF THE CALIFORNIA STATE MINING BUREAU.

During the past forty-two years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield; Auburn, and Redding. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the State may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the State. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive forward step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922.

A monthly publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff are included. Mineral production reports formerly issued as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance are reported monthly. The assistance formerly given to producers and consumers by consultation or correspondence only, is also proffered through this medium.

While current activities of all descriptions will be reported in this Monthly Chapter, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added to that list in the future as they are completed.

The Monthly Chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful latent resources of the State of California.

'Mining in California' is sent without charge to those on the Bureau's exchange list and to all others who make written or verbal request.

Pages are numbered consecutively throughout the year, and an index to the complete reports will be included annually in the December number.

TO THE MINING PUBLIC.

The miner is by nature a pioneer and as such, the mining fraternity has evolved into a group whose thoughts have been governed by the pioneering spirit and whose individual activities have been largely independent.

This typical American spirit also dominated commercial and other industrial enterprises for many years, but during the last few decades the leaders of industry and commerce have learned that there are many advantages to be gained by cooperative associations that develop a closer relationship between man and man.

The miner, as a rule, still clings to the idea of independent action, but it is my belief that he can solve many of his problems and help relieve the industry, as a whole, of some of its burdens by working for the good of all through closer cooperation with every agency maintained for the benefit of the mineral industry. In California for the past forty-three years the State Mining Bureau so far as it has been able has rendered service to the large and small operator, the investor, and the prospector.

The service given by the State Mining Bureau is thoroughly discussed in the November 1922 issue of 'Mining in California' by Fletcher Hamilton, retiring State Mineralogist.

It is my belief that those in whose behalf the Mining Bureau functions have not always taken full advantage of the opportunity for cooperative effort, and it is my desire to assist in every possible way in bringing the Bureau into closer mutual relations with every individual interested in any phase of the development of our immense mineral resources. To that end constructive criticism of the State Mining Bureau's work is invited and specific suggestions, wherein a more economical and efficient plan can be devised for carrying on the functions of the Bureau, will be given full consideration.

The united efforts of the State Mining Bureau and those directly and indirectly affected by the condition of this basic industry in California, alone, can give to the mining industry that feeling of strength that will bring it the recognition it deserves from the commonwealth.

With this object in view, it will be my endeavor to cooperate with, and render every aid possible within the scope of the Bureau's activities to one and all.

LLOYD L. ROOT,
State Mineralogist.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each division working out from a local branch office.

This move brought the Bureau into close personal contact with operators, but did not materially shorten the time between the gathering of data in the field and their publication in the Report of the State Mineralogist at the end of an annual or biennial period.

Mining activities and development noted by district engineers in their respective fields are now embodied in monthly reports published in each issue of 'Mining in California,' thus making these data available within a maximum period of thirty days, and the Monthly Chapter as far as possible a compendium of current mining progress throughout the State.

The counties included in each field division and the location of the local offices are shown on the accompanying outline map of the State. (Frontispiece.)

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the State's oil fields is included under this heading.

REDDING FIELD DIVISION.

W. B. TUCKER, Mining Engineer.

Shasta County.

COPPER.

Akers Group of Mines, located in Secs. 6 and 7, T. 33 N., R. 5 W., 5 miles west of Kennett, in the Backbone mining district. Elevation 1000 feet. Holdings comprise fourteen claims, totaling approximately 280 acres, located along Squaw Creek, between the Mammoth and Balaklala mines and adjoining the Trinity Copper Company's property on the east. The development work on these claims is confined to five tunnels along an intrusion of quartz-augite-diorite, about 200 to 300 feet in width, with a general east and west trend, which occurs in the Balaklala rhyolite. The gossan croppings are prominent and can be followed for about 1000 feet. The ore occurs in small irregular lenticular ore bodies along irregular fissures, one of which trends north and south, with a dip of 60 degrees east, the other having a N. 40° W. trend. The ore is chiefly pyrite, with more or less chalcopyrite and occasional traces of bornite, and carries \$2 per ton in gold and silver. Developments comprise five tunnels from 100 to 300 feet in length with numerous crosscuts. The present work is confined to No. 3 tunnel, where a series of parallel north and south fractures and a N. 40° W. fracture are being drifted on. Some small lenses of ore have been exposed along these fractures varying in width from 2 inches to 2 feet, and from 10 to 15 feet in length. In this tunnel there is a drift 261 feet north on a north and south fracture, and one to the south 244 feet on a parallel fracture, and in this south drift the main N. 40° W. fissure was cut.

On the claims located on the south side of Squaw Creek there are two tunnels, which have lengths of 100 feet. In the lower tunnel, which is driven on a northwest fracture a small lens of ore 40 feet in length and about 2 feet in width has been developed. Samples taken from this orebody are reported to carry from 2 to 6 per cent copper. One man employed on development work. J. W. Akers of Kennett, owner.

Woodrow Wilson Mine, located in Sec. 4, T. 33 N., R. 2 W., $1\frac{3}{4}$ miles southwest of Ingot, in the North Cow Creek Mining District. Elevation 1800 feet. Owners are the *Triumvate Mining Company* of Ingot, H. M. Swift, president, J. H. Jones, secretary. The holdings consist of the following claims: Homestead Extension, Woodrow Wilson, Woodrow Wilson Extension, Woodrow Wilson No. 2, No. 3 and No. 4, approximately 160 acres, located on the East Copper belt, and adjoining the Afterthought Copper Company's property on the west. Two systems of veins have been developed, known as the Homestead and Woodrow Wilson lodes. The former occurs in a sheer zone in the rhyolite which lies south of the contact of the rhyolite and shales of the Pit formation, and has an easterly and westerly trend with a dip of 75 degrees to the north. Two shafts have been sunk on this vein to depths of 35 feet, developing 6 to 8 feet of quartz, in which occur irregular lenses of ore. The ore is of a different character from that developed in the other mines of this district, in that it carries high values in lead. The quartz contains galena, chalcopyrite, pyrite and sphalerite. Samples taken from the vein are reported to assay, copper 2.5 per cent, lead 17 per cent, zinc 3 per cent, gold and silver \$3 per ton.

The Woodrow Wilson lode lies close to the contact of rhyolite with black and gray shales, and strikes northeast and southwest, with a dip of 50 degrees to the northwest. The ore is similar to that of the Afterthought mine, being composed largely of pyrite, sphalerite, chalcopyrite and galena with local traces of bornite. Samples taken from No. 1 and No. 2 tunnel workings are reported to assay, copper 1 per cent, lead 6 per cent, zinc 13 per cent, gold and silver \$2 per ton. Developments on this lode consist of three tunnels: No. 1 tunnel is driven N. 30° E., 140 feet in the slate hanging wall, then 120 feet east to the contact, where some small lenses of ore were found. No. 2 tunnel is located 180 feet northwest and 70 feet below No. 1 tunnel, and is a crosscut driven 400 feet southwest in the slate to the contact, with a drift to the northeast 200 feet on the contact. The ore developed occurs on the contact in the rhyolite, and is quartz containing small lenses of ore. Owing to the fact that no crosscuts have been driven in the rhyolite in these workings, the possible extent of the orebodies are undetermined. No. 3 tunnel, which is located 650 feet west, and 100 feet below No. 2 tunnel, is a crosscut tunnel driven S. 70° E., 200 feet in the slate hanging wall towards the contact. It will require approximately 300 feet of additional drifting to cut the orebody developed in No. 2 tunnel workings. Only assessment work is being done on the property.

Uncle Sam Mine, one of the noted quartz mines of Shasta County, is located in Secs. 1 and 6, T. 33 N., R. 6 W., 6 miles west of Kennett, in the Backbone Mining District. Elevation 2300 feet. The present owners are *F. H. Dakin Company* of San Francisco, who control 140

acres of patented mineral ground. The property is now under lease and bond to the *American Zinc, Lead and Smelting Company* of St. Louis. Offices of the exploration department of this company are at 55 Congress street, Boston, Mass. The company also have under option the *Colma Copper Group* of claims, which are located in Secs. 3 and 6, T. 33 N., R. 6 W., and adjoin the Uncle Sam group on the north and east. The Colma Copper group of claims lie west and southwest of the Mammoth Mine, and cover the probable direct extensions of the ore bodies developed in the Mammoth Mine, along the so-called 'California fissure' or shear zone, which has a general trend of N. 80° E. The trend of the tabular ore deposition has been developed in the Mammoth Mine from the point of original exposure for a distance of over 4000 feet towards the Colma Copper Group boundaries. Therefore the logical point for further and deeper development of the California fissure would probably be on the Colma Copper territory. Evidently with this idea in view the present company is driving the main crosscut known as No. 5 level of Uncle Sam mine. This crosscut tunnel is driven N. 40° E., and cuts the Uncle Sam vein 1200 feet from the portal, and about 350 feet beyond this vein, cuts a parallel vein of quartz 3 feet in width, which is heavily mineralized with pyrite and chalcopyrite. The crosscut tunnel has been driven ahead 1300 feet, from the point where the Uncle Sam vein was cut, and the company proposes to continue driving ahead to intersect the Mammoth ore fissure.

The formation in which the Uncle Sam veins occur is Balaklala rhyolite which is cut by a dike of andesite porphyry. The greater values were found in the eastern portion of the mine, about this dike.

Two veins are developed in the Uncle Sam mine, which strike northwest and southeast and dip northeast, with a thickness of four feet. A new 10" x 12" Rand Compressor, driven by a 50-h.p. motor has been installed. Electric power is secured from the Pacific Gas and Electric Company. Eight men are employed. C. B. Nichols, superintendent.

Bibliography: State Mineralogist Reports X, p. 639, XI, pp. 47, 395, 398; XII, p. 258, XIII, p. 367, XIV, pp. 802-803.

The *United States Smelting, Refining and Mining Company*, which controls the Mammoth Smelter, Mammoth, Keystone Sutro and Balaklala mines, situated near Kennett, on the West Copper belt is reported to be planning to resume operations in the near future.

GOLD.

Index Group of Mines. Located in Sec. 6, T. 32 N., R. 6 W., one-half mile north of Oak Bottom, in the Stella Mining District. Elevation 1500 feet. Owners, I. F. Rice and A. Kaleel of Whiskeytown. Holdings consist of 12 claims located on a ridge north of Clear Creek.

A series of parallel quartz veins occur in alaskite porphyry intrusions in meta-andesite. The veins have a general east and west trend, with dips north. Widths vary from 2 inches to 6 feet. Developments consist of two tunnels, one 140 feet in length and the other 150 feet, and a number of shallow prospect holes and open cuts. There are three men employed.

Texas Consolidated Mine, located in the Old Diggins district, 9 miles north of Redding, in Sec. 33, T. 33 N., R. 5 W., is under lease to Harvey Sallee of Old Diggins. Several men are employed driving a crosscut on tunnel level No. 5 to pick up the vein, which was faulted on this level.

Siskiyou County.

Fairchild Mine, which is situated at the head of Long Gulch, west of Hawkinsville, has been taken under bond by T. W. Billings and associates of Oregon. It is reported that in recent development work on the property, a rich shoot of ore was encountered. The vein is said to have a width of 8 feet, and to carry high values.

The Rainbow Mine, located $1\frac{1}{2}$ miles northwest of Hawkinsville, is being developed by T. C. Quinn of Oakland. It is reported that after drifting 90 feet, a vein of quartz was developed that carries high values in gold.

PLACER MINING ACTIVITY.

It is reported that there will be increased activity in placer mining this spring near Cecilville, Oak Bar, Forks of the Salmon River, Sawyers' Bar and also on Elk Creek near Happy Camp. Due to abundant rains and heavy snowfall this winter the season's run for hydraulic mining should be somewhat more extended than previous years. Therefore, there should be a large output in placer gold from the county this season.

Trinity County.

Cabode Mine, which is situated in Donnelly Gulch, between Lewiston and Deadwood was recently leased by James Welsh and Charles Paulsen of Lewiston.

In prospecting and development work on the property a small vein of quartz has been developed which carries high values in gold. Samples taken from the ledge, which is from three to six inches wide, assayed from \$5,000 to \$6,000 per ton. About three tons of rich ore are on the dump awaiting shipment. The property has not been worked for many years.

Union Hill Hydraulic Mine, is located in Sec. 6, T. 32 N., R. 9 W., one mile east of Douglas City, between Weaver Creek and Trinity River, and contains 300 acres.

The property is under lease to T. R. Arbuckle of Weaverville, who during the past year repaired the ditch lines and now has two 7-inch giants in operation under a head of 450 feet.

Water for hydraulic purposes is secured from Grass Valley, and the East Fork of Weaver Creeks, through ditches, flumes, pipes and tunnels that are said to be 20 miles in length. Capacity 5000 inches.

The property was last operated by the *Trinity Consolidated Hydraulic Mining Company* in 1913 and 1914. The gravels of the Union Hill mine are uncemented and lie horizontally on one of the recent terraces about 175 feet above the Trinity River. The depth of gravel is from 50 to 150 feet and is composed chiefly of red clay, sandy clay, bluish gray gravel lying on mica schist bedrock. Nearly

all the values are found in the blue gravel at the bottom on the mica schist bedrock. Seven men are employed.

Bibliography: U. S. G. S. Bulls. No. 430, pp. 51-56; No. 470, pp. 16-18; No. 540, pp. 18-19; State Mineralogist's Reports XIII. p. 465; XIV. p. 915.

The Dannenbrink Hydraulic Mine, located about 6 miles north of Junction City, at an elevation of 2000 feet, on Canyon Creek, in Secs. 12, 13 and 24, T. 34 N., R. 11 W., owned by C. Dannenbrink Estate, has recently been acquired by the *Pittsburg-Comstock Mining Company* of Virginia City, Nevada. The depth of gravel is from 30 to 100 feet with 10 feet of soil overburden with slate bedrock. The company is constructing a new ditch said to be 10 miles in length. Twenty to forty men are employed. T. M. Gibson is superintendent.

Bibliography: State Mineralogist's Report XIII, p. 444.

The 7-cubic feet dredge of the *Lewiston Dredging Company*, which is located on the Martin ranch, north of Lewiston on the Trinity River, was placed in operation during the early part of January.

AUBURN FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

New Report on the Mother Lode Region by the State Mining Bureau.

As the only agency maintained by the State of California to aid and encourage the development of the vast but only partly utilized mineral resources of the commonwealth, it is the duty of the State Mining Bureau to give information on every phase of mining to the inquirer. Among other duties, the Bureau is directed by law to "make, facilitate and encourage special studies of the mineral resources and mineral industries of the state." Under this head comes the new report being prepared on the gold quartz mines of the Mother Lode region. This report (for which a great deal of information not hitherto published has been gathered already) is intended to bring up-to-date in one volume as much as can be learned of the geology, production, history and possibilities of the Mother Lode district.

The first step in this work was the preparation of a new list of mine owners, who must be consulted in a great many cases to get maps and other details regarding idle mines. Often the owners know little about their properties, having come into possession of them by inheritance or purchase when no work was going on. In such cases former superintendents and employes must be found, as these men are often the only source of accurate information. Their knowledge of the mines must be saved, as the loss of it is a very serious handicap if the property is ever reopened.

For a new claim map of the region the various available district maps of private engineers and the records of the U. S. Land Office will be combined and brought to a common scale.

The areal geology of much of the region has been shown in the U. S. G. S. folios on a small scale. It is believed that something can be contributed to the geologic record by examining the geology of a number of selected localities along the lode and recording it on a scale large

enough to show details of structure and formations that could not be shown on the above folios. This involves new field work along parts of the lode that have not received much attention in past reports.

Details are being collected regarding the occurrence, size and disposition of ore-shoots and the observed geologic conditions thought responsible for ore formation. The proper interpretation of this information, gained from visits to active mines and from maps and records of those now closed, is of value when applied to unexplored territory on the same lode. The history of the mines will be preserved in easily accessible form instead of being scattered and lost when mines are closed, maps and records are burnt and owners move away or die.

For the proper classification of wall rocks and ores thin sections of specimens will be studied.

Some study will be made of the mines northward from El Dorado County to determine their relation, if any, with the mines to the south, in the commonly accepted Mother Lode section.

SAN FRANCISCO FIELD DIVISION.

C. MCK. LAIZURE, Mining Engineer.

Monterey County.

Monterey Bay Salt Company, Vierra Bros., owners, Moss Landing, California. This property is located at sea level at Moss Landing. The Pajaro Valley Railroad (narrow gauge) connects it with Watsonville. It is also on a steamer landing, as indicated by the name.

Salt is extracted from sea water at this plant by solar evaporation. The salt works comprises four ponds. Two months are required for the water to evaporate to the density at which the salt crystallizes out and settles on the bottom of the ponds. The layer of crystals is from 4 inches to 6 inches in thickness.

After the salt has formed, the ponds are drained and the salt is then broken up with shovels and pumped, with saturated brine as a carrier, to a washing plant. Here it is washed, then crushed and screened, and put on the market without further refining.

The product is sold mostly to fish-curing plants at Monterey and to ice cream plants, dairies, and cattle men. Nine or more men are employed in season.

The salt from the waters of the Pacific at this point shows a high analysis, and is said to be more uniform than that from San Francisco Bay water on account of the river waters flowing into the latter. It contains very little magnesia. An analysis of a moisture-free sample shows:

| | Per cent |
|---|----------|
| Sodium Chloride (Na Cl) | 99.75 |
| Magnesium Chloride (Mg Cl_2) | 0.00 |
| Sodium Sulphate ($\text{Na}_2 \text{SO}_4$) | 0.05 |
| Calcium Sulphate (Ca SO_4) | 0.14 |
| Water insoluble matter | 0.06 |
| Organic matter | nil |
| Total | 100.00 |

LOS ANGELES FIELD DIVISION.

M. A. NEWMAN, Mining Engineer.

Kern County.

Western Silica Company. The silica deposit of this company is located 18 miles east of Lancaster, or 13 miles southeast of Muroc. It consists of a wide vein of bull quartz, which is being mined by glory hole methods. About 20 per cent of wall rock is sorted out in the process of mining. The material shipped runs 98 per cent silica. About two cars a week at present are being shipped to Los Angeles. A portable Chicago Pneumatic Compressor is used in the mining operations.

P. Carney is president and superintendent of the company.

San Bernardino County.

The Rand District. The big Kelly Mine was discovered by Hamp Williams, April, 1919. Nearly four years have now elapsed, and the outstanding feature of this period is the development of one large and profitable mine in the holdings of the California Rand Silver, Inc.

Next to the holdings of the California Rand Silver, Inc., the Coyote, of the Randsburg Silver Mining Company, has given most promise of developing into a mine of real importance.

Following the Coyote, the Rand Silver King, Inc., locally known as the Bisbee Bray, has developed a number of veins of medium grade ore, but nothing of a shipping grade. The present development now taking place in the Silver King, Black Hawk, Grady, Crites, and Silver Basin shafts, will answer as to what the future of the silver zone of the Rand District will be. Due to the fact that a granite wash, which is several hundred feet thick, covers the entire region east of the so-called 'dyke,' near which the apex of the Kelly Mine was found, it means that a company must spend at least \$25,000 to get a 'look in' as to what may lie under it. However, this expenditure is entirely legitimate and justifiable when the possibility of finding such extremely rich ore as found in the Kelly Mine is taken into consideration.

Grady and Sill. After making a fortune out of the Grady lease on the Big Kelly Mine (California Rand Silver, Inc.), Grady and Sill decided to invest part of their profits on deep development work in the camp. At a point approximately 3000 feet southeast of the main shaft of the Kelly, the Grady shaft was sunk. It is now 1095 feet deep. It first passed through 665 feet of granite wash and then encountered the schist formation. At a depth of 815 feet, the first showings of ruby silver were seen. A station was cut at a depth of 975 feet and a crosscut run north 93 feet, where the vein was cut. This was then drifted on west for 150 feet and averaged 2 to 4 feet in ore-bearing material, giving small values in silver. At present a crosscut is being run from the 1085 foot station to cut the vein. Crosscut now is in 100 feet. Owners, Grady and Sill.

Johannesburg Mining and Milling Company. This company, controlling the Silver King and Silver Moon properties, is under lease to what is known as the *Moon King Leasing Company*. Its principal

stockholders are Tacoma people and its Silver King property is considered among the more valuable in the silver belt of the Rand District.

The Silver King Group of this company lies about 1800 feet easterly from the main shaft of the California Rand Silver, Inc. The group consists of the following claims: Silver King 1, 2, 3 and 4, and the Lucky Fraction. Approximately 86 acres.

The Silver King shaft has been sunk near the northwest corner of Silver King claim No. 2. After sinking through 555 feet of a consolidated granite wash or 'Arkose' formation, the shaft entered the so-called schist formation of the region and at a depth of 603 feet the first showings of ruby silver were encountered. From 603 feet to 682 feet, the shaft was in mineralized schist. Car samples of the material as hoisted between the above depths averaged from \$8 to \$34 a ton. Samples taken of the rich streaks gave values of \$100 and better per ton. At the depth of 682 feet the shaft passed through the vein or mineralized schist. It is proposed to crosscut east at a depth of 700 feet in the shaft to cut the vein and then drift both ways to explore the extent of this ore body. The finding of ore in this shaft is one of the most important developments in the district and much new development is anticipated to the east and northeast of the Silver King Group.

The Silver Moon Group lies about 400 feet west of the main shaft of the California Rand Silver, Inc. It consists of the Silver Moon Claim and the Belle Brown Fraction.

Considerable development work has been done on the property, as follows: The shaft has been sunk to a depth of 550 feet. On the 300-foot level a crosscut was run west 140 feet and also to the east 102 feet. A vein 5 to 6 feet wide was cut 35 feet east of the shaft, assaying \$2 to \$3 in gold and one ounce silver per ton. A drift was run on the vein 35 feet north and 25 feet south. Its course was N. 30° E. and dip 45 degrees southeasterly. On the 515-foot level a crosscut was run 347 feet east. At 269 feet a vein was cut and drifted on 35 feet north and south where cut.

President and general manager, Moon King Leasing Company, W. P. Buckley; secretary, Frank Oakley. Office, Tacoma, Washington.

Pittsburg Mount Shasta Mining and Milling Company. (Black Hawk). This company is sinking a new vertical shaft about 150 feet south of the south line of the Rand Silver King, Inc. The shaft is now down 578 feet. It was sunk through 140 feet of consolidated wash and then entered the silver bearing schist formation. Inasmuch as the Rand Silver King, Inc., has a number of veins, which will in all probability enter the claims of this company, the sinking of this shaft gives much promise of favorable developments. It is planned to crosscut the formation when the shaft attains a depth of 700 feet.

J. O. Greenan is superintendent of the property.

Rand Consolidated Silver Mining Company. This company has started sinking a 1000 foot shaft on the Big Four claim. It is located about 2000 feet northeast of the Silver King shaft, and is in direct line of the

zone of mineralization as extended from the most recent developments in the workings of the California Rand Silver, Inc.

The company is financed by strong Bakersfield interests and the work will be prosecuted with all possible speed.

A. J. Crites of Bakersfield is president of the company.

Silver Basin Mining Company. This company, whose claims lie about 3000 feet south of the new shaft of the Pittsburg Mount Shasta Mining and Milling Company (Black Hawk), controls the following claims: Golden Era, Hidden Treasure, Ransome, Mandan Fraction, O'Farrell Fraction and Y. W. Fraction. In all, 60 acres.

A vertical shaft $4\frac{1}{2}$ feet by $7\frac{1}{2}$ feet is now being sunk to a depth of 600 feet. If this development proves successful in opening up new silver veins in the schist formation it will mean much for the future of the camp, as this development will be nearly one mile south of the main shaft of the California Rand Silver, Inc., and will do much to prove out the silver area of this region.

K. S. Snowlton, president. Office, Redlick Building, Bakersfield, Cal.

San Bernardino County.

Alvord Mine. This well known old gold property, situated out from Yermo, is soon to be reopened, according to information received from the owner, Mr. McCormick of Yermo.

L. S. Emerson is developing a gold prospect in the Dry Lake Mining District, situated 60 miles east of Victorville. A drift is being run in on a vein two to four feet wide, which is said to assay \$32 gold, per ton. Drift now in about 50 feet.

The old *Fortuna Mine* in this same section is also to be reopened by Mr. Emerson.

Myrick. A prospect of much promise has been opened up by 'Shady' Myrick of Johannesburg. It is situated 45 miles east of Johannesburg.

The formation here consists of steeply-dipping quartzites, altered limestones and shales. Several rhyolite dykes have also been intruded between the bedding planes of the above. The general strike of the formation is north and south. Cutting across this formation in a northwesterly and southeasterly direction is a gold-bearing vein which at several points has been exposed by open cuts. Pannings taken of this vein show values of \$30 and better.

At the time the property was visited insufficient work had been done to accurately determine either the width or strike of the ore. The surface showings, however, well warrant the expenditure of money to more fully open up the ore.

It is reported the property is now under bond for \$150,000 and that an initial payment has been made.

'Shady' Myrick has prospected the desert for many years and has to his credit the discovery of a semi-precious stone which has been called Myrickite after him.

The property consists of the following claims: Black Gold Nos. 1, 2, 3, 4, and 5, Lime, Red Rock and Palmyra, approximately 140 acres in all.

F. M. Myrick, Johannesburg, owner.

Pacific Marble Quarries Company. This old Baxter quarry situated at Baxter, 197 miles east of Los Angeles on the Union Pacific Railroad, is being reopened for large scale operation by the above company. A railroad spur has been put in by the Union Pacific, and the management reports that a daily production of 250 to 300 tons will soon be maintained. This limestone is to be shipped to sugar plants and smelters. Lime is also to be made for building purposes.

About 20 men employed at present.

Company has offices at 341 Citizens National Bank Building, Los Angeles.

President, R. B. Knox; secretary and treasurer, J. M. Finlayson; general manager, W. A. Griffing; superintendent, M. J. Johnson.

Smith Minc. This gold property is one and one-half miles west of Baxter and one-half mile north of the Union Pacific Railroad. It consists of the three claims—Ben, Ben Extension, and Trojan. The veins occur in a diorite dyke near a rhyolite contact and the outcrop is very noticeable, due to oxidation.

Vein courses northeast and southwest and is nearly vertical. Development consists of a 50-foot shaft on the Ben claim.

Several thousand dollars of high grade ore was shipped out of this shaft.

At present a crosscut tunnel is being run to cut this vein at a greater depth at a point under the bottom of the shaft.

Ed Smith, owner. Address, Baxter, Cal.

OIL FIELD DEVELOPMENT OPERATIONS.

R. E. COLLOM, State Oil and Gas Supervisor.

From January 13, 1923, to and including February 10, 1923, the following new wells were reported as ready to drill:

| Company | Sec. | Twp. | Range | Well No. | Field |

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff containing much information that will add to the permanent value of the Monthly Chapter are included in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

MINING LOCATION ON STOCK-RAISING LANDS.

(Numerous inquiries have been received by the State Mining Bureau regarding the rights of a mining claim locator on land taken up under the Act of Congress, entitled "An act to provide for stock-raising homesteads, and for other purposes," commonly called the 640-acre homestead act; where such holdings conflict with mining claims or include mineral-bearing land.

At the request of the State Mineralogist, the following statement setting forth the rights of a mining locator on such lands was prepared by the United States Bureau of Mines, and may be taken as official.)

RIGHTS OF LOCATOR.

"The rights of a locator of a mining claim on grazing or stock-raising lands, is governed by section 9 of the Act of Congress, approved December 29, 1916, entitled 'An act to provide for stock-raising homesteads, and for other purposes.' (39 U. S. Stats., 862.)

"The entries and patents issued under the act must contain a reservation to the United States of all coal and other minerals in any such lands, 'together with the right to prospect for, mine, and remove the same.' Any coal or other mineral deposits in any such lands are subject to disposal by the United States, according to the coal and mineral land laws in force at the time of any such disposal. All qualified persons are expressly given the right at all times to go upon any such lands entered or patented, for the purpose of prospecting for coal or other mineral therein. Any such prospector, however, is not to injure, damage or destroy any permanent improvements of any such entryman or patentee, and he is required to compensate the entryman or patentee for any damage on such lands.

"A prospector who has thus discovered coal or minerals in or upon any lands that have been entered or patented as grazing or stock-raising lands under the provisions of the act, may, upon acquiring from the United States, the coal or other mineral deposits in such lands, and the right to mine and remove the same, then re-enter and occupy so much of the surface of such land as may be reasonably incident to the mining

and removal of the coal or other minerals, but upon the following conditions:

"1. Before re-entering for mining and removing the minerals, he must secure the written consent or waiver of the homestead entryman or patentee, and

"2. He must pay damages to crops or tangible improvements if and when an agreement is reached as to the amount of such damages.

"In lieu of either of the provisions numbered 1 or 2, he may execute a bond or undertaking to the United States for the use and benefit of the entryman, patentee or owner of the land, to secure the payment of all damages to crops or tangible improvements of the entryman or owner, as such damages may be determined and fixed in an action brought upon the bond or undertaking in any proper court. The bond or undertaking must be in form and in accordance with rules and regulations prescribed by the Secretary of the Interior and is to be approved by and filed with the register and receiver of the land office in the district wherein the land is situated.

"Any patents issued for coal or other mineral deposits under the provisions of the act, must contain notations declaring them to be subject to the provisions of the act with reference to the disposition, occupancy and use of the land as permitted to an entryman or patentee.

"Under the first section of the act no land can be entered as a stock-raising homestead until the lands shall have been designated by the Secretary of the Interior 'as stock-raising lands.' After the lands have been so designated by the secretary, then qualified persons may enter and hold the same for the purposes contemplated by the act and may hold and possess the same for such purposes as against all persons except mining prospectors and those who have acquired the right to mine and remove minerals discovered, as provided in section 9.

"An entryman, patentee or owner of any such lands may, without doubt, make a valid mining location upon the lands, the same as any other person, but in making his mining location, he must comply with the law in manner and form as if he were a stranger.

"The entryman, patentee or owner of lands acquired under this act for grazing or stock-raising purposes, has no preference right whatever to locate a mining claim upon the land. In this respect he is on an equality with all other persons and can take no advantage whatever of the fact that he is the owner or in the possession of the land.

"The rights of all persons making mining locations upon any such land used for grazing or stock-raising purposes, must be measured and determined by the rules of priority that govern in relation to the location of mining claims upon public lands generally.

"Such grazing or stock-raising lands, held under the act, are, for the purposes of making mining locations, in effect, public lands.

"The fact that the notice of a mining location was posted in the night time could not affect its validity, if the locator otherwise complied with the law.

"The owner or occupant of any such grazing or stock-raising lands who defaces or destroys a notice posted upon such lands of a mining location, is subject to the same penalty and punishment as a person who destroys any notice of a mining location."

LIMESTONE DEPOSITS OF McCLOUD RIVER, SHASTA COUNTY, AND THEIR POSSIBLE VALUE FOR CEMENT MATERIAL.

By W. B. TUCKER, Mining Engineer.

Description of the McCloud Limestone.

In the Redding Folio of the United States Geological Survey this belt of limestone is described as follows: The limestone can be traced more or less continuously for twenty-five miles from the north end of the Sacramento Valley, near Lilienthal, northward to Nawtawakit Mountain, where it passes beyond the quadrangle boundary. Near Lilienthal it begins with a series of small limestone lenses, apparently included in Dekkas andesite and worn down to the level of the valley plain. Although much metamorphosed and in some places wholly crystalline, they contain distinct traces of fossils definitely fixing their

View of McCloud Limestone Exposure, Section 13, Township 34 North, Range 4 West, Shasta County.

age. Farther north they rise above the plain and form hills increasing in prominence to Gray Rocks. For ten miles beyond Pit River the escarpment of the McCloud limestone forms one of the principal topographic features, but it is very much cut up by quartz-augite-diorite into irregular patches of limestone separated from one another by distances varying from a few feet to over two miles. How much of this irregularity may be due to the original lenticular character of the limestone is not known, but there can be no doubt that it is mostly due to the dissecting igneous rock. The largest mass is that opposite the United States Fishery, in Sec. 13, T. 34 N., R. 4 W. Two other large masses occur in the Hirz Mountain region, but farther north, in the western portion of Nawtawakit Mountain, there is a considerable decrease in size.

The largest and most accessible exposures of the McCloud limestone are at Gray Rocks, near Bayha, the old Bass's ranch locality and farther north on the McCloud River opposite the United States Fishery. The two localities are separated by quartz-augite-diorite, which cuts the limestone.

Topography.

The McCloud limestone generally resists weathering more effectively than the associated quartz-augite-diorite, so that it usually gives rise to bold outcrops and, where large, becomes one of the principal factors in the topography, forming prominent ridges and peaks.

Thickness.

In thickness the McCloud limestone varies from 200 feet or less near the south end, where it appears in small lenses, to approximately 2000 feet in the prominent rugged mountain formed by it a short distance northeast of the United States Fishery.

Relation to Adjacent Formations.

Throughout the greater part of its extent in the Redding quadrangle the McCloud limestone is bounded both east and west by quartz-augite-diorite, but for over two miles south of the Black Diamond mine it lies conformably between the Baird and the Nosoni formation.

Lithologic Character.

The limestone is dark gray and massive below, and lighter colored and somewhat thinner-bedded above, with many nodules and sheets of gray chert, often containing silicified fossils.

Analysis of a sample of limestone from the deposit opposite the United States Fishery, submitted by Mr. E. W. D. Johnson, made by Smith, Emery and Company of San Francisco, is as follows:

| | Per cent |
|---|----------|
| Silica (SiO_2) | 1.10 |
| Alumina (Al_2O_3) | .24 |
| Iron oxide (Fe_2O_3) | .20 |
| Lime (CaO) | 52.16 |
| Magnesia (MgO) | 2.38 |
| Loss in ignition | 43.96 |
| Total | 100.04 |
| Purity as carbonate of lime (CaCO_3) | 93.2 |

Possibilities of the Use of the McCloud Limestone for Cement Material.

The largest and most accessible exposures of the McCloud limestone are in Sections 12, 13, 14, 23, and 24, T. 34 N., R. 4 W., M. D. B. and M. In these sections there is an inexhaustible supply of limestone which, due to its low magnesia content, is satisfactory for the manufacture of cement. The prominent rugged mountain, northeast of the United States Fishery, has an elevation of 3114 feet above sea level. The limestone here allows an elevation above the base exposed on the mountain

of over 1600 feet. Where exposed by erosion of a canyon to a depth of 1600 feet on the south end of Sec. 13, the deposit shows a thickness of fully 2000 feet.

Transportation.

These deposits are $2\frac{1}{2}$ miles north of the Sacramento and Eastern Railroad, which crosses the McCloud River at its mouth and continues up the Pit River to the Bully Hill smelter of the Shasta Zinc and Copper Company, at Winthrop, a distance of 17 miles. This railroad connects with the main line of the Southern Pacific four miles below the mouth of the McCloud River. The distance from San Francisco on the main line of the Southern Pacific is 253 miles, to Pit Station, the terminus of the Sacramento and Eastern Railway.

Power.

Hydro-electric power is available from the lines of the Northern California Power Company. The nearest substation is located at Heroult, about three miles south of the property. The published rate for extensive industrial use is about three-fourths of a cent per kilowatt hour.

Shale.

One mile and a half distant from the United States Fishery are large deposits of shale, located on the opposite side of the McCloud River, in section 16, T. 34 N., R. 4 W., about 400 feet above the elevation of the river.

This deposit has been estimated by M. E. Dittmar, to contain approximately 200,000,000 tons of shale, as a cross-section of the erosion shows a thickness of over 300 feet, and average width of half a mile. The state highway crosses the northernly end of the shale deposits.

Analysis of sample from this shale deposit submitted to Smith, Emery and Company of San Francisco, is as follows:

| | Per cent |
|---|----------|
| Silica (SiO_2) | 57.51 |
| Alumina (Al_2O_3) | 19.85 |
| Titanium oxide (Fe_2O_3) | .81 |
| Iron oxide (Fe_2O_3) | 8.28 |
| Manganese oxide (Mn_2O_3) | 1.34 |
| Lime (CaO) | 2.98 |
| Magnesia (MgO) | 2.61 |
| Loss in ignition | 4.46 |
| Alkalies (by diff.) | 3.16 |
| Total | 100.00 |

Conclusions.

These deposits of limestone and shale will furnish an inexhaustible supply of raw material for the manufacture of cement and are situated only a short distance from railroad transportation.

THE PROBLEM OF EXPLOITING THE SMALL MINE AND PROSPECT.

By C. A. LOGAN, Mining Engineer.

A general survey of the district extending from Plumas County on the north through Mariposa County on the south and including the principal mining counties of east-central California, shows that about two-score gold-quartz mines have had individual production records of from a million to several millions of dollars each. Considering the relatively limited scale of operations and the shallow depths reached in most cases, their histories indicate great possibilities for many of those small mines and prospects that now lie idle in the district. Why are so many of these idle? What has been the tendency in recent years of those operators who have been able to command adequate money for mining? Everyone is familiar with the effect of high prices of labor and materials, the resulting high costs of mining, and the business conditions that have attracted money to other fields. At the same time, prosperous companies have been spending a good deal of money in their own way in mine development in California. But while demanding from mining a high prospective yield, they have tried to sidestep as many as possible of the inherent risks of the business. In line with this policy they have set up hard and fast conditions that can not be met by the average small owner and prospector. The following expression by the superintendent of one of these large companies is typical of the attitude taken by many of them:

"Since the owner of the claims mentioned has no records of the past production it would be impossible to interest the company, as they would want to see an assay plan, or mint returns of the gold produced."

The property referred to is a prospect located on one of the strongest vein systems in the state, lying between former good producers, and typical of a great number in the California gold belt. They are really grass-root prospects. Many of them have produced some rich ore at and near the surface, else no attention would ever have been given them. This ore may have been the rich pocket rock characteristic of the surface zones of most of the mines later proven in depth, or it may have been from the stumps of ore shoots mostly removed by erosion. But there has been no accurate and detailed written record kept of the results as work was being done. The prospector is not as a rule a man of literary bent; he writes reluctantly and with difficulty. He relies on human contact. If mining companies will not establish contact with him by sending sympathetic, even if sophisticated, scouts out into the field to meet him and if necessary call his bluff by examining and sampling his claims, the record of his work will be lost with him. With the recent successful development of many California mines at depths of 4000 feet and more, and the light that has been thrown on geology by this deep work, the fissure veins have been proven to be a deep-seated type. There is ample precedent in the success of many companies to justify unproductive sinking for 500 to 1000 feet between ore shoots and by the same token it appears reasonable to prospect undeveloped properties where observable conditions are right. It is not reasonable to think that all ore shoots must outcrop, and as a matter of fact such mines as the Argonaut, South Eureka, Tightner

and others were covered by lava and gravel caps. They would not have been opened had it not been for the information gained in adjacent mines by men of initiative, or as in the case of the Tightner, where the old miners' tales came to the ear of a man who could listen sympathetically and act on what he heard.

The larger companies have lately been doing little real field work or prospecting for new mines in California. A few prospects that have been brought to their attention have been superficially examined, but little money has been spent by them in untried properties. They have devoted their attention chiefly to old mines with notable past production records, as will be borne out by a short summary of the principal activities they have engaged in, at least as concerns operations carried on avowedly for company account. None of the old established companies are known to have brought in a single new notable producing quartz mine in this state, nor to have done any important work in any new or hitherto unimportant district in northern California, for a number of years. Following is a list of the principal properties that have received attention from them:

Plumas County. Philadelphia Exploration Company equipped and unwatered the old Crescent and Green Mountain Mines at Crescent Mills. After extended and expensive exploratory work below the old levels, they quit without milling any ore. No well financed company has done any work lately in the county in gold mining.

Sierra County. Work by the better financed companies has been centered around the mines of the Alleghany district. The Tightner has been put into production again. The records of the Plumbago, Tightner, and 16 to 1 have attracted notice and North Star Mines Company, Tonopah Mining Company and Alleghany Mining Company are engaged in reopening old mines with good past records.

Nevada County. No large company has undertaken the exploration of new property. The Harry Payne Whitney interests have been spending large sums in rehabilitating the Idaho-Maryland group.

Placer and El Dorado Counties. No well financed company has attempted any work of late in these counties, except for one small venture by Metals Exploration Company in eastern Placer. Work started on old properties at Nashville just before the war, was stopped when war was declared, as the capital for this work was coming from England.

Amador County. At present the scene of the principal development of the Mother Lode. The Old Eureka, Plymouth Consolidated and Freemont Mines, all well known past producers, have been reopened.

From the Moore Mine to Carson Hill there has been no recent important development except by a few inadequately financed companies. At Carson Hill and Melones the reopening and further successful exploitation of the Morgan Mine and Melones Mine by Carson Hill Gold Mines, Inc., has kept Calaveras County among the important bullion producers. North Star Mines Company prospected two old properties at West Point in 1921-22 without any production.

Tuolumne County. In contrast to the usual policy of the prosperous companies, Nevada Wonder Mining Company and Tonopah Mining Company have been doing some real prospecting in claims on Jackass Hill and in the Crystalline and Alabama Mines in this county.

If the larger and well financed companies will not hunt for new mines, who will? The field under consideration offers very attractive inducements to stock companies that are honestly conceived and managed and properly financed. A glance at the recent operations of the small, new promotions lately active in the state will indicate that they have not been as successful in contributing to the welfare of the industry as might be desired. Many of them have been based on old mines, and possibly for the same reasons that have actuated the larger companies in devoting so much of their money to this class of property. Astute promoters and engineers admit that it is easier to get money for rehabilitating and further exploring an old mine with a bullion record than it is to interest capital in a new venture. The following are some of the mines recently the subjects of promotion by companies that have put their stock out for sale in small parcels to many buyers, and the present state of these ventures:

Allison Ranch Mine. An expensive mill built before the mine had been adequately explored. Operation suspended after unsuccessful prospecting.

Rising Sun Mine. An expensive mill built before the mine had been unwatered or explored. Operation suspended after a little prospecting, as the funds had been exhausted to pay for surface improvements. No sinking was accomplished.

Patterson Mine. A very complete and quite expensive mill and surface plant were erected prematurely, and before the vein exposed had been properly sampled. Operation was suspended after crushing a few tons of ore which was found to be of unexpectedly low grade, and after an acute shortage of funds developed that had been hastened by heavy expenses on top.

These ventures were all based on old mines with good past records. In each case, too much credence was placed in the belief that good ore was waiting in the bottom to be milled, and the promoters were in such a hurry to begin production that mills were erected before the stories were fully investigated. In many such cases the stockholders themselves are to blame for demanding too early a return on their money, and in many others the trouble is due to insufficient financing, and the idea that the mine must be put into production at the earliest possible time, to pay its way, regardless of whether or not it has been developed to the point where it can sustain the needed output. The mournful monuments of wood and iron standing over so many idle mines, of which the above are merely cited as up-to-date samples, represent many a time enough money to have found good ore, if spent underground. It is poor business in every way to put up a mill before it is needed. While a mine is still unproven, its stock is naturally cheap and hard to sell. Therefore every available dollar should go toward proving ore. If ore is found, the stock at once increases in value and becomes easier to sell. It is never hard to finance mill

building if people can be shown enough ore to justify it, and the mill is not needed in any event until ore is proven, and represents so much capital tied up and unproductive until it can be put in operation. It is safe to say that lack of capital, lack of honesty and poor business judgment are responsible for at least half of the failures of such mining projects to come to a productive stage; few of them ever get sufficient development to show what they can do. The Allison Ranch Mine has been one of the few exceptions, and can be said to have been quite well explored by the last operators. The numerous promotions that have come and gone without contributing to the welfare of anyone except the stock salesman, is in sharp contrast to the few successful operations that have resulted when good business judgment, mining experience and good faith with the buying public have been combined, in charge of the promotion. But most of these have been based on old mines, and it is hard to recall in recent years any important examples of good mines developed from new prospects to important producers in this section of the state, as far as gold quartz mines are concerned. The Morgan Mine on Carson Hill had a record of about \$3,000,000 previously to its credit, but had lain idle 20 years when taken over by Wm. J. Loring. No consideration of the mines promotion problem would be complete without citing this successful example of what can be done with California mines if adequately financed and honestly and intelligently developed. There may not be another Morgan Mine in California; it is true that in the early days it produced the largest single piece of pocket gold ever found, worth about \$300,000. But there are many mines waiting for development that are well worthy of attention. If the stock buying public could be brought to the point of informing itself a little more fully of the merits of a mine promotion before parting with its money, there would be more dividends and more mine development. If the multitude of mine promotions based on California mines but incorporated in other states, were domestic corporations controlled by a fairly administered law, it would be a help to mining and to the stockholders, but the state law cannot reach beyond the border to prevent misrepresentation of some mines and consequent injury to the whole industry.

Another form of mine exploitation growing out of the desire of the promoter to escape the blue sky law, is the unit plan, which has been tried in a small way during the past year or two. The following are the main points in one of these projects submitted to the public last summer:

Mr. X secured an option to purchase certain claims, and concluded that \$25,000 was needed to finance their operation. He thereupon divided the option into 100 interests, or "units," to be sold at \$250 each.

On payment of \$250 each subscriber was held to be entitled to 1/100 interest (or more, at the same rate) in the option, and in case the option were closed, to a like interest in the property and any production from it.

The price of \$7,500 for the property to be paid as follows: \$1,000 cash on the subscription and sale of 20 units; \$1,500 cash on the subscription and sale of 30 units more; the balance to be paid with 30 units at par, at which time a deed would be given for the property.

No meeting of unit holders, and no provision in any way for their protection, or for safeguarding the funds or directing the spending of same, was provided for until the above 50 units had been sold. The main objection to this plan is that it places too great a responsibility and moral strain upon one man, and there is too much danger of the plan falling through before the unit holders even organize.

On the owner's side, we find in later years that there is an increasing number of absent owners, living in town or perhaps hundreds or thousands of miles away. When a man ceases to be a miner or prospector and leaves his claims because of choice or necessity, the prospective buyer has much less chance to become interested in them. This condition is partly due to the collapse of former mining booms, during which mines and prospects were eagerly bought by non-residents, and partly to the growth of urban life, the removal of successful former mine operators to the cities where they have invested the fortunes gained in mining, in other business, and their children have grown up strangers to the mines.

Summarizing, then, we see that on the one hand we have a number of well financed companies that are interested in finding new mines. They realize that the properties on which their prosperity is based are wasting, and will last only a few years longer in many instances. They have good organizations and wish to continue mining. But they will not as a rule do much prospecting. They want something already brought to the point where there is evidence of a good sized mine in the making. This means at least a few hundred feet of development, with an exposure of ore sufficient to give hope of a good sized ore shoot, and with an assay record properly kept, and that will stand up under re-sampling.

On the other hand are the numerous non-resident owners of mines who are not miners, or for some reason are unable to put their properties in operation.

The situation would seem to call therefore for a class of middlemen to take hold of good prospects and bring them to the point where they are proven valuable or worthless. Properly handled stock companies, organized to develop mines, and with proper technical guidance, can render real service in this direction. The more good prospects that such a company can investigate, the better will be the chance of profit. If one out of four of these prospects makes a mine, the profits from the one property ought easily to care for all expense on the others and give a good net yield besides.

SECRETARY'S OFFICE.

W. W. THAYER, Secretary.

The California State Mining Bureau was created April 16, 1880, by legislative act. In March, 1893, the original act was repealed and an amended act approved and passed by the legislative body. Again on June 16, 1913, a new Mining Bureau Act was approved which became effective August 10, 1913, repealing all former acts, and forming the basic law under which the Bureau now functions.

It is doubtless true that both the mining and lay public have not in the past always recognized the part played by the Bureau in the development of the state's mineral resources. Innumerable inquiries regarding them, originating within and without its borders and in foreign countries, have been answered with ultimate results reflected by a consistent growth in the value of the state's mineral output since the records of production were first compiled by the Bureau in 1887.

It is believed that a better understanding of the economic position occupied by the Bureau will be imparted to the public, whose funds support it, by embodying in the Monthly Chapter a review of the executive activities.

The responsibility for the coordination of effort of each department, to the end that the utmost efficiency may be maintained with the limited and variable appropriations accorded the Bureau by successive legislatures, rests upon the office of Secretary.

Activities referable to that office, such as reports of new maps and publications issued, amount of mail handled, changes and enlargements in offices, changes in personnel of the staff, property and equipment, financial statements, etc., are therefore included herein.

New Publications.

During the month the following Bureau publications have been made available for distribution:

Summary of Operations, California Oil Fields, November, 1922, Vol. 8, No. 5.

Mining in California, November, 1922, (Monthly), Vol. 18, No. 11.

Distribution of Publications.

The Bureau's publications are constantly in demand, requests for copies coming from all over the United States and foreign countries.

Publications were distributed during the month as follows:

| Publications | Number Distributed |
|---|-----------------------|
| Report XIV State Mineralogist..... | 3 |
| Report XV State Mineralogist..... | 3 |
| Report XVII State Mineralogist..... | 6 |
| Mines and Mineral Resources of Colusa, etc. | 2 |
| Mines and Mineral Resources of Del Norte, etc. | 2 |
| Mines and Mineral Resources of Fresno, etc. | 2 |
| Mines and Mineral Resources of Imperial, etc. | 6 |
| Mines and Mineral Resources of Alpine, etc. | 5 |
| Mines and Mineral Resources of Butte, etc. | 3 |
| Mines and Mineral Resources of El Dorado, etc. | 5 |

| | |
|--|------|
| Mines and Mineral Resources of Los Angeles, etc. | 5 |
| Mines and Mineral Resources of Monterey, etc. | 3 |
| Mines and Mineral Resources of San Bernardino, etc. | 1 |
| Mines and Mineral Resources of Nevada County | 8 |
| Mines and Mineral Resources of Plumas County | 3 |
| Mines and Mineral Resources of Sierra County | 4 |
| Bulletin No. 6, California Gold Mill Practices | 1 |
| Bulletin No. 37, Gems, Jewelers Materials, Ornamental Stones of California. | 6 |
| Bulletin No. 50, Copper Resources of California (revised) | 1 |
| Bulletin No. 72, Geologic Formations of California | 5 |
| Bulletin No. 75, United States and California Mining Laws | 9 |
| Bulletin No. 76, Manganese and Chromium in California | 1 |
| Bulletin No. 78, Quicksilver Resources of California | 5 |
| Bulletin No. 85, Platinum Resources of California | 61 |
| Bulletin No. 89, Petroleum Resources of California with special reference to unproved areas | 58 |
| Bulletin No. 90, California Mineral Production for 1920, with County Maps. | 23 |
| Mining in California (Monthly) Vol. 18 No. 10, October, 1922. | 75 |
| Summary of Operations, California Oil Fields (Monthly) Vol. 8, No. 4, October, 1922. | 2875 |
| County Maps and Registers of Mines | 5 |
| Copper Deposit Map | 4 |
| Inyo County Geological Map | 1 |
| Minaret Map | 1 |
| Tuolumne County Mineral Map | 1 |
| Geological Map of California, mounted | 14 |
| Lake County Map | 1 |
| Oil Field Maps | 425 |
| Map accompanying Bulletin 89 | 62 |

Mails and Files.

The Bureau maintains in addition to its correspondence file a mine report file, which includes reports on some 7500 mines and mineral properties in California. Also, there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the month 938 letters were received and answered. They are practically all requests for information and the inquiries cover all phases of prospecting, mining and developing mineral deposits, reduction of crude minerals and marketing of refined products.

Drafting Room.

The Bureau maintains an up-to-date drafting department, where topographic and geological maps, tracings, oil well logs, and oil field maps are prepared.

DIVISION OF MINERALS AND STATISTICS.

Statistics, Museum, Laboratory.

WALTER W. BRADLEY, Statistician and Curator.

STATISTICS.

California produces commercially at least fifty different mineral substances, with a total annual value averaging in recent years in excess of \$250,000,000. There are several thousand operating properties, including mines, quarries, oil and gas wells, mineral springs, gravel pits, mills, and smelters. The task of compiling accurate and dependable statistics covering their activities is a difficult one, requiring care and a technical knowledge of properties and processes.

Since the inauguration of the Monthly Chapter, it is possible to publish the production figures for any mineral within a maximum period of thirty days from the date on which returns are complete. It is hoped that the early appearance of the figures for some of the minerals will induce other operators to cooperate, to the end that the complete statistical bulletin may be incorporated in one of the early mid-year issues of the Chapter. Blank forms were sent out in January, and the 1922 data are now coming to hand, so that we hope to be in a position to give some of the figures in the March issue.

MUSEUM.

The Museum of the State Mining Bureau possesses an exceptionally fine collection of rocks and minerals of both economic and academic value. It ranks among the first five of such collections located in North America, and contains not only one or more samples of most of the known minerals found in California, but many specimens from other states and foreign countries as well.

Mineral specimens suitable for exhibit purposes are solicited, and their donation will be appreciated by the State Mining Bureau as well as by those who utilize the facilities of the collection. The Bureau supplies a set of forty typical minerals and ores, appropriately labeled, for study purposes to any public school in the state upon request. During the past 30 days, a total of 475 visitors signed their names to the Museum register, and in addition there are many others daily who fail to take note of our request for their signatures.

LABORATORY.

FRANK SANBORN, Petrologist.

A sample of allanite, a complex silicate containing some of the rare earth metals, was one of the 216 samples received during the thirty-day period covered by this report. This is the second sample of allanite from a California locality received at this laboratory during the past year.

A list of the samples having a possible commercial value, judged from the sample submitted only, is appended:

- 15-15 Phosphate of lime; also turquoise.
- 15-16 Psilomelane (manganese ore).
- 15-17 Gypsum.

- 15-18 Red Rock; suitable for stucco "dash."
- 15-19 Limestone; also volcanic ash.
- 15-20 Aresnopyrite.
- 15-21 Barite.
- 15-22 Silver-cobalt ore, nickel and copper present.
- 15-23 Garnet.
- 15-24 Altered material; contains silica, lime, phosphate, and fluoride.
- 15-25 Gold-copper ore.
- 15-26 Clay.
- 15-27 Silver ore; contains some gold.
- 15-28 Silver ore; also marble.
- 15-29 Gypsum.
- 15-30 Silver ore; very high grade.
- 15-31 Malachite (copper carbonate).

LIBRARY.

E. COONEY, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received during the month, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the State are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

OFFICIAL PUBLICATIONS RECEIVED.

Governmental.

U. S. Geol. Survey:

Bulletin 725—Contributions to Economic Geology, 1921. Part I, Metals and Nonmetals Except Fuels. By F. L. Ransome and E. F. Burchard, Geologists in Charge.

Bulletin 726—Contributions to Economic Geology, 1921. Part II, Mineral Fuels. By David White and M. R. Campbell, Geologists in Charge.

Bulletin 727—Potash in the Greensands of New Jersey. By George Rogers Mansfield.

Bulletin 739-B—Mineral Deposits of the Wrangell District, Southeastern Alaska. By A. F. Buddington.

Bulletin 739-C—Recent Investigations of Petroleum in Alaska (Cold Bay, Iniskin Bay, Anchorage, Nenana Coal Field). Papers by S. R. Capps, F. H. Moffit, A. H. Brooks and G. C. Martin.

Gold and Silver in 1921. By J. P. Dunlop.

Stone in 1921. By G. F. Loughlin and A. T. Coons.

Natural-Gas, Gasoline in 1921. By E. G. Sievers.

Western Sentinel, Etna Mills, Cal.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of consumers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them, have been made known to those looking for raw mineral products.

Sufficient publicity has not heretofore been given to this feature of the Bureau's work, but in 'Mining in California,' a suitable medium is provided for current inquiries of this nature, and, therefore, written or verbal inquiries that come to the attention of the Bureau are summarized in each issue.

The name of the product wanted or offered, only, is published; the name of the owner of the deposit, or buyer, and other details being supplied upon request.

In writing, the reference number of the item should be given.

Mineral Products or Deposits for Sale.

- 12-14 Limestone: eighty acres in Santa Clara County, ten miles from railroad.
- 12-15 High-grade limestone and marble deposit in Siskiyou County, four miles from Southern Pacific Railroad.
- 12-16 Feldspar: Tulare County.
- 12-17 Feldspar deposit: very large; in Kern County, $2\frac{1}{2}$ miles from Southern Pacific Railroad.
- 12-18 Limestone deposits in Orange, Kern, San Bernardino, and Siskiyou counties.
- 12-19 Scheelite.
- 12-20 Flourspar; tonnage.
- 12-21 Diatomaceous earth in Monterey County, $4\frac{1}{2}$ miles from railroad.
- 12-22 Montmorillonite or "rock soap".
- 12-23 Sericite-schist (talcose).

Mineral Products or Deposits Wanted.

- 13-14 Lump pumice; 1-in. to $1\frac{1}{2}$ -in. lumps and up.
- 13-15 Radio pyrite.
- 13-16 Arsenopyrite ore.
- 13-17 Witherite (barium carbonate).
- 13-18 Workable quality of slate; deposit.
- 13-19 High colloidal clay.
- 13-20 Colemanite; tonnage or deposit.
- 13-21 All minerals excepting gold and silver; especially non-metallics.
- 13-22 Magnesite; high-grade; tonnage or deposit.

EMPLOYMENT SERVICE.

Following the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau registers technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of applicants for positions and 'positions open,' received by the Bureau during each 30-day period preceding the date of publication of the Monthly Chapter is carried in each issue.

Each notice is designated by a key number, and communications sent to the Bureau in reply to any notice will be forwarded to the proper party without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss.

Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 11-5 Electrical or mechanical engineer. Five and one-half years' experience as draftsman, assistant engineer, and engineer in Boston, Seattle, and San Francisco. One and one-half years in the air service, U. S. Army. Age 29. Married. References. Salary wanted, \$225.
- 11-6 Civil or mining engineer. Fifteen years' engineering experience in coal mining, oil fields, railroad and building construction. Age 36; single. Salary open.
- 11-7 Mining engineer or assistant. Four and one-half years' experience mining and geology in Alaska and Idaho and as metallurgist at electric smelter, Tacoma. Age 28; single. References. Salary open.

PUBLICATIONS OF THE CALIFORNIA STATE MINING BUREAU.

During the past forty-two years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield; Auburn, and Redding. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

REPORTS.

Asterisks (**) indicate the publication is out of print.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the State may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the State. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive forward step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922.

A monthly publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff are included. Mineral production reports formerly issued as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance are reported monthly. The assistance formerly given to producers and consumers by consultation or correspondence only, is also proffered through this medium.

While current activities of all descriptions will be reported in these Chapters, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added to that list in the future as they are completed.

The Chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful latent resources of the State of California.

'Mining in California' is sent without charge to those on the Bureau's exchange list and to all others who make written or verbal request.

Pages are numbered consecutively throughout the year and an index to the complete reports will be included annually in the December number.

ANNOUNCEMENT.

In future, the publication of 'Mining in California' will be quarterly instead of monthly, and the next issue will be dated July, 1923. We find this action necessary principally owing to lack of available funds to meet the cost of printing.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each division working out from a local branch office.

This move brought the Bureau into close personal contact with operators, but did not materially shorten the time between the gathering of data in the field and their publication in the Report of the State Mineralogist at the end of an annual or biennial period.

Mining activities and development noted by district engineers in their respective fields are now embodied in monthly reports published in each issue of 'Mining in California,' thus making these data available within a maximum period of thirty days, and the Monthly Chapter as far as possible a compendium of current mining progress throughout the State.

The counties included in each field division and the location of the local offices are shown on the accompanying outline map of the State. (Frontispiece.)

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the State's oil fields is included under this heading.

REDDING FIELD DIVISION.

W. BURLING TUCKER, Mining Engineer.

Shasta County.

COPPER MINES.

Arps Group of Mines is located in sections 20, 21, 28 and 29, T. 34 N., R. 3 W., one and one-fourth miles north of Copper City, in the Pittsburg Mining District. It comprises fifteen patented claims, totaling 250 acres, adjoining the Copper City claims of the Shasta Zinc and Copper Company. Owners are William Arps and R. M. Saeltzer of Redding. Elevation 900 to 1200 feet. The property is located on the Copper City lode; the shear zone in which this lode occurs traversing the Bully Hill rhyolite and having a general course of N. 30° W. The ore is pyrite, sphalerite and chalcopyrite with barite as a gangue. Developments consist of six tunnels, two shafts and several crosscuts and winzes, aggregating over 3000 feet. The most extensive workings are confined to the Globe, Hearst and Kaiser Wilhelm claims, as follows: No. 1 tunnel on the Globe claim is 120 feet long, coursing N. 45° E. Seventy feet from the portal a winze has been sunk 25 feet deep and crosscuts run east and west. A streak of ore was developed which is said to have assayed \$40 gold, 5 per cent copper and 400 ounces in silver. No. 2 tunnel, which is located on the Globe claim, is a shallow tunnel 450 feet in length, course S. 55° W. for 100 feet, then east 360 feet. Some streaks of ore were developed that are reported to have carried high values in gold and silver.

Shaft No. 1, which is located near the southeast end of the Globe claim on Baxter gulch, was sunk to a depth of 50 feet, developing a lens of ore 8 feet wide, which is evidently the same ore body as was

developed in the Baxter shaft on the Baxter claim, owned by the Shasta Zinc and Copper Company. The ore extracted from this shaft is reported to have assayed 6 per cent copper, with \$28 in gold and silver values.

Some 200 feet northwest of this shaft there is a massive outcrop of iron, which shows a heavy percentage of iron pyrite. The course of this outcrop is northwest and dip about 50 degrees to the southwest.

No. 3 tunnel is on the Hearst claim and trends a little east of north, about 200 feet. Four crosscuts from 30 to 50 feet in length were driven to the east of these workings.

The third crosscut shows 26 feet of low grade ore, which is reported to carry \$6 in gold and 9 ounces in silver.

No. 4 tunnel, which is located on the Kaiser Wilhelm claim, is a crosscut tunnel driven N. 40° E., 500 feet. At 100 feet from the portal it cut a series of parallel fissures with strike N. 30° W. and dip 50 degree southwest showing ore carrying chalcopyrite, sphalerite, and pyrite. Several small lenses of ore were developed about 10 to 30 feet in length, and from 2 inches to 3 feet in width.

On the surface above No. 4 tunnel and about 150 feet south of No. 5 tunnel, in an open cut there is exposed 15 feet of sulphide ore, which occurs along the main shear zone.

No. 5 tunnel, which is located on the north end of the Kaiser Wilhelm claim, is driven N. 40° E., 400 feet. At a distance of 175 to 200 feet from portal it cut a lens of low-grade ore, containing galena, chalcopyrite, sphalerite and pyrite. On the surface about 100 feet above this tunnel, the shear zone is well-defined, having a general course of N. 30° W. dip 60 degrees southwest. Ore was mined at this point by open cuts and shallow tunnels, which is said to have carried high gold and silver values.

Several cars of ore have been shipped from the property to the Mammoth smelter at Kennett and are reported to have averaged \$20 per ton in gold and silver values.

Equipment consists of blacksmith shop and tools, compressor-house, Chicago pneumatic compressor, air drills, cars and track. Idle.

Bibliography: State Mineralogist's Report XIV, p. 761, Bulletin No. 50, p. 110.

Colma Copper Group of Mines, located in sections 6 and 31, T. 33 and 34 N., R. 5 W., 6 miles west of Kennett, in the Backbone Mining District. It lies between the Uncle Sam and Mammoth holdings, at an elevation of 2400 feet. Owners are, M. E. Dittmar, of San Francisco, and Louis Monahan of Winthrop, California. The property is under bond to the American Zinc, Lead and Smelting Company, 1012 Pierce Bldg., St. Louis, Missouri. C. B. Nichols, superintendent.

This group of claims is being developed through No. 5 tunnel level of the Uncle Sam mine in hopes of picking up the direct extensions of the Mammoth mine ore trends, along the so-called 'California fissure' or shear zone. The trend of the tabular ore deposition has been developed in the Mammoth mine, from the point of original exposure for a distance of approximately 5000 feet through the Mammoth property towards the Colma Copper boundaries.

This is a very interesting piece of development work, and the logical point for further and deeper development of the Mammoth ore bodies.

Twelve men are employed in driving the main crosscut tunnel, which has been driven about 2600 feet.

Shasta May Blossom Mine, is located in section 14, T. 34 N., R. 3 W., one mile north of Winthrop, in the Pittsburg Mining district, and comprises twenty-six unpatented claims, known as the Keith group. Owners are Shasta May Blossom Mining and Smelting Company, C. M. Bradley, president; E. Seaburg, secretary. Offices, 604 Mills Building, San Francisco.

The property is located along the contact of Bully Hill rhyolite and black and gray shales, the latter being the footwall. The top of the mountain is capped with rhyolite, and on the east slope of the ridge are gossan croppings.

On the east slope of the ridge at an elevation of 1250 feet the main working tunnel has been driven N. 50° W., 720 feet, then due north 26 feet. The formation passed through in these workings is meta-andesite. At 320 feet from the portal, a drift has been run S. 70° W., 120 feet. In this drift a winze has been sunk to a depth of 18 feet. It is reported a small lens of ore was developed in the winze which is said to have carried high values in gold and silver. On the surface above this tunnel near the top of the ridge, there are gossan croppings about 160 feet in width. North of this tunnel at an elevation of 1350 feet, what is known as the Porter tunnel is driven due west 600 feet, and at 250 feet from the portal of the tunnel, a raise was run to the surface, a distance of 100 feet, and connected with a tunnel from the west slope of the ridge. It is reported that a shoot of ore was developed in this raise, about 40 feet in length and from four to six feet in width, which was said to carry 6 per cent copper and \$8 in gold and silver. On the slope of the ridge south of this tunnel there is a body of gossan croppings, probably 60 feet wide. On what is known as the Kitchen claim, about the center of this group of claims, north of the above mentioned workings, there is a shallow tunnel 80 feet long, which developed a lens of sulphide ore, the general course of which is N. 20° E., dip 35 degrees east. The lens is 50 feet in length, and 8 feet wide. Ore is principally iron pyrite, with small amount of chalcopyrite. Last work on the property was done in January, 1921, when the company sunk a drill hole from the surface which connected with a drift from the lower tunnel, the depth of the hole being 170 feet. No ore was developed.

Equipment consists of Ingersoll-Rand, size 7 shot drill, and Domestic 9-h.p. gas engine, Rix compressor, driven by 50-h.p. General Electric motor, blacksmith shop, compressor building, bunk house, 1000 feet 3-inch air line, cars and track. It is reported that the company is planning to resume operations this summer.

Bibliography: State Mineralogist's Report XIV, p. 772, Bulletin No. 50, p. 100.

HORSE MOUNTAIN COPPER DEPOSITS.

Near the summit of Horse Mountain, west of the Bully Hill District, is an interesting occurrence of native copper, very small particles of which are scattered through a mass of altered igneous material chiefly of volcanic breccia or conglomerate of siliceous lavas. Farther southwest, near the head of Potter Creek, a number of prospects show small lenses of copper ores, but as yet no considerable ore bodies have been

disclosed. The ore occurs along east and west fractures along epidote dikes which occur in the Dekkas andesite on the western slope of Horse Mountain. The ore is chalcopyrite associated with iron pyrite in quartz gangue, and carried values in gold and silver. The most extensive showing of ore in the district has been on the Shasta Belmont group of claims.

Minnie Haley Group of Mines, is located on the west slope of Horse Mountain in Section 24, T. 34 N., R. 4 W., $1\frac{1}{2}$ miles northeast of Heroult. Elevation 1800 to 2000 feet. Owners are James Doyle, C. M. Allison of Copper City and George G. Dean of Redding. Holdings consist of eight unpatented claims.

Developments consist of four tunnels from 20 to 150 feet in length. At an elevation of 1800 feet a crosscut tunnel is being driven east 200 feet to cut an ore fissure bearing N. 50° E., which has been developed by a short tunnel 20 feet in length about 300 feet in elevation above this tunnel. In this short tunnel two feet of ore has been exposed, carrying bornite, chalcocite, chalcopyrite and some pyrite in a quartz gangue. On Minnie Haley No. 2 claim, there is a dike of epidote 8 to 15 feet wide, which strikes N. 80° E. and dips vertical. A tunnel has been driven east along this dike 160 feet. At 50 feet from the portal it cut a fracture which strikes N. 30° W., which was drifted on 30 feet to the northwest, developing 8 inches to 12 inches of ore. Near the face this tunnel cut another ore streak about 12 inches wide, which has a course of N. 50° E. Samples taken from these two ore showings are said to have assayed from 4 to 10 per cent copper, 5 to 10 ounces silver, and from \$2 to \$8 in gold.

To the north on the contact between the McCloud limestone and the shales of Nosoni formation, a tunnel has been driven 100 feet on a contact of limestone, and then 75 feet southeast in the shales but no ore has been developed on the contact. North of these workings in the limestone, some ore was developed on a N. 50° W. fissure. Shaft 20 feet deep. Two men employed on development work.

Shasta Belmont Group of Claims, formerly known as *Graham Group*, consists of nine unpatented claims, located in Sec. 24, T. 34 N., R. 4 W., $1\frac{1}{2}$ miles northeast of Heroult. Elevation 1850 feet. Owner W. E. Casson of Carson City, Nevada.

Developments consist of two tunnels driven east along an east and west fracture. The lower tunnel was driven N. 60° E., and then 350 feet east and there is a raise on ore from this level 50 feet to an upper tunnel. The upper tunnel is driven N. 50° E., 75 feet, then drifted 150 feet east along an ore bearing fissure. The ore developed was from 6 inches to 2 feet wide, and was stoped for about 50 feet in length. Ore is chalcopyrite, chalcocite, and pyrite in a quartz gangue. Three cars of ore were shipped from the property in 1915 to the Mammoth Smelter at Kennett. Idle.

Kane and Wilburn Group. Two unpatented claims in Sec. 24, T. 34 N., R. 4 W., $1\frac{1}{2}$ miles northeast of Heroult. Owners are Frank Kane and Archie Wilburn of Heroult. Elevation 1600 feet. A deposit of magnetite, with pyrrhotite, chalcopyrite and pyrite occurs in Dekkas andesite. The general course of the deposit is N. 50° E., and it is from 6 to 10 feet in width. Developments consist of a shaft 40

feet deep sunk on the outcrop and northwest of this shaft a crosscut tunnel driven north 50 feet, and a drift driven 200 feet southwest on ore. Idle, only assessment work being done on the property.

GOLD MINES.

Gold Bar Mines. This property comprises four unpatented claims, known as: Gold Bar No. 1, Gold Bar No. 2, Gold Bar No. 3, and Gold Bar No. 4, located in sections 22 and 26, T. 33 N., R. 5 W., 10 miles north of Redding, in the Churn Creek Mining district. Elevation 1600 feet. Owners are Frank O. Hollingsworth and Dr. G. A. Grotefend of Redding. The mine has not been worked since 1891, when ore was mined and hauled to the National Mill, where it is reported to have milled \$50 per ton. The property has been idle since that time, and was relocated in January, 1923. A vein of quartz four feet wide occurs in the meta-andesite, general course N. 30° W. and dip 55 degrees to the southwest. The outcrop of the vein can be traced for 6000 feet.

Developments consist of three tunnels driven on the course of the vein. The two lower tunnels are caved, but from the indications ore was stoped from the lower tunnel to the upper tunnel. The vein has been drifted on in the upper tunnel for 100 feet, developing an ore shoot 80 feet in length, and 4 feet in width. Samples taken from this vein are reported to assay from \$10 to \$15 per ton in gold. A raise from the intermediate tunnel connects with this tunnel, distance 30 feet. The present locators have two men employed cleaning out old workings, and are planning to drive a tunnel on the vein at a lower elevation.

Siskiyou County.

On the *Souza Ranch*, owned by George Souza, near Yreka, it is reported that in prospecting on the property, a vein of quartz has been developed, which carries values in tungsten, and also some veins carrying values in copper, zinc and gold.

H. J. Barton of Yreka, who is interested in a large deposit of limestone near Gazelle, is reported to have discovered some marble of good quality on the property.

H. M. Balfrey and *Thomas Park* of Yreka are reported to have discovered a deposit of tin ore in the East Fork Mining District, along the Siskiyou-Trinity County line, near Kangaroo Lake. A number of locations have been made, known as the *Kangaroo Group of Claims*.

On the *Rainbow Group of Claims*, located near Hawkinsville it is reported *Newton Gordon* and *T. C. Quinn* of Hawkinsville recently developed a vein of rich gold-bearing ore. The owners are planning to do an extensive amount of development on the property this summer.

There is a considerable amount of activity in placer mining at Hawkinsville this spring.

Tehama County.

The property of the *Tuscan Oil Company*, located six miles north of Red Bluff was recently sold at sheriff's sale to *Chas. H. Wood* of San Francisco. When the company suspended operations the well was down 1700 feet.

Trinity County.

The Rebel Mine, located six miles up the South Fork of Trinity River from Forest Glen, in Sec. 31, T. 29 N., R. 12 W. Holdings consist of three claims, owner Jack Hoffman of Forest Glen. A vein of sulphide ore 4 feet wide has been opened up along a contact of black slate and quartzite. The ore is chalcopyrite associated with iron pyrite in quartz gangue. Samples taken from the vein assay 2 per cent copper with gold and silver values. A shaft is being sunk on the vein.

Precious Twins Placer Mine, located in Sec. 17, T. 4 N., R. 6 E., 12 miles north of Hyampom on the South Fork of the Trinity River, is being operated by Frank Lynch of Hyampom. Holdings consist of 200 acres: Two men are employed.

AUBURN FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

Amador County.

The immense undeveloped clay resources of this county continue to be exploited in a small way and from time to time new pits are opened. The thousands of acres of potential clay land in the Ione-Carbondale district have never been systematically drilled, probably because the demand for clay has not been great enough yet to put any tax upon the areas known to be good clay land and already opened. The fact that so much of the land has been under one ownership may also have had some effect upon progress in this direction.

The following clay working establishments have in late years been buying part, and in many cases all, of their clay in this district. The list indicates the wide variety of uses to which the clays of the district are adapted.

Manufacturers using clay from the Ione-Carbondale district:

California Pottery Company, Oakland.
N. Clark and Sons, Alameda.
Craycroft and Knight, Fresno.
Gladding, McBean and Company, Lincoln.
Livermore Pressed Brick Company, Livermore.
Muddox Pottery Company, Sacramento.
Oakland Art Pottery Company, Oakland.
Pacific Porcelain Ware Company, Richmond and San Pablo.
Richmond Pressed Brick Company, Richmond.
West Coast Porcelain Company, Millbrae.
Ione Firebrick Company, Ione.
Furlong-Poxon Pottery Company, Vernon.
Los Angeles Pressed Brick Company, Los Angeles.
Stockton Fire and Enamel Brick Company, Stockton.
Garden City Pottery Company, San Jose.
Pacific Coast Pottery and Terra Cotta Company, San Jose.

No absolutely white-burning clay has been developed in the district yet. Some clays have been produced by washing and settling that are pure white before burning, but still contain a fraction of one per cent of iron oxides, enough to give a light straw color on burning, and these have been used for heavy hotel ware and porcelain. From this color the

clays range through various shades to a strong mottled red, which burns red and is used for tiling. Much of the white clay is nearly half quartz sand, giving low shrinkage and low absorption and a fusibility over 3000 degrees, and these qualities make it a good fire clay, eminently suited for fire brick. This sandy clay runs about 70 per cent silica, 20 per cent alumina, $1\frac{1}{4}$ per cent iron oxides, 0.3 per cent CaO, and 0.2 per cent MgO. Other samples where the proportion of sand is lower run up to 34 per cent alumina and correspondingly less silica, but in general are claimed to be typically low in lime. Occasionally pits have been started in low ground that had to be abandoned on account of gypsum seams in the clay, but these are erratic in occurrence.

The use of sand from these white clays for making glass was the result of war conditions which shut off supplies of foreign glass sand. With large contracts to fill, a large glass company took over a plant at Antioch and shipped in 1918 nearly 15,000 tons of clay-sand from Carbondale to the plant, where the sand was washed. The demand ceased when the cheaper Belgian glass sand could be had again.

The mining and hauling of the clay is cheap here even with the present small-scale operations, and freight rates to the principal markets around San Francisco bay are low. A broad-gauge railroad traverses the clay belt, making the haul from the pits to the loading stations short. Laborers in the pits receive \$3.50 a day and specially trained men more. A soil and sand overburden generally has to be removed, varying in thickness from a few inches up to 20 feet, but where this is too thick the clay may be mined by wide, high drifts with pillars. Most of the work has been done by hand, but there is one steam shovel in use. Thirty per cent dynamite is used for blasting. Detailed cost figures cannot be shown as the business is closely competitive.

Changes since our report of 1920, entitled 'The Clay Industry in California' have been noted during a visit made this month.

Amador Kaolin Co. is no longer operating. This was a subsidiary of the *Illinois Pacific Glass Co.* and mined a large quantity of sandy clay during the war. The sand was washed in a plant at Antioch and used for glass. The market collapsed as soon as the Belgian sand imports could be resumed. The foreign sand is said to be mined in large quantity at very low cost, requires no treatment, and even in its crude condition is claimed to be superior to the local washed product.

W. D. Amick Property, formerly operated under lease by the Philadelphia Quartz Company, is idle since the company quit the production of domestic sand. They worked this property about three years, mining the clay-sand and washing it in the plant described in our bulletin, 'The Clay Industry in California,' and using the sand in the manufacture of sodium silicate. They have lately sold their mining equipment and are said to have returned to the use of Belgian sand.

Bacon and Bacon. Mark J. Bacon, manager, Ione. They do a general clay mining and shipping business. They employ 15 to 20 men and supply a variety of clay to a number of plants. The products made from these clays are diversified, including pressed and fire brick, architectural terra cotta, building tile, high-grade pottery, sewer pipe and porcelain ware. The clays range in color from the white clay-sand to a strong red mottled clay. This firm owns some clay land near Carbon-

dale, works other clay pits under lease and mines clay in some cases under contract for the owners and consumers. They have lately bought the mining equipment of the Philadelphia Quartz Co., including a steam shovel, and have moved it to Carbondale.

Mrs. W. W. Carlile Property near Ione contains a deposit of fine white clay and sand. It is undeveloped.

N. Clark and Sons own about 200 acres in the clay belt near Carbondale, from which they obtain high-grade clay for their pottery at Alameda. Clay is mined under contract for them by Bacon and Bacon.

Ione Firebrick Company continue operation of their plant near Ione for the manufacture of fire brick. A crew of nine or ten men are employed. The kilns are in operation most of the year, but the season for making bricks begins about March 15. They make about 20,000 bricks a day for eight months, and the kilns have a capacity of about 11,000 bricks a day, leaving 9000 a day to store for winter. The product is of good quality and finds a market anywhere in the Pacific Coast region where freight rates are favorable. Wm. Brown is manager.

Livermore Pressed Brick Company is planning to open a new clay pit on the J. M. Fancher property, about 4 miles from Ione, to supply their plant at Livermore. H. L. Bramwell is in charge.

McKissick Cattle Company owns a grant called Rancho Arroyo Seco, containing some 33,000 acres of land in the Ione-Carbondale clay and lignite belt, and mineral rights under several thousand acres more. Much of this land is known to be underlain by valuable clay deposits, but it has not been adequately drilled, so the full extent of the deposits is not known. The quality of the clay is also, therefore, an uncertain factor. Many of the firms using clay from this district get it from this property.

Newman Clay Company of Ione is employing 13 men at present (March 10) at its clay pits a mile from Ione at Newman Siding. This company digs white fire clay for sale to potteries and brick makers and has built up a good business from a small beginning. Where the overburden is heavy compared to the minable clay stratum, the latter has been worked by a system of wide drifts and pillars, but where the overburden is thin it is stripped by hand. The thickness of the workable layer of clay varies from 15 to 45 feet and it is underlain by a black stratum suggesting the proximity of lignite, though the latter has not been exposed here.

Philadelphia Quartz Company. Idle. See W. D. Amick property, *ante*.

COAL.

John Mocine is in charge of drilling operations on the Rancho Arroyo Seco, owned by the McKissick Cattle Company and taking in much of the country around Ione and Carbondale. The names and plans of those financing the drilling have not been divulged. An auger drill rig is being used and four men are employed. The drilling is being done for the avowed purpose of prospecting the lignite known to underlie the property and which has been mined in a small way by shafts and

drifts. It is the first comprehensive prospecting of this tract which contains about 33,000 acres, a considerable part of which will be drilled. The work already done has begun to shed new light upon the geology of the tract, according to Mocine. It has been thought in the past that the lignite occurred in relatively small deposits, in a chain of depressions once occupied by marshy lakes. Mocine thinks the present drilling is beginning to show that these basins are larger than supposed, or that the structure of country is monoclinial with the strata dipping gently toward the valley and with the coal much more widely distributed than previous operations indicated.

All of the holes so far drilled up to March 10 are said to have shown a good thickness of coal, the entire thickness of lignite stratum ranging from 21 to 30 feet, of which about 12 feet are classed as heart coal. The holes range from 15 to 40 feet deep on the upper edge, increasing to 81 feet deep 3000 feet westward. The property is thought to have interesting possibilities for a well financed company. A few years ago tests of the lignite in the district showed that it yielded up to 62 gallons of oil and 18 pounds of ammonium sulphate per ton, by destructive distillation and according to Mocine samples coming from the present drill holes are comparing favorably with these figures. Should the drilling show sufficient lignite, there are possibilities of a big new industry for the county. Incidentally, this prospecting is affording a great deal of new information about the extent and character of the clay beds in the rancho. Should the lignite ever be exploited in a large way by stripping, an immense amount of clay will be made available at very low cost.

The high yield of oil from this lignite raises very interesting questions as to the genesis of the oil. The lignite shows plainly its derivation from coniferous trees, the partly changed wood and fragments of unchanged bark being very common. When wet it has a clayey appearance but dries to a brittle and easily broken mass that will not stand transportation well. Good briquettes can be made from it, some having been made in a plant put up years ago. These are said to have been made without adding any binder.

SAN FRANCISCO FIELD DIVISION.

C. MCK. LAIZURE, Mining Engineer.

Inquiries handled in the San Francisco office during the past thirty days indicate that mining conditions in this district continue to improve.

This is particularly true of quicksilver operations, gold quartz mining in Mariposa County, and among the magnesite and other structural and industrial mineral producers; however, as no field work was undertaken, detail reports must be deferred until an opportunity is found to confirm reported activities by personal visit.

LOS ANGELES FIELD DIVISION.

M. A. NEWMAN, Mining Engineer.

Kern County.

The Standard Consolidated Gold Mining Company, which owns the old *Exposed Treasure Mine*, situated 5 miles south of Mojave, is running a crosscut tunnel to cut the Exposed Treasure and other veins

at depth, and also unwater the old mine workings. This work has been under the direction of Consulting Engineer, D. B. Myers. In view of the large production of the Exposed Treasure Mine in the past, this piece of exploration work is well warranted. If commercial ore is encountered, the Mojave District will become the center of much activity.

The discovery of the Yellow Dog Mine a little over a year ago, which lies but a short distance from the Exposed Treasure Mine, has attracted considerable attention to the camp.

Los Angeles County.

Amargosa Talc Company. This company has just completed and put into operation a talc grinding plant in Los Angeles. The raw material comes from its talc mines in Death Valley. The talc is primarily to be ground and used in the manufacture of talcum powder and as a filler for paper. It is estimated it will have a capacity of 500 to 600 tons per month.

A. Getty, president; John F. Sherran, secretary; R. W. Glendenning, general manager. Office: 224 Santa Fe avenue, Los Angeles, Cal.

Catalina Island Quarry. The tremendous expansion in building and road construction in Los Angeles and vicinity is creating an increasing demand for crushed rock of good quality. To fill this need *Graham Brothers* are now opening a rock quarry near Pebbly Beach at the Isthmus on Catalina Island. The quarry is being equipped with the best machinery obtainable in the way of compressors, rock drills, conveyors and other necessary accessories to obtain minimum costs in operation. The rock will be barged direct to San Pedro and from there sent by rail to Los Angeles and adjacent points.

It might well pay land owners within reasonable distance of Los Angeles to look into the character of the rock on their holdings, for good quality of rock, sand, gravel, limestone, clay or gypsum is in much demand at present.

Magnesium Materials Company. This company has been formed for the manufacture of magnesium oxychloride, and has received a permit from the Corporation Commission to sell its preferred and common stock, in amount \$25,000.

It will maintain a factory and office at 809 North Main street, Los Angeles.

San Bernardino County.

California Rand Silver, Incorporated. At the beginning of March, this company issued its regular dividend No. 38, calling for a distribution of \$25,600, which makes a total in dividends since January 1, this year, of sixteen cents, or \$204,800.

Extraction and Advancement.

During the month of February, extraction from the mine was as follows:

| | |
|-----------------------|-------------|
| Milling ore..... | 6,772 tons |
| Shipping ore..... | 800 tons |
| Waste | 3,928 tons |
| Total extraction..... | 11,526 tons |

The total advancement in all workings in the mine during the month was 1157 feet.

| | |
|----------------------------------|------------|
| Ore to the mill----- | 9,163 tons |
| Concentrates to the smelter----- | 387 tons |
| Ore to the smelter----- | 756 tons |

Of the ore milled, 2,391 tons came from the mill dump.

The Mill.

During the month of February, the daily average tonnage of the mill (28 days) was 327 tons. The daily average, running time, was 353.75 tons. The lost time during the month was 26 hours and 42 minutes, being largely due to power off, water shortage and the time necessary for repairs.

| | |
|--|------------|
| Total average value of heads for ore milled----- | \$16 32 |
| Total average value of tails----- | 1 84 |
| Recovery per ton----- | 14 48 |
| Total recovery on 9,363 tons----- | 132,698 56 |
| Average concentrate value per ton----- | 354 34 |
| Tons concentrates produced----- | 374.5 |
| Tons concentrates shipped----- | 378 |

At the meeting of the board of directors held March 3, it was determined to increase the company's surplus to one-half million dollars, the reasons for the increase being set forth in the following resolutions:

WHEREAS, When the provisions of the Pittman Act shall have been complied with, which will probably be in the late fall or early winter of this year, the price of silver, according to the best authorities, will greatly decrease; and

WHEREAS, It may be advisable in the ensuing year for the company to be in a position to hold its silver bullion from time to time in order to take advantage of the best prices, the fluctuations of the market considered; and

WHEREAS, Where the income tax for this corporation, payable in 1924 and based upon production in 1923, will be as heavy as in former years, the earnings of the corporation for the said year 1924 bid fair to be greatly reduced because of the lessened price of silver; and

WHEREAS, A considerable additional sum may be due the government under adjustment of our income taxes for 1919, 1920 and 1921; and

WHEREAS, An experimental one-ton reduction plant is now in operation which it is hoped and believed will demonstrate that it will be possible to reduce our concentrates to bullion, thereby saving heavy smelting and shipping charges, in which event a twenty-ton reduction plant will be required, the cost approximating \$75,000; therefore, be it

Resolved, That to meet these conditions, possible and certain, a largely increased surplus at the close of this year will prove most advantageous to the future successful conduct of the business of the corporation, it is therefore ordered and directed that, beginning with this date, the monthly earnings of the company, over and above the sum required to meet the regular monthly dividends, shall be applied to the surplus until such fund shall have reached the sum of \$500,000.

Financial.

Returns from the smelter for the month total \$178,462.73.

After paying this dividend, meeting the month's expenses, and paying \$30,000 on income tax, the company has a cash balance of \$294,450.36, an increase in surplus over last month of, roundly, \$40,000.

The Copper Basin Consolidated Mines Company, with large holdings in Copper Basin, at Monumental Peak, is preparing for continuous operations.

The property is located eleven miles north of Drennan, a station on the Parker cut off of the Atchison, Topeka and Santa Fe Railway on the Colorado River.

Installation of a new hoist on its 300-foot incline shaft has just been completed.

The company claims to have a vein of copper sulphide ore 8 feet wide, which will average 6 per cent copper. It is the intention to mine and ship this ore to the Humboldt smelter. Besides ore of a shipping grade, there is a considerable tonnage of low grade copper ore for which a plant will be built in the future.

J. L. Curtis, of Los Angeles, is president and Jas. C. McDowell, superintendent of the company. Main office: Lankershim Building, Los Angeles.

San Diego County.

The Duralite Company, Incorporated, has recently acquired control of the International Magnesium Products Company, whose plant is located at Chula Vista. This plant, which has now been idle for over a year, has been equipped with new machinery and will have a production of 400 to 500 tons per day of magnesite building products. The magnesite used is obtained from deposits in Lower California. The company has a field in which it can expand its operations to large proportions, as there appears to be no slowing down of the building program in southern California.

President, Dr. C. S. de Mey; Secretary and General Manager, Mr. Swartz.

General office: Marsh-Strong Building, Los Angeles.

The General Petroleum Company is reported to have purchased 640 acres of otalite deposits from R. E. Harrison of San Diego. It will use the otalite in the refining of its oils. The company has spent considerable time in experimental work in making this material suitable for its refineries. Otalite, as it is called locally, is in reality a variety of montmorillonite, a mineral of the clay group, carrying a large percentage of combined water, and is a hydrous silicate of alumina. It is quite soft, has a soapy feel and occurs white, grey, or pink.

OIL FIELD DEVELOPMENT OPERATIONS.

H. E. COLLOM, State Oil and Gas Supervisor.

From February 10, 1923, to and including March 10, 1923, the following new wells were reported as ready to drill:

| Company | Sec. | Twp. | Range | Well No. | Field |
|-------------------------------------|------|------|-------|---------------|------------------|

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau, as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff containing much information that will add to the permanent value of the Monthly Chapter are included in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

NOTES ON PEAT AND ITS OCCURRENCE IN CALIFORNIA

By C. MCK. LAIZURE.

In 1921, the last year for which figures are available, California led all other states in the Union in the production of peat. Up to the present time the peat produced here has not been utilized as a fuel, and the State Mining Bureau has never made a field investigation or survey of the state's peat resources, nor collected production statistics as it has in the case of petroleum, coal, and natural gas. The occurrence of peat in Orange and Humboldt counties was briefly noted, however, in the Tenth and Eleventh Reports of the State Mineralogist, 1890-1892.

Inquiries from various sources have come to the State Mining Bureau during the past few years regarding the possibilities of the peat industry, and for the purpose of supplying some facts regarding this little known product and the localities in which it is found, the following notes have been compiled.

No claim to originality is made, most of the data herein having previously appeared in various publications, particularly the Journal of the American Peat Society; Transactions of the Commonwealth Club of San Francisco, 1912, and the United States Geological Survey Bulletin No. 728, 1922.

Peat is defined as the organic residuum resulting from the arrested decomposition of leaves, twigs, roots, trunks of trees, shrubs, mosses, and other vegetation in areas continually covered or saturated with water.

It may be identified as the dark-colored soil found in bogs and swamps, commonly called muck, but if the material will ignite and burn freely when dry, it preferably should be termed peat.

Native peat contains about ten per cent of solid matter and ninety per cent of water. Its specific gravity ranges from 0.1 to 1.06 and it weighs from 7 to 65 pounds per cubic foot. The reduction of its high content of moisture is the paramount necessity for commercial utilization. Attempts have been made to remove the excess moisture by com-

pression, but it resists the heaviest pressure and its water content can be economically reduced only by evaporation.

The texture of peat depends upon the kinds of plants from which it was formed and the physical conditions under which it accumulated. It has been classified by its physical characteristics as turfy peat, fibrous peat, earthy peat, and pitchy peat.

Peat ranges in color from light yellow through various shades of brown to jet black, the color representing in a measure the degree of decomposition.

Chemically peat consists of carbon, hydrogen and oxygen and relatively small quantities of nitrogen. Its composition is illustrated by the following analysis (ash and moisture omitted) :

| | |
|----------------|--------|
| Carbon | 59.50 |
| Hydrogen | 5.50 |
| Oxygen | 33.00 |
| Nitrogen | 2.00 |
| | <hr/> |
| | 100.00 |

The quantity of 'fixed' or 'free' carbon generally ranges from 10 to 60 per cent, the remainder being combined with other elements. Volatile matter usually ranges from 25 to 70 per cent, and moisture from 15 to 30 per cent in air-dried peat. As the volume of oxygen is relatively high, good peat ignites readily and burns freely, leaving little unconsumed residue. Sulphur usually ranges from 0.2 to 0.6 per cent, and nitrogen from 1 to 4 per cent. The ash in native peat, which renders it more or less impure, constitutes from 3 to 30 per cent of its dry weight. The ash content of the best peats in the United States ranges from 6 to 12 per cent, though many of the largest deposits in the Great Lakes area contain 15 per cent of ash.

The value of peat in soil fertilization lies in its content of nitrogen and humus and in the beneficial mechanical effect it produces on certain lands. Black, well-decomposed peats are the most satisfactory ordinary fertilizers, for they are generally heavier and more compact and contain more nitrogen and less fibrous material than the brown peats.

More than 50,000,000 tons of peat fuel are consumed annually by European countries, but only small quantities of peat fuel have been produced in the United States. Operators say that air-dried machine peat can be produced in the United States for from \$1.50 to \$5.00 per ton and that it could perhaps in some localities successfully compete with other fuels for domestic and industrial purposes.

Many extravagant claims concerning the fuel value of peat have been made, but authorities have concluded that peat can be converted into fuel on a large scale in the United States only in the form of machine blocks, powder, and gas.

Machine peat which is allowed to dry slowly contracts into a dense mass covered by a gelatinous skin-like substance called hydrocellulose. After the moisture has been reduced to about 25 per cent this coating renders the machine peat impervious to water, even when immersed. It is clean to handle and burns freely, yielding an intense heat and producing no soot or other objectionable deposit. For open grates this fuel is nearly ideal, and it is said that it may be burned in the same stoves as wood or coal.

For certain commercial uses powdered peat has many advantages over machine peat. In this form it may be blown with compressed air into the furnace where by means of forced draft, ignition is almost instantaneous and instead of burning on the grate the peat forms a gas which gives a uniform fire throughout the combustion chamber. Good peat thus treated when burned in furnaces designed to give the most complete and efficient combustion, will generate nearly as much energy in the form of live steam as the same weight of powdered coal. According to reports in this country, powdered peat has great possibilities, not only for boiler firing but for metallurgical work and for use in cement and other kinds of kilns in which powdered coal has been successfully burned.

Peat can also be made into briquets with a suitable binder, and although there are some advantages in the matter of cleanliness and less bulk, these advantages are largely offset by the high cost of production.

Peat coke is manufactured in Europe, and it is said to be equal in quality to the best grades of wood charcoal.

Alcohol, acetic acid, ammonia, ammonium sulphate, paraffin wax, illuminating and lubricating oil, phenol and asphalt are some of the valuable by-products obtained in coking peat by the dry distillation process.

Probably the most economical way to utilize peat as fuel is in the gas producer. Tests with Florida peat, carried on by the United States Geological Survey relative to using the producer gas for generating power, or peat under boilers for generating electricity by steam, showed that 5.78 pounds of dry peat per electrical horsepower hour were required by the steam plant, compared to 2.39 pounds with the gas producer.

Tesla coal, when used in the producer plant, required 2.38 pounds of dry coal, showing that Florida peat and Tesla coal are equivalent in this respect. It may be remarked here that the climatic conditions under which peat is formed in California are somewhat similar to those in Florida.

In comparing the gas obtained from peat with that from coal as to the heat units per cubic foot, the following results were obtained:

| | B.T.U. per cubic foot |
|------------------------------|--------------------------|
| Massachusetts peat----- | 166 |
| Florida peat----- | 175 |
| Kentucky coal (average)----- | 164 |
| Illinois coal----- | 143 |
| Tesla (Cal.) coal----- | 158 |

These figures show that peat gas has a higher heating value per cubic foot than that from the better gas-making coals. It should make an excellent fuel for ceramic kilns, lime and cement kilns, metallurgical furnaces, forges, ore-roasting and similar furnaces.

A complete description of peat-fuel machinery and manufacturing processes will be found in United States Bureau of Mines Bulletin No. 16, 'Uses of Peat,' 1911.

There are many uses for peat other than for fuel purposes. Peat moss, marsh grass and fibrous peat are employed in the manufacture of surgical dressings, of rugs and carpets, of packing material, of artificial wood, of paper, and of substitutes for cotton and woolen cloth.

From October, 1917, to November 11, 1918, the Northwestern and Atlantic divisions of the American Red Cross prepared 595,540 peat-moss pads for surgical use. Most of the moss was gathered from bogs in Washington, Oregon, and Maine, and the pads were used in military hospitals at home and abroad.

Peat has lightness, resiliency and antiseptic properties and makes excellent packing material for eggs, fruit, vegetables, and fragile articles. Peat moss is utilized in shipping flowers, shrubs and plants. Dry peat is a non-conductor of heat and is valuable in ice houses and as a packing for water pipes.

In the United States peat at present is utilized chiefly as an ingredient of fertilizers and stock food and as a crop soil.

The United States contains about 12,000 square miles of undrained land estimated to be capable of yielding nearly fourteen billion short tons of air-dried peat. The average deposit will yield two hundred tons per acre-foot. The peat areas are distributed throughout the Great Lakes, New England, and Atlantic and Pacific Coast states. Minnesota, Wisconsin, Florida, and Michigan contain the most extensive deposits. The peat deposits of Canada cover 37,000 square miles.

The area of peat deposits on the Pacific Coast is small compared to that in the Northern and Atlantic coastal region, and this fact adds interest to the statement made at the beginning of this article, that in 1921 California was the largest producer of peat in the United States.

In that year the peat industry throughout the country suffered by reason of the decrease in the selling price of agricultural products, which, combined with high freight rates prevented farmers from purchasing fertilizer. The following table shows the production in the United States from 1916 to 1921:

| Year | Number of plants reporting | Short tons | Value | Average price |
|------------|----------------------------------|---------------|-----------|------------------|
| 1916 ----- | 13 | 52,506 | \$369,104 | \$7 03 |
| 1917 ----- | 18 | 97,363 | 709,900 | 7 29 |
| 1918 ----- | 25 | 107,261 | 1,047,243 | 9 76 |
| 1919 ----- | 15 | 69,197 | 705,532 | 10 20 |
| 1920 ----- | 18 | 73,204 | 921,732 | 12 59 |
| 1921 ----- | 21 | 30,406 | 260,119 | 8 55 |

The twenty-one plants reporting production in 1921 were distributed as follows: New Jersey 4, New York 4, California 3, Illinois 2, and Florida, Georgia, Massachusetts, Michigan, Minnesota, New Hampshire, North Carolina, and Wisconsin 1 each. California was the largest producer, with an output of 12,672 short tons, valued at \$117,580. New Jersey ranked second, with an output of 12,051 tons, valued at \$94,269. Illinois ranked third,

The three California producers noted above all operated in southern California, but it is understood that another operator has since begun producing from the Sacramento-San Joaquin delta area. In October 1922 it was said that three cars per week were being shipped by this operator.

The thickest deposits in this state are believed to underlie the area following a line traced around the edges of the marshes and extending from Carquinez Straits to Stockton to Rio Vista, closing at the point of commencement again and covering an area in all of approximately twelve townships, 432 square miles, or 276,460 acres with peat to a thickness of from 6 to 80 feet, or an average of 43 feet. A large portion of this expanse, particularly in the eastern part, has been covered by debris from our early hydraulic mines, while in other portions the peat is more or less sandy. This acreage noted is therefore divided by two, giving as a result 138,248 acres. Of this area 60,000 acres are known to contain good peat to a depth of at least six feet or more. In one acre of land two hundred tons of machine-dried peat are recoverable for each foot of raw material. The 60,000 acres will therefore contain 60,000 x 6 x 200 or 72,000,000 tons which will be placed as proved. The 138,248 acres with 43 feet of peat would contain 138,248 x 43 x 200, or 1,188,932,800 tons. The amount of peat in this area under consideration is given as follows:*

| | |
|----------------|--------------------|
| Proved ----- | 72,000,000 tons |
| Possible ----- | 1,188,932,800 tons |

No attempt has been made at any accurate estimate in the preceding figures, as such would be impossible from any existing data. It is highly probable that a large portion of the 'possible' area will be found unavailable because of mixture with silt. It is also unfortunate for the peat industry that this land is among the most valuable in California for agricultural purposes and it is questionable if peat products will prove more remunerative than those of agriculture.

Shallower peat beds are also known to exist in parts of Sutter and Yolo basins, throughout the marshes of San Francisco Bay, in the marshes near the mouth of the Salinas River and in that portion of Klamath Lake located in California. Peat also occurs in Humboldt, Siskiyou, Los Angeles, Orange, and San Bernardino counties, but these localities do not begin to compare in possibilities with those of the lower Sacramento and San Joaquin River area.

The peat industry already developed in California, despite an almost total lack of definite data regarding occurrences of this interesting raw material, would indicate that it is a product whose possibilities are far from being fully realized and one well worthy of further study.

*Requa, M. L., Bradley, F. W., and Stalder W., Fuel Resources of California; Commonwealth Club of San Francisco, Trans. 1912.

SECRETARY'S OFFICE.

WALTER W. BRADLEY, Deputy State Mineralogist.

The California State Mining Bureau was created April 16, 1880, by legislative act. In March, 1893, the original act was repealed and an amended act approved and passed by the legislative body. Again on June 16, 1913, a new Mining Bureau Act was approved which became effective August 10, 1913, repealing all former acts, and forming the basic law under which the Bureau now functions.

It is doubtless true that both the mining and lay public have not in the past always recognized the part played by the Bureau in the development of the state's mineral resources. Innumerable inquiries regarding them, originating within and without its borders and in foreign countries, have been answered with ultimate results reflected by a consistent growth in the value of the state's mineral output since the records of production were first compiled by the Bureau in 1887.

This organization has been occupied for 43 years in actively and in all possible ways assisting in the development of California's mineral resources. Its work, whenever possible, is made a matter of permanent record by means of published bulletins and reports. These publications form a cumulative, live and up-to-date history of mining progress in the state. Prospective investors from other states and other lands come to the State Mining Bureau for information as to the location of mineral deposits, the extent and value of their mineral content, and names of owners with whom they may enter into business transactions. Owners and operators—producers of raw materials—come to the Bureau to find out where they may be able to market their output, and to learn whether or not the mineral they have discovered is commercially valuable, and if it meets the requirements of the consumer.

It is believed that a fuller understanding of the economic position occupied by the Bureau can be imparted to the public, whose funds support it, by embodying in these chapters a review of the executive activities. The responsibility for the coordination of effort of each department, to the end that the utmost efficiency may be maintained with the limited and variable appropriations accorded the Bureau by successive legislatures, rests upon the administrative office.

Activities referable to that office, such as reports of new maps and publications issued, amount of mail handled, changes and enlargements in offices, changes in personnel of the staff, property and equipment, financial statements, etc., are therefore included herein.

New Publications.

During the month the following Bureau publications have been made available for distribution:

Summary of Operations, California Oil Fields, November, 1922, Vol. 8, No. 5.
Mining in California, November, 1922, Vol. 18, No. 11.

Distribution of Publications.

The Bureau's publications are constantly in demand, requests for copies coming from all over the United States and foreign countries. Publications were distributed during the month as follows:

| Publications | Number Distributed |
|--|--------------------|

Mails and Files.

The Bureau maintains in addition to its correspondence file a mine report file which includes reports on some 7500 mines and mineral properties in California. Also there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the month 774 letters were received and answered. They are practically all requests for information and the inquiries cover all phases of prospecting, mining and developing mineral deposits, reduction of crude minerals and marketing of refined products.

Drafting Room.

This is purely a workshop, and is the only branch of the Bureau that is not primarily at the service of the public. In the drafting room

well logs, maps, sketches, etc., are prepared for the many publications and reports which are under way at all times.

Changes in Personnel.

Announcement is authorized of the resignation of Mr. W. W. Thayer, as secretary, who leaves the State Mining Bureau after a service of seventeen years in the department.

Mr. Walter W. Bradley, for several years past statistician and curator of the State Mining Bureau, has been promoted to the position of deputy state mineralogist, which position will combine the duties formerly exercised by the 'chief mining engineer' and the 'secretary.' With additional clerical assistance, Mr. Bradley will also supervise the work of the statistical division.

DIVISION OF MINERALS AND STATISTICS.

Statistics, Museum, Laboratory.

WALTER W. BRADLEY, Deputy State Mineralogist.

STATISTICS.

California produces commercially at least fifty different mineral substances, with a total annual value averaging in recent years in excess of \$250,000,000. There are several thousand operating properties, including mines, quarries, oil and gas wells, mineral springs, gravel pits, mills and smelters. The task of compiling accurate and dependable statistics covering these activities is a difficult one, requiring care and a technical knowledge of properties and processes.

Blank report forms for the 1922 data were mailed to the operators, in January, 1923, followed by a 'second request' early in March. At present writing (March 15), the majority of the reports are in hand. Data for several substances are now complete and have been compiled, being presented herewith.

The data at hand indicate that there was no production in California of the following substances, which have at one time or another in the past been on the active list here: Antimony, bismuth, cadmium, mica, molybdenum, nickel, nitrates, serpentine, sulphur, strontium, tin, tungsten, vanadium.

ALUMINUM.

Bibliography: Bulletins 38, 67. U. S. G. S., Min. Res. of U. S.

To date there has been no commercial production of aluminum ore in California. The first authentic find of bauxite in this state was noted in the April, 1922, issue of 'Mining in California' (see Report XVIII, page 198; also 'Pacific Mining News,' p. 13, May, 1922). It is in Riverside County, southeast of Corona, but as yet undeveloped.

Minerals containing aluminum are abundant, the most widely distributed being the clays. There are only two, however, thus far of consequence, commercially, in the production of the metal: bauxite (to which may be added the related, hydrated oxides, hydrargillite and diaspore), and cryolite. Cryolite is found in commercial quantities only in South Greenland, and was formerly the only ore of aluminum used, being still employed as a flux in the extraction of the metal. Bauxite has been, for some years, the most important source of aluminum and its salts. Its color varies from gray to red, according to the amount of iron present, the composition ranging usually between the following limits: Al_2O_3 , 30%-60%; Fe_2O_3 , 3%-25%; SiO_2 , 0.5%-20%; TiO_2 , 0.0%-10%. Besides its reduction to the metal, bauxite is also utilized in the manufacture of: aluminum salts, refractory bricks, alundum (fused alumina) for use as an abrasive; and in the refining of oil (stated to be of growing importance). The most important producing countries, both of bauxite and the metal, are the United States and France, the former yielding more than 60 per cent of the world's output. In 1913 France led.

Because of its light weight (2.58 specific gravity), the metal, aluminum, has many important industrial uses, particularly in the manufacture of aeroplanes, airships, automobiles, cooking utensils, and electrical

apparatus. The use of aluminum dust in place of zinc dust for precipitating precious metal from cyanide solutions is increasing. In the Thermit process of welding and casting, aluminum in fine grains or filings is mixed with the oxide (usually iron oxide) to be reduced.

Present quotations for aluminum are 23¢-24¢ per pound, according to grade, for the refined metal.

ANTIMONY.

Bibliography: State Mineralogist Reports VIII, X, XII, XIII, XIV, XV, XVII. Bulletin 38.

Production of antimony in California has been irregular, and small in amount except during the year 1916 when the high war-time prices permitted American producers, for a short period, to compete with Chinese antimony. The principal commercial production of antimony in California has come from Kern, Inyo, and San Benito counties, and other occurrences have been noted in Nevada, Riverside, and Santa Clara counties. The commonest occurrence is in the form of the sulphide, stibnite; but in the Kernville, and Havilah districts in Kern County there were notable deposits of the native metal, being among the few localities of the world where native antimony has been found.

California producers claim that they can not operate profitably unless the price of antimony be above 12 cents per pound. Present New York quotations are around 8 cents per pound.

Pure antimony metal, and manufactured antimony compounds are of considerable importance as pigments in the ceramic industry. The most important use of the metal, commercially, is in various alloys, particularly type-metal (with tin and lead), babbitt (with tin and copper), and britannia metal (with tin and copper).

The production of antimony in California by years since 1887 has been as follows:

| Year | Tons | Value | Year | Tons | Value |
|------------|------|----------|--------------|-------|-----------|
| 1887 ----- | 75 | \$15,500 | 1900 ----- | 70 | \$5,700 |
| 1888 ----- | 100 | 20,000 | 1901 ----- | 50 | 8,350 |
| 1889 ----- | | | 1902 ----- | | |
| 1893 ----- | 50 | 2,250 | 1915 ----- | 510 | 35,666 |
| 1894 ----- | 150 | 6,000 | 1916 ----- | 1,015 | 64,793 |
| 1895 ----- | 33 | 1,485 | 1917 ----- | 158 | 18,786 |
| 1896 ----- | 17 | 2,320 | 1918 ----- | | |
| 1897 ----- | 20 | 3,500 | | | |
| 1898 ----- | 40 | 1,200 | Totals ----- | 2,363 | \$199,050 |
| 1899 ----- | 75 | 13,500 | | | |

ARSENIC.

Bibliography: Bulletin 67. U. S. G. S., Min. Res. of U. S.

Arsenic is found in a number of localities in California in the mineral arsenopyrite (FeAsS), which is frequently gold bearing; and in scorodite ($\text{FeAsO}_4 + 2\text{H}_2\text{O}$), an oxidation product of arsenopyrite. The occurrence of realgar (AsS) has also been noted (see Report XVIII page 197). To date, there has been no commercial output of arsenic from California ores. The principal source of the arsenic of commerce

in the United States has been as a by-product from the metallurgical treatment of copper, gold, and lead ores. It is usually recovered in the form of the tri-oxide, or 'white arsenic,' for which there is a demand for the preparation of insecticides, for use in agriculture and horticulture, and especially against the cotton-boll weevil in the southern states.

BARYTES.

Bibliography: State Mineralogist Reports XII, XIV, XV, XVII. Bulletin 38. Eng. & Min. Jour.-Press, Vol. 114, p. 109, July 15, 1922; Vol. 115, pp. 319-324, Feb. 17, 1923.

The output of crude barytes in California during 1922 was 3,370 tons valued at \$18,925, as compared with 1921 production of 901 tons, worth \$4,809. This included, in part, witherite (BaCO_3) from the deposit at El Portal, Mariposa County, which yields both the sulphate and carbonate. Most of the output of barytes in California, at present, is being utilized in the manufacture of lithopone.

The principal uses for barytes after washing and grinding, are as an inert pigment and filler in paint, paper, linoleum, oilcloth and rubber manufacture, and in the preparation of lithopone and a number of chemicals. The most important of such chemicals, other than lithopone, are: barium binoxide (used in preparation of hydrogen peroxide); barium carbonate (used by pressed brick and by rubber manufacturers to neutralize sulphur content); barium chloride (used in battery plates, and as a mordant by dry-color manufacturers, and in tanning leather); barium nitrate (used in munitions and in making 'red fire' material); barium sulphate precipitated, or 'blanc fixe' (used in rubber manufacture; for painting on interior steel of battle-ships and other sea-going vessels; also as a detector in taking X-ray pictures of the human body).

More than half of the total tonnage of barytes utilized in the United States is taken in the manufacture of lithopone. This is a chemically-prepared, white pigment containing about 70% barium sulphate and 30% zinc sulphide, and is one of the principal constituents of 'flat' wall paints now so extensively used in office buildings and hospitals, replacing both paper and calcimine wall finishes. Present quotations for barytes vary from \$5 to \$9 per ton, crude, f. o. b. rail-shipping point, depending on quality. Most barite has to be washed and acid-treated to remove iron stains or other impurities before being suitable for paint use.

Known occurrences of this mineral in California are located in Inyo, Los Angeles, Mariposa, Monterey, Nevada, San Bernardino, Shasta and Santa Barbara counties. The deposit at El Portal, in Mariposa County, has given the largest commercial production to date, in part witherite (barium carbonate, BaCO_3). The 1915 output was the first commercial production of the carbonate in the United States of which we have record. In 1916-1920, some tonnage of barytes came from a deposit opened up on Fremont's Peak, Monterey County, near the line of San Benito County; in 1919-1922, shipments were made from Nevada County. Shasta County is in the list for 1921-1922.

The first recorded production of barytes in California, according to the statistical reports of the State Mining Bureau, was in 1910. The annual figures are as follows:

| Year | Tons | Value | Year | Tons | Value |
|------------|-------|---------|--------------|--------|-----------|
| 1910 ----- | 860 | \$5,640 | 1918 ----- | 100 | \$1,500 |
| 1911 ----- | 309 | 2,207 | 1919 ----- | 1,501 | 18,065 |
| 1912 ----- | 564 | 2,812 | 1920 ----- | 3,029 | 20,795 |
| 1913 ----- | 1,600 | 3,680 | 1921 ----- | 901 | 4,809 |
| 1914 ----- | 2,000 | 3,000 | 1922 ----- | 3,370 | 18,925 |
| 1915 ----- | 410 | 620 | | | |
| 1916 ----- | 1,606 | 5,516 | Totals ----- | 20,670 | \$113,202 |
| 1917 ----- | 4,420 | 25,633 | | | |

BISMUTH.

Bibliography: Bulletins 38, 67. Am. Jour. Sci. 1903, Vol. 16.

Several bismuth minerals have been found in California, notably native bismuth and bismite (the ochre) in the tourmaline gem district in San Diego and Riverside counties near Pala. Other occurrences of bismuth minerals, including the sulphide, bismuthinite, have been noted in Inyo, Fresno, Nevada, Tuolumne, and Mono counties, but only in small quantities. The only commercial production recorded was 20 tons valued at \$2,400, in 1904, and credited to Riverside County.

In 1917, a few pounds of bismuthinite (Bi_2S_3) with associated bismutite ($\text{Bi}_2\text{CO}_3 \cdot \text{H}_2\text{O}$), was taken out at the United Tungsten Copper mine, in the Morongo district, San Bernardino County. It is associated with scheelite in a contact deposit between limestone and granite.

Recovery of bismuth from blister copper in the electrolytic refinery has been noted,¹ ranging as high as 27.3 pounds of metallic bismuth per 100 tons of blister copper from the Iron Mountain, Shasta County, ores. In the United States, the principal recovery of bismuth is obtained as a by-product from the refining of lead bullion.

The uses of bismuth are somewhat restricted, being employed principally in the preparation of medicinal salts, and in low melting-point or cliché alloys. These alloys are utilized in automatic fire sprinkler systems, in electrical fuses, and in solders.

Present quotations for bismuth are \$2.55 per pound for the refined metal.

CADMIUM.

Bibliography: U. S. G. S., Min. Res. of U. S., 1908, 1918.

During 1917 and 1918, cadmium metal was recovered by the electrolytic zinc plant of the Mammoth Copper Company in Shasta County. It was shipped in the form of 'sticks' and amounted to a total of several thousand pounds for the two years, the exact figures being concealed under 'Unapportioned.' That was the first, and thus far the only, commercial production of cadmium recorded from California ore. Cadmium there occurs associated with zinc sulphide, sphalerite, probably as the sulphide, greenockite. Cadmium also occurs in the Cerro Gordo Mine, Inyo County, associated with smithsonite (zinc carbonate).

There are several cadmium minerals, but none of them occur in sufficient quantities individually to be profitable as distinct ores. The cadmium of commerce is derived as a by-product in the reduction of

¹Trans. Am. Inst. Min. Eng., Vol. 47, pp. 217-218.

zinc minerals and ores, in nearly all of which it occurs in at least minute proportions, the average ratio being about 1 of cadmium to 200 of zinc. As cadmium behaves metallurgically much the same as zinc, it constitutes a fraction of 1 per cent of nearly all metallic zinc.

Cadmium is produced in United States in two forms—metallic cadmium and the pigment, cadmium sulphide. The principal use of the metal is in low-melting point, or cliché alloys, and its salts are utilized in the arts, medicine, and in electroplating. The sulphide is employed as a paint pigment, being a strong yellow, which is unaffected by hydrogen sulphide gas from coal smoke. It is also employed in coloring glass and porcelain. Cadmium cliché metal is stated to be superior to the corresponding bismuth alloy, for making stereotype plates. Cadmium is also used in bronze telegraph and telephone wires, and gives some promise of being utilized in electroplating.

Present quotations for cadmium are \$1.15 per pound for the refined metal.

COBALT.

Bibliography: Report XIV: Bulletin 67. U. S. G. S., Min. Res. of U. S., 1912, 1918.

Occurrences of some of the cobalt minerals have been noted in several localities in California, but to date no commercial deposits have been developed. Some of the copper ores of the foothill copper belt in Mariposa and Madera counties have been found to contain cobalt up to 3%.

The most important use of cobalt is in the manufacture of the alloy, stellite, in which it is combined with chromium, for making high-speed lathe tools, and non-tarnishing cutlery and surgeons' appliances. The metal is also used in electroplating, similarly to nickel; and the oxide, carbonate, chloride, sulphate and other salts are used in ceramics for coloring. Some of the organic salts of cobalt (acetate, resinate, oleate) are employed as 'driers' in paint and varnish.

Present quotations for cobalt are \$2.65–\$2.85 per pound for the refined metal.

GRAPHITE.

Bibliography: State Mineralogist Reports XIII, XIV, XV, XVII. Bulletin 67. U. S. G. S., Min. Res., 1914, Pt. II.

Graphite has been produced from time to time in the State, coming principally from Sonoma and Los Angeles counties. It is difficult for these deposits, which must be concentrated, to compete with foreign supplies, which go on the market almost directly as they come from the deposit. Graphite ores are concentrated with considerable difficulty, and the electric process of manufacturing artificial graphite from coal has been perfected to such a degree that only deposits of natural graphite of a superior quality can be exploited with any certainty of success.

According to the U. S. Geological Survey, operators in this country who are working disseminated flake deposits must depend on their No. 1 and 2 flake for their profit. Graphite dust is merely a by-product and is salable only at a low price. Improved methods of graphite milling adopted promise to increase largely the production of flake of better grade.

The principal value of graphite is on account of its infusibility and resistance to the action of molten metals. It is also largely used in the manufacture of electrical appliances, of 'lead' pencils, as a lubricant, as stove polish, paints, and in many other ways. Amorphous graphite, commonly carrying many impurities, brings a much lower price. For some purposes, such as foundry facings, etc., the low-grade material is satisfactory. Among the newer uses for graphite is the prevention of formation of scale in boilers. The action is a mechanical one. Being soft and slippery, the graphite prevents the particles of scale from adhering to one another or to the boiler and they are thus easily removed.

The price increases with the grade of material, the best quality crystalline variety being quoted at present at 6¢-6½¢ per pound (Ceylon lumps); with American flake at 4¢-5¢ per pound f.o.b. mine.

The coarser flakes are necessary for crucibles, as they help to bind the clay together in addition to their refractory service. Since the close of hostilities in Europe, prices have declined to pre-war levels; and imports have been resumed from Ceylon, Canada, Madagascar, Mexico and Korea, of a total of 7496 tons valued at \$452,076 in 1921.

Occurrence of graphite has been reported at various times from Calaveras, Fresno, Imperial, Los Angeles, Mendocino, San Bernardino, San Diego, Siskiyou, Sonoma and Tuolumne counties.

During 1922 an increased production was reported from Los Angeles County. It was concentrated from a disseminated ore, and was used for paint and foundry facing. As there was but a single operator, the figures are concealed under the 'Unapportioned' item. The production, by years, has been as follows:

| Year | Pounds | Value |
|--------|-----------|----------|
| 1901 | 128,000 | \$4,480 |
| 1902 | 84,000 | 1,680 |
| 1903 | | |
| 1913 | 2,500 | 25 |
| 1914 | | |
| 1915 | | |
| 1916 | 29,190 | 2,335 |
| 1917 | | |
| 1918 | *770,000 | 37,225 |
| 1919 | | |
| 1920 | | |
| 1921 | *624,000 | 26,160 |
| 1922 | | |
| Totals | 1,637,690 | \$71,905 |

*Annual details concealed under 'Unapportioned,' on account of a single producer.

INFUSORIAL AND DIATOMACEOUS EARTHS.

Bibliography: State Mineralogist Reports II, XII, XIII, XIV, XV, XVII, XVIII. Bulletins 38, 67. Am. Inst. Min. Eng., Bull. 104, August, 1915, pp. 1539-1550. U. S. Bur. of Mines, Rep. of Investigations: Serial No. 2431, Jan., 1923.

Infusorial and diatomaceous earths—sometimes called tripolite—are very light and extremely porous, chalk-like materials composed of pure silica (chalk, being calcareous) which have been laid down under water and consist of the remains of microscopical infusoria and diatoms.

The former are animal remains, and the latter are from plants. The principal commercial use of this material is as an absorbent. It is also employed in the manufacture of scouring soap and polishing powders; for filtration purposes; in making some classes of refractory brick; and as an insulating medium both in heating and refrigeration. It is a first-class nonconductor of heat, where high temperatures are employed, such as around steel and gas plants and power houses. In such cases, it is built in as an insulating layer in furnace walls. In Germany, under the name 'kieselguhr,' it was used as an absorbent for nitroglycerine in the early manufacture of dynamite.

As a nonconductor of heat it has been used alone or with other materials as a covering for boilers, steam pipes, and safes and in fireproof cements. It is used largely by paint manufacturers as a wood filler. Boiled with shellac it is made into records for talking machines. It has been used for absorbing liquid manures so that they could be utilized as fertilizers, and as a source of silica in making water-glass as well as in the manufacture of cement, tile glazing, artificial stone, ultra-marine and other pigments of aniline and alizarine colors, paper filling, sealing wax, fireworks, hard-rubber objects, matches, and papier maché, and for solidifying bromine. For making insulating brick the material is sawed into blocks, and for all other purposes it is ground and screened.

The most important deposits in California thus far known are located in Monterey, Orange, San Luis Obispo, and Santa Barbara counties. The Santa Barbara material is diatomaceous and is of a superior quality. Infusorial earth is also found in Fresno, Kern, Los Angeles, Plumas, San Benito, San Bernardino, San Joaquin, Shasta, Sonoma, and Tehama counties.

The following description of the deposit and plant of the Celite Products Company at Lompoc, Santa Barbara County, is quoted from a recent paper published by the U. S. Bureau of mines:¹

"The character of the material varies in different parts of the bed and only selected parts where the overburden is light, are quarried. Also, certain parts of the bed are used for specific purposes. After cleaning off the overburden, the diatomaceous earth is quarried by means of a channeling machine developed by the company. Cuts are made across the face 4 feet deep and 4 feet apart. The largest part of the production is used for insulating brick, which are sawed on the ground from the blocks cut by the channeling machines. The machine used for sawing the brick was also developed by the company. The material desired for grinding is quarried, after channeling, by pick and shovel and loaded by hand into horse-drawn wagons and then hauled to a drying yard. The brick are hauled to a drying yard in light tram cars. After sun-drying, the brick are hauled to the railroad, and the other product to the mill in motor trucks.

"At the mill, the sun-dried diatomaceous earth is fed by hand into an impact pulverizer, which is moved along the bottom of the storage bin. The pulverized material is drawn through galvanized iron tubing by an exhaust fan to the main building where it is packed for shipment in bags. The unbroken single diatoms are desired for filtering and some other uses. The dust, consisting of the finer particles and broken diatoms, which does not settle in the bins of the main building, is drawn into a bag house where it is filtered out of the air. This material is used for polishes and other similar purposes. All crushing is done dry.

"The Kieselguhr is nearly pure silica and has the capacity of absorbing several times its weight of liquids. Dr. Herbert Insley, petrologist, U. S. Bureau of Mines, examined some of the samples under the microscope and made the following report:

"This material is very light in weight due in part to its great porosity. Under the microscope, the material was found to be made up almost wholly of the tests or skeletons of diatoms. These tests are composed of practically pure silica. The silica is evidently amorphous for there is no evidence of double refraction between crossed nicols. Most of the skeletons were unbroken. Complete skeletons more than three-tenths of a millimeter in greatest dimension were not observed, although some of the skeletons of which fragments were observed must have been at least seven-tenths of a millimeter in length. Disk-like diatoms containing hexagonal perforations or depressions and long, slender spine-like diatoms are very common."

"Photomicrographs made by Dr. Insley show considerable fine dust and many sharp-edged particles.

"The deposit is damp when first exposed, but during the summer months, the air is very dry and the wind blows almost continuously, hence the surface is soon dried. Since the kieselguhr is very light, the dust is easily picked up by the wind."

¹Gardner, E. D., Mining diatomaceous earth at Lompoc, California: U. S. B. of M., Reports of Investigations Serial No. 2431, Jan. 1923.

As over 95 per cent of the output in California is from a single operator, we have concealed the exact figures under the 'Unapportioned' item in the state and county totals. There were three operators in 1922 in San Luis Obispo and Santa Barbara counties.

Total Production of Diatomaceous Earth in California.

The first recorded production of these materials in California occurred in 1889; total amount and value of output, to date, are as follows:

| Year | Tons | Value | Year | Tons | Value |
|------|-------|---------|--------|---------|-------------|
| 1889 | 39 | \$1,535 | 1907 | 2,531 | \$28,948 |
| 1890 | | | 1908 | 2,950 | 32,012 |
| 1891 | | | 1909 | 500 | 3,500 |
| 1892 | | | 1910 | 1,843 | 17,617 |
| 1893 | 50 | 2,000 | 1911 | 2,194 | 19,670 |
| 1894 | 51 | 2,040 | 1912 | 4,129 | 17,674 |
| 1895 | | | 1913 | 8,645 | 35,968 |
| 1896 | | | 1914 | 12,840 | 80,350 |
| 1897 | 5 | 200 | 1915 | 12,400 | 62,600 |
| 1898 | | | 1916 | 15,322 | 80,649 |
| 1899 | | | 1917 | 24,301 | 127,510 |
| 1900 | | | 1918 | 35,963 | 189,459 |

LITHIA.

Bibliography: State Mineralogist Reports II, IV, XIV. Bulletins 38, 67.

Lithia mica, lepidolite (a silicate of lithium et al.) utilized in the manufacture of artificial mineral water, fireworks, glass, etc., has been mined in San Diego County since 1899, except between 1905 and 1915. Some amblygonite, a lithium phosphate, has also been obtained from pockets associated with the gem tourmalines. In 1922 there was a slight drop in the yield of lepidolite, the output being utilized in glass manufacture. As there was only a single producer, the figures are concealed under the 'unapportioned' item. The average value reported was \$15.30 per ton, f.o.b. rail-shipping point.

Lithia mica total production in the state has been as follows:

| Year | Tons | Value | Year | Tons | Value |
|------|-------|---------|--------|--------|-----------|
| 1899 | 124 | \$4,600 | 1916 | 71 | \$1,065 |
| 1900 | 440 | 11,000 | 1917 | 880 | 8,800 |
| 1901 | 1,100 | 27,500 | 1918 | 4,111 | 73,998 |

| 1905 | 25 | 276 | 1922 | | |
| 1906 | | | | | |
| 1915 | 91 | 1,365 | Totals | 21,216 | \$401,467 |

*Annual details concealed under 'Unapportioned.'

According to the U. S. Geological Survey, the only other production of lithium minerals in the United States outside of California in recent years has been spodumene from South Dakota.

MAGNESITE.

Bibliography: State Mineralogist Reports XII, XIII, XIV, XV, XVII; Bulletin 38, U. S. G. S., Bulletins 355, 540; Min. Res. 1913, Pt. II, pp. 450-453. Min. & Sci. Press, Vol. 114, p. 237, "Magnesite"—Hearings before the Comm. on Ways and Means, House of Repr., on H. R. 5218, June 16, 17 and July 17, 1919. Eng. Soc. W. Penn., Proc. 1913, Vol. 29, pp. 305-388, 418-444. Eng. & Min. Jour.-Press, Vol. 114, July 29, and Dec. 2, 1922.

Occurrence.

Magnesite is a natural carbonate of magnesium, and when pure contains 52.4% CO_2 (carbon dioxide) and 47.6% MgO (magnesia). It has a hardness of 3.5 to 4.5, and specific gravity of 3 to 3.12. It is both harder and heavier than calcite (calcium carbonate), and also contains a higher percentage of CO_2 , as calcite has but 44%.

Most of the California magnesite is comparatively pure, and is ordinarily a beautiful, white, fine-grained rock with a conchoidal fracture resembling a break in porcelain. The Grecian magnesite is largely of this character; while the Austrian varieties usually contain iron, so that they become brown after calcining. The Washington magnesite resembles dolomite and some crystalline limestones in physical appearance. Its color varies through light to dark gray, and pink.

In California the known deposits are mostly in the metamorphic rocks of the Coast Ranges and Sierra Nevada Mountains, being associated with serpentine areas. The notable exceptions are the sedimentary deposits, at Bissell in Kern County and at Afton in San Bernardino County. Several thousand tons have been shipped from the Bissell deposit; and small shipments have been made from the Afton property.

The Washington deposits are associated with extensive strata of dolomitic limestone. The magnesite there appears to contain more iron than most of the California mineral, which makes it desirable for the steel operators. However, recent experience has proven that several California localities have sufficient iron in their magnesite to be serviceable in the steel furnaces. This is particularly true of the Refractory Magnesite Company's mine near Preston in Sonoma County, and the White Rock Mine at Pope Valley, Napa County.

Uses.

The principal uses include: Refractory linings for basic open-hearth steel furnaces, copper reverberatories and converters, bullion and other metallurgical furnaces; in the manufacture of paper from wood pulp; and in structural work, for exterior stucco, for flooring, wainscoting, tiling, sanitary kitchen and hospital finishing, etc. In connection with building work it has proven particularly efficient as a flooring for steel railroad coaches, on account of having greater elasticity and resilience than 'Portland' cement. For refractory purposes the magnesite is 'dead burned'—i. e., all or practically all of the CO_2 is expelled from it. For cement purposes it is left 'caustic'—i. e., from 2% to 10% of CO_2 is retained. When dry caustic magnesite is mixed with a solution of

magnesium chloride ($MgCl_2$) in proper proportions, a very strong cement is produced, known as oxychloride or Sorel cement. It is applied in a plastic form, which sets in a few hours as a tough, seamless surface. It has also a very strong bonding power, and will hold firmly to wood, metal, or concrete as a base. It may be finished with a very smooth, even surface, which will take a good wax or oil polish. As ordinarily mixed there is added a certain proportion of wood flour, cork, asbestos, or other filler, thereby adding to the elastic properties of the finished product. Its surface is described as 'warm' and 'quiet' as a result of the elastic and nonconducting character of the composite material. The cement is frequently colored by the addition of some mineral pigment to the materials before mixing as cement.

The desirable qualities of any flooring material (cost not considered) are listed for purposes of analysis or comparison under eighteen heads, as follows: Cleanliness (sanitary qualities), quietness, immunity from abrasion (surface wear), resilience, immunity from slipperiness, appearance, waterproof character, plasticity, warmth (thermal insulation), life (immunity from deterioration with age), acid-proof character, alkali-proof character, fire resistance, elasticity, crushing strength, structural strength (rupture), immunity from expansion and contraction, and lightness. The importance of these several qualities varies with the varying requirements to be met; for instance, in some places, as in hospitals, cleanliness is one of the prime considerations; in other places immunity from abrasion might be one of the principal requisites. As to most of these qualities the conclusion is reached that the magnesia cement affords one of the most satisfactory flooring materials for many purposes, such as in kitchen, laundry, toilet and bathrooms, corridors, large rooms or halls in public or other buildings, including hospitals, factories, shops and restaurants.

There is no doubt that the material is steadily coming into more general recognition and favor for these uses. For a few special uses it is more or less disqualified: as an instance, it is not suited for construction of swimming tanks or for conditions of permanent wetness, since under constant immersion it gradually softens, although it is said to withstand intermittent wetting and drying and is recommended for shower baths. Naturally it is not acid-proof and not wholly alkali-proof, which might be a disadvantage in use for laboratory floors and tables; but these are rather special requirements. Its cost per square foot is given (in 1913) as 25 to 33 cents, depending on area, which is estimated, to be lower than marble, cork, rubber, clay or mosaic tile, slate or terrazzo, although more expensive than wood, asphalt, linoleum or Portland cement.

In the discussion of the subject (see Bibliography) the causes of failure are ascribed to uncertain climatic changes, lack of uniformity in the mixtures used, lack of care on the part of those handling the materials, possible deterioration of materials used through exposure (either before or after mixing), lack of proper preparation of foundations on which the material is to be laid, and, as a very important factor, experience or nonexperience in the manipulation or actual laying and troweling of the material. Data concerning the percentages of magnesium chloride and of ground calcined magnesia and data concerning the character and quantity of filler and color added to the commercial preparations are naturally guarded as trade secrets by the firms already in the

business. The examination and standardization of the raw materials used, and of acceptable filler materials, and the establishment of standard proportions for the mixtures would seem to be about the only satisfactory way of attacking the problem.

The condition of the calcination of magnesite for cement uses is important, as the same material may undoubtedly be greatly varied in its reacting properties by differing treatment in the kiln. It is generally agreed that the magnesite for cement use must be comparatively free from lime, as lime has a greater tendency to reabsorb water and carbon dioxide than the magnesia, thereby causing swelling, and is therefore not so permanent in the completed cement as a pure magnesia material. The fillers used may constitute 10% to 40% of the whole cement, and commonly consist of ground marble, sand, sawdust, cork, asbestos or other materials. As an example of the formulas used in mixing such cements the following are quoted:¹

Mixtures for the underlying or coarser layer.

[Parts by weight.]

1. 15 parts magnesia.
10 parts magnesium chloride solution, 20° Baumé.
10 parts moist sawdust.
(Sets in 36 hours.)
2. 10 parts magnesia.
10 parts magnesium chloride solution, 28° Baumé.
5 parts sawdust.
(Sets in 16 hours.)
3. 20 parts magnesia.
15 parts magnesium chloride solution, 20° Baumé.
4 parts ground cork.
(Sets in 24 hours.)
4. 5 parts magnesia.
3 parts magnesium chloride solution, 20° Baumé.
5 parts ashes.
(Sets in 24 hours.)

Mixtures for overlying or surface layers.

[Parts by weight.]

1. 40 parts magnesia.
33 parts magnesium chloride solution, 19° Baumé.
10 parts asbestos powder.
5 parts wood flour.
1 part red ochre.
(Sets in 24 hours.)
2. 25 parts magnesia.
25 parts magnesium chloride, 21° Baumé.
4½ parts wood flour, impregnated with 4½ parts Terpentinharzlösung.
15 parts yellow ochre.
(Sets in 30 hours.)

The magnesite used is the fine-ground calcined (not dead-burned) of certain specified kinds or place of derivation regularly sold for plastic purposes. This material commonly comes in paper-lined casks, barrels or boxes, in which form it is fairly permanent, but it deteriorates by exposure, absorbing carbonic acid and moisture from the air. If

¹Scherer, Robert—Der Magnesit, sein Vorkommen, seine Gewinnung und technische Verwertung, pp. 216-217, A. Hartleben's Bibliothek; Wien und Leipzig, 1908.

carefully handled it can probably be kept unopened a year or more, but it should be used within a few weeks after being opened, even under most favorable conditions.

The use of magnesia cement has been suggested as a protecting coating for mine timbers, particularly against the fire hazard. The necessary qualities for any substance for such purpose have been summarized as follows: It should be resistant to abrasion, and to impact and structural stresses. It should be durable when subjected to the action of the elements, and stable to any minor derangements of the base on which it is placed. It must be relatively unaffected by changes in temperature, by the action of water, and should adhere to the material on which it is placed, and it should also be free from shrinkage cracks due to setting up the material, and have the ability to resist fire. Magnesite cement appears to fulfill the various conditions thus outlined.

It is stated that some metallic magnesium has been prepared electrolytically at Niagara Falls from magnesite.

For refractory purposes the calcined magnesite is largely made up into bricks, similar to fire-brick for furnace linings. It is also used un-consolidated, as 'grain' magnesite. For such, an iron content is desirable, as it allows of a slight sintering in forming the brick. Dead-burned, pure, magnesia can not be sintered except at very high temperatures; and it has little or no plasticity, so that it is hard to handle. Its plasticity is said to be improved by using with it some partly calcined or caustic magnesite. Heavy pressure will bind the material sufficiently to allow it to be sintered.

A coating of crushed magnesite is laid on hearths used for heating steel stock for rolling, to prevent the scale formed from attacking the fire-brick of the hearth.

Imports and Domestic Production.

Reports of the U. S. Bureau of Foreign and Domestic Commerce show imports of calcined magnesite to have been 172,591 long tons in 1913; 144,747 in 1914, and 63,347 in 1915; most of it coming from Austria-Hungary and some from Greece. For the same years the production of crude (from 2 to $2\frac{1}{2}$ tons of crude ore required to yield one ton of the calcined) magnesite in California (the sole producer of those years, in the United States) was: 9632 short tons, 11,438 tons, 30,721 tons, respectively. For 1916 the California output leaped to 154,052 tons of crude and to 209,648 tons in 1917, but has dropped considerably since then on account of resumption of foreign importations, which totaled 52,483 long tons in 1921, valued at \$776,384, being then admitted duty free. Shipments from Washington were begun late in 1916; and during the following three years assumed important proportions, but only a small tonnage was shipped in 1922.

The Tariff Act of 1922, which became effective September 22nd, last year, placed the following import duties on magnesite: Crude magnesite, $\frac{5}{16}\phi$ per lb.; caustic-calcined magnesite $\frac{5}{8}\phi$ per lb.; dead-burned and grain magnesite, not suitable for manufacture into oxychloride cements, $\frac{23}{40}\phi$ per lb.; magnesite brick, $\frac{3}{4}\phi$ per lb. and 10% ad valorem. The figures of imports for 1922 after that date have not yet been published

by the U. S. Bureau of Foreign and Domestic Commerce, but for the nearly 10 months up to that time, the total was 112,159 long tons valued at \$1,757,636, as compared with the figures shown in the preceding paragraph.

Output and Value.

In considering mineral production, the value of the crude material is used as far as practicable. Magnesite presents a peculiar example of a material which previous to 1916 was seldom handled on the market in the crude state. It is mainly calcined and ground before being considered marketable. From 2 to $2\frac{1}{2}$ tons of crude material are mined to make one ton of the calcined. In the earlier reports an arbitrary value for the crude material at the mine was calculated from the above on the basis of the calcined value, there having been very little product shipped crude. On the contrary, however, considerable tonnages since 1916 have been shipped in the crude state, contracted for at prices ranging from \$7 to \$17 per ton, f. o. b. rail points. The average was \$10.50 per ton, for 1922. This is the basis of the valuation used herein.

The production of crude magnesite in California during the year 1922 totaled 55,637 tons, valued at \$594,665 f. o. b. rail-shipping point. This is an increase over the 47,837 tons and \$511,102 in 1921.

The main hope for the future for California magnesite appears to be in the development of the plastic business, particularly in the territory west of the Rocky Mountains; and in the manufacture of refractory brick to be utilized mainly by the copper and lead smelters in the same district. It is possible that California magnesite may be sent via the Panama canal to the Atlantic seaboard; but, on account of our higher production costs, it is difficult to see how we can compete with the Grecian article at Atlantic ports.

Several plants are reported making refractory brick here from California magnesite. The ore from the White Rock Mine in Napa County, and that from the old Kolling (Refractory Magnesite Company) Mine, Sonoma County, is a natural ferro-magnesite and has found a ready market for refractory purposes.

In 1918, for the first time since Tulare County became an important producer of this mineral, it was surpassed in tonnage output for the year, but regained the lead in 1919, followed by Santa Clara and Napa counties, respectively. The same ranking was retained in 1920; but Santa Clara took the lead in 1921. The largest individual producer in 1920-1922 has been the Western Magnesite Development Co., in Santa Clara County, operated under lease by C. S. Maltby. A total of 24,091 tons was reported as shipped calcined by Californian mines in 1922, representing approximately 52,205 tons of crude ore.

Owing to increased building operations, and the duty on foreign importations, the outlook for magnesite is improving. Research work is being conducted by the larger operators to insure uniformity of product, and to work out formulae and mixtures for its application in the plastic trade. Present quotations (March) are reported at \$14 per ton crude, f. o. b. California points, and \$40 per ton calcined.

Production of crude magnesite for 1922, by counties, is given in the following table, with total crude value:

| County | Tons | Value |
|--|--------|-----------|
| Santa Clara ----- | 28,650 | \$301,875 |
| Stanislaus ----- | 2,400 | 35,475 |
| Tulare ----- | 17,223 | 181,842 |
| Fresno, Napa, San Benito, Tuolumne*----- | 7,364 | 75,473 |
| Totals----- | 55,637 | \$594,665 |

*Combined to conceal output of a single operator in each.

Total Magnesite Production of California.

The first commercial production of magnesite in California was made in the latter part of 1886 from the Cedar Mountain district,¹ southeast of Livermore, Alameda County. Shipments amounting to 'several tons' or 'several carloads' were sent by rail to New York; but there is apparently no exact record of the amount for that first year. The statistical records of the State Mining Bureau began with the year 1887, and the table herewith shows the figures for amount and value, annually, from that time. Shipments of magnesite from Napa County began in 1891 from the Snowflake Mine; from the Red Mountain deposits in Santa Clara County, in 1899; and from Tulare County in 1900.

Production of Magnesite in California, Since 1887.

| Year | Tons | Value | Year | Tons | Value |
|------------|-------|---------|-------------|---------|-------------|
| 1887 ----- | 600 | \$9,000 | 1906 ----- | 4,032 | \$40,320 |
| 1888 ----- | 600 | 9,000 | 1907 ----- | 6,405 | 57,720 |

MICA.

Bibliography: State Mineralogist Reports II, IV. Bulletins 38, 67.

No commercial production of mica has recently been reported in California. Production in previous years has been as follows:

| Year | Tons | Value |
|--------|------|---------|
| 1902 | 50 | \$2,500 |
| 1903 | 50 | 3,800 |
| 1904 | 50 | 3,000 |
| Totals | 150 | \$9,300 |

"The different uses to which mica is put depend on its form—whether in sheets or in powder. Sheet mica is used in the electrical industry for glazing, and to some extent for other purposes. Ground mica is used chiefly in the decorative trades and in insulation.

"Sheet mica finds its greatest use in the electrical industry, where an insulating, noninflammable material is necessary. It is used in sheets and as washers and disks in dynamo-electric machinery, electric-light sockets, spark plugs, insulators, guards in rheostats, fuse boxes, and telephones. Flexible cloth and tape, covered with mica, find varied uses in electrical apparatus. Sheet mica is used for glazing the fronts of stoves and for making lamp chimneys and lamp shades. It is also used in spectacles, automobile shields, phonograph diaphragms, in windows where glass would be broken and in lantern transparencies.

"Ground mica is used for decoration in wall paper, to which it gives luster and brightness; in fancy paints, ornamental tiles, concrete, rubber goods, pipe and boiler coverings, insulating compounds, fireproof paints and coverings, patent roofing material, molded mica (ground mica mixed with shellac), and calico printing; as absorbent for nitroglycerin in the manufacture of 'mica powder,' in tempering steel; to a large extent as a lubricant for wooden bearings, or, mixed with oil, as a lubricant for metal bearings; and as a filler for various products. Tar and other roofing papers are coated with coarsely ground mica to prevent sticking when they are rolled for shipment. A possible value of ground mica as a chemical source of potash salts is indicated in a recent Geological survey report.²

"It is understood that sheet mica has come to be of importance as a war mineral through its use abroad as windows in masks worn for defense against asphyxiating gases, and for other uses where a transparent, noninflammable, nonshattering material is necessary, as in automobile goggles and in windows for armored cars."

Present New York quotations for No. 1 quality sheet mica are from 15c per lb. for 1½x2 inch to \$3.60 per lb. for 6x6 inch, f. o. b. North Carolina, thumb trimmed; punch 8c, other grades, 25c to \$3.25 according to size; flake 12c per lb.; scrap \$25 per ton; f. o. b. Virginia points.

MOLYBDENUM.

Bibliography: Reports XIV, XVII. Bulletin 67. U. S. Bur. of Min., Bulletin 111. Proc. Colo. Sci. Soc., Vol. XI.

Molybdenum is used as an alloy constituent in the steel industry, and in certain forms of electrical apparatus. Included in the latter, is its successful substitution for platinum and platinum-iridium in electric contact-making and breaking devices. In alloys it is used similarly to and in conjunction with chromium, cobalt, iron, manganese, nickel, tungsten, and vanadium. The oxides and the ammonium salt have important chemical uses.

The two principal molybdenum minerals are: the sulphide, molybdenite; and wulfenite, lead molybdate; the former furnishing practically the entire commercial output. Molybdenite is found in or associated with acidic igneous rocks, such as granite and pegmatite. The chief commercial sources have been New South Wales, Queensland, and Norway, with some also from Canada.

¹Schaller, W. T., Mica in 1916; U. S. Geol. Surv., Min. Res. of U. S. 1916, p. 304, 1917.

²Butler, B. S., Potash in certain copper and gold ores, with a note on muscovite by George Steiger; U. S. Geol. Survey Bull. 620, pp. 227-235, 1916.

Deposits of disseminated molybdenite are known in several localities in California, and in at least two places it occurs in small masses associated with copper sulphides. The only recorded commercial shipments of molybdenum ore in California were during the war, 1916-1918. Some development work has recently been done on a high-grade deposit at the head of the Kaweah River, Tulare County.

The 1917 output included some concentrates assaying up to 58% MoS_2 , but the bulk of it was 1.5% ore which was shipped to Denver, Colorado, for concentration. That production came mainly from Shasta County, with smaller amounts from Inyo, Mono and San Diego counties. There were two concentrating plants built in California—one in each of the above first and last-named counties.

In the spring of 1918, a flotation plant operated for a short time by a lessee on the Boulder Creek mine, near Gibson Siding, Shasta County, made a small amount of 90% MoS_2 concentrate. The ore treated carried 2.6% MoS_2 . There has been none produced in California since 1918.

Present quotations for molybdenum ore are @ 65¢ per pound for 85% MoS_2 concentrates, plus duty.

The California production of molybdenum ore by years is summarized in the following tabulation:

| Year | Tons | Value |
|--------|------|----------|
| 1916 | 8 | \$9,945 |
| 1917 | 243 | 9,014 |
| 1918 | * | 300 |
| Totals | 251 | \$19,259 |

*300 pounds of 90% MoS_2 concentrate.

NICKEL.

Bibliography: Reports XIV, XVII. U. S. G. S., Bulletin 640-D.

Nickel occurs in the Friday Copper Mine in the Julian District, San Diego County. The ore is a nickel-bearing pyrrhotite, with some associated chalcopyrite. Some ore has been mined in the course of development work, but not treated nor disposed of, as they were unable to get any smelter to handle it for them. Nickel ore has also been reported from other localities in California, but not yet confirmed.

Present quotations for nickel are 25¢-30¢ per pound, according to grade and quantity.

MUSEUM.

The Museum of the State Mining Bureau possesses an exceptionally fine collection of rocks and minerals of both economic and academic value. It ranks among the first five of such collections located in North America; and contains not only one or more samples of most of the known minerals found in California, but many specimens from other states and foreign countries as well.

Mineral specimens suitable for exhibit purposes are solicited, and their donation will be appreciated by the State Mining Bureau as well as by those who utilize the facilities of the collection. The Bureau supplies a set of forty typical minerals and ores, appropriately labeled, for study purposes to any public school in the state upon

request. During the past 30 days, a total of 431 visitors signed their names to the Museum register, and in addition there are many others daily who fail to take note of our request for their signatures.

LABORATORY.

FRANK SANBORN, Mineral Technologist.

A total of 273 samples was received and determined during the thirty-day period covered by this report. From this number is appended a list having a possible commercial value, judging only from the samples submitted. The name and address of the sender of any of these samples will be sent upon request if the reference number is given.

The eagerly active and partly successful attempts to exterminate the boll weevil in the cotton belts has resulted in many requests being made for the determination of arsenic, phosphates and potassium. The former is being used in preparing calcium arsenic to be used as an insecticide and the latter two in the making of fertilizers for use in the cotton fields.

- 15-32 Marble (variegated).
- 15-33 Quartz.
- 15-34 Arsenopyrite.
- 15-35 Witherite (barium carbonate).
- 15-36 Sericite-schist.
- 15-37 Cobaltite (sulph-arsenide of cobalt).
- 15-38 Rutile (titanium oxide).
- 15-39 Allanite (contains didymium, yttrium, cerium, etc.).
- 15-40 Sericite-schist; also opal.
- 15-41 Amphibole asbestos.
- 15-42 Sodium sulphate.

LIBRARY.

E. COONEY, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received during the month, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the State are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

 Western Sentinel, Etna Mills, Cal.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of consumers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them have been made known to those looking for raw mineral products.

Sufficient publicity has not heretofore been given to this feature of the Bureau's work, but in 'Mining in California' a suitable medium is provided for current inquiries of this nature, and, therefore, written or verbal inquiries that come to the attention of the Bureau are summarized in each issue.

The name of the product wanted or offered, only, is published; the name of the owner of the deposit, or buyer, and other details being supplied upon request.

In writing, the reference number of the item should be given.

Mineral Products or Deposits for Sale.

- 12-24 Raw magnesite.
- 12-25 Shale oil for flotation purposes.
- 12-26 Barite; large deposit $1\frac{1}{2}$ miles from railroad.
- 12-27 Diatomaceous earth.
- 12-28 Quartz crystals.
- 12-29 Sericite-schist.
- 12-30 Graphite.
- 12-31 Copper-gold-silver claims; Inyo County.
- 12-32 Quicksilver claims; undeveloped; 80 acres.
- 12-33 Gold quartz prospect; $\frac{1}{2}$ mile east of Kennedy mine; 90-ft. shaft.
Liberal lease and option.
- 12-34 Red marble deposit; on good road eight miles from railroad.
- 12-35 White clay and white clay-sand; short haul to railroad.
- 12-36 Yellow ochre deposit; large; three mile haul over good road to railroad.
- 12-37 Mineral paint; red; tonnage or deposit.
- 12-38 Placer property; 365 acres; Plumas County.
- 12-39 Copper deposit; large; 15 miles from Mt. Shasta. 2 to 35% copper, some silver and gold.

Mineral Products or Deposits Wanted.

- 13-23 Clay, with high alumina content.
- 13-24 Arsenic ore, capable of hand-sorting to 25% metallic arsenic.
- 13-25 Arsenopyrite or any arsenical ore; deposit.
- 13-26 Non-metallic industrial minerals.
- 13-27 Natural tourmaline crystals.
- 13-28 Magnesite; deposit.
- 13-29 Chrysotile asbestos; deposit.
- 13-30 Gold quartz property; developed, or undeveloped if existence of commercial ore can be shown. Nothing south of Tuolumne County considered.
- 13-31 Barite; deposit or tonnage. Must not contain strontium.
- 13-32 Red jasper and a hard yellow rock for roofing and stucco 'dash'; tonnage.
- 13-33 Gold placer property that is for lease or sale on easy terms.
- 13-34 Obsidian or volcanic glass; tonnage.
- 13-35 Magnesite; tonnage.
- 13-36 Mineral spring, within fifty miles of Los Angeles, that is not in use.

EMPLOYMENT SERVICE.

Following the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau registers technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of applicants for positions and 'positions open,' received by the Bureau during each 30-day period preceding the date of publication of the Monthly Chapter is carried in each issue.

Each notice is designated by a key number, and communications sent to the Bureau in reply to any notice will be forwarded to the proper party without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss.

Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 11-S Superintendent or Foreman Hydraulic Mine. Thirty years experience as owner, manager or superintendent. Age 55. References. Salary wanted \$200.

PUBLICATIONS OF THE CALIFORNIA STATE MINING BUREAU.

During the past forty-two years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield; Auburn, and Redding. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the State may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the State. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

THE STATE MINING BUREAU

CORDIALLY INVITES YOU TO VISIT
ITS VARIOUS DEPARTMENTS MAINTAINED
FOR THE PURPOSE OF FURTHERING
THE DEVELOPMENT OF THE

MINERAL RESOURCES OF CALI- FORNIA

At the service of the public are the scientific reference library and reading room, the general information bureau, the laboratory for the free determination of mineral samples found in the state, and the largest museum of mineral specimens on the Pacific Coast. The time and attention of the state mineralogist, as well as that of his technical staff, is also at your disposal.

Office hours: 9 a.m. to 5 p.m. daily.

Saturday, 9 a.m. to 12 m.

LLOYD L. ROOT,

State Mineralogist.

Third floor, Ferry Building, San Francisco, Cal.

Branch Offices: Pacific Finance Building, Los Angeles; Bakersfield, Taft, Coalinga, Santa Maria, Santa Paula, Redding, and Auburn.

MEXICO

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922, and continued until March, 1923.

Owing to a lack of funds for printing, quarterly publication was begun in September, 1923.

Such a publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff and other contributors are included. Mineral production reports formerly issued only as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance also are reported.

While current activities of all descriptions will be covered in these chapters, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added in the future as they are completed.

The chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful, latent resources of the State of California.

'Mining in California' is sent without charge to those on the Bureau's exchange list and to others who make written or verbal request.

Pages are numbered consecutively throughout the year and an index to the complete reports is included annually in the closing number.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each district working out from field offices that were established in Redding, Auburn, San Francisco and Los Angeles, respectively.

This move brought the Bureau into closer personal contact with operators, and it has many advantages over former methods of conducting field work.

To continue this system most effectively with the limited funds available for the next biennium, the Redding and Auburn field offices were consolidated and moved to Sacramento on June 1, 1923.

The boundaries of each district were adjusted and the counties now included in each of the three divisions, and the locations of the branch offices, are shown on the accompanying outline map of the state. (Frontispiece.)

Reports of mining activities and development in each division, prepared by the district engineer, will continue to appear under the proper field division heading.

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the state's oil fields is included under this heading.

REDDING FIELD DIVISION.

W. BURLING TUCKER, Mining Engineer.

Lassen County.

Corona Copper Mine. The property is situated near Milford, in T. 27 N., R. 14 E., southwest of Honey Lake, near the Lassen and Plumas County line.

The mine is being developed by Marr and Fex of Milford, and it is reported that a large body of copper ore has been exposed that runs from 2 to 15 per cent copper.

Shasta County.

American Mine, situated in Secs. 12 and 13, T. 33 N., R. 7 W., on the ridge north of Cline Gulch, $3\frac{1}{2}$ miles northeast of French Gulch. Elevation, 2800 feet. Owner, W. Frank, of French Gulch. Holdings consist of the following claims: American, Wheeler and Summit, totaling 100 acres of which 60 acres are patented. The property has recently been examined by engineers representing Comstock, Nevada, interests. It is reported that a bond has been taken on the property, and that active plans of development will be started in the near future, under the supervision of Harry M. Thompson, of French Gulch. Several men are employed in repairing the road to the workings which are located on the ridge north of Cline Gulch, between Clear Creek and J. I. C.

Gulch. The workings consist of tunnels at several elevations between 2500 feet and 3500 feet.

Bibliography: State Mineralogist's Reports VIII, pp. 564-565; X, p. 637; XII, p. 245; XIII, p. 349. U. S. Geological Survey Bull. No. 540, pp. 35, 60-61.

Lewis Gardella of Oroville, dredge operator, has purchased from the American Gold Dredging Company 310 acres of land on Clear Creek.

Highland Mine. The *Iron Mountain Investment Company*, a subsidiary to the *Mountain Copper Company*, has received a patent for the Highland Lode mining claim, in Sec. 35, T. 33 N., R. 6 W., in the Flat Creek Mining District.

The Mount Shasta Silica Company, of Weed, Siskiyou County, has purchased forty-six placer claims, known as the Insulator Group. These claims are located on a large deposit of diatomaceous earth in the northeastern part of Shasta County, near Bartle Station, on the Pacific Gas and Electric Company's railroad to Pit No. 1 power plant.

Silver Falls and Chicago Consolidated Mines, are situated four miles northeast of Igo, in the South Fork Mining District, in Secs. 17, 18, 19 and 20, T. 31 N., R. 6 W., at an elevation of 1400 feet. The property is under option to the *California Bi-Metallic Corporation*, L. G. Vinson, president; Paul Drinkwitz, secretary; Louis F. Eaton, general manager. Office, 21 Carrillo Building, Santa Barbara, California.

A detailed description of this property is to be found in the July chapter of Report XVIII of the State Mineralogist, pp. 316-317.

Active development operations were started by this company the latter part of October, 1922. Since that date, a total of 1400 feet of development work has been done, including raises, crosscuts and drifts.

Mine development: At 500 feet from the portal of the main tunnel level, drifts have been driven on the Pillehuck vein for a distance of 271 feet northeast, and to the southwest a distance of 50 feet. In the drift to the southwest the face shows 3 feet of mineralized quartz. It is stated that samples taken from the vein have an assay value of \$25 per ton, in gold and silver. At the intersection of crosscut No. 36 and the drift on No. 28 vein, a raise has been put up on No. 28 vein for a distance of 155 feet, and then on an incline of 50 degrees west, and it has less than 250 feet to go on the incline to reach the surface. The vein as developed by this raise has a width of 6 inches to ten inches of mineralized quartz.

The drift on No. 28 vein has been extended 250 feet northeast. At about 380 feet from the raise a rich shoot of ore was encountered, showing from 8 inches to 2 feet of quartz. Samples taken from this shoot are said to average \$100 per ton, with \$15 in gold. The main crosscut tunnel was extended 190 feet to vein No. 36. A crosscut was driven south from No. 27 drift 30 feet to vein No. 26, then drifted northeast on this vein 120 feet.

Surface development: In the Buckley tunnel, which is on the main Chicago-Madison lode, the drift on the vein has been extended 40 feet, making a total distance on the vein of 120 feet. The shoot of ore

developed on this vein is from 80 to 100 feet in length, 12 inches to 2 feet in width, and assays from it are reported to have a value of \$65 in gold and silver per ton. About 340 feet northeast of No. 2 Wright shaft, at an elevation of 2000 feet, a tunnel is being driven north to cut the shoot of ore developed in the Buckley tunnel. This tunnel is in 80 feet, and will give about 250 feet of backs. At the collar of No. 2 Wright shaft a crosscut tunnel is being driven north to cut the main Chicago vein. The tunnel is now in 130 feet. At about 50 feet from the portal the tunnel cut two veins, which have widths of 12 inches to 18 inches, assaying \$25 to \$30 per ton in gold and silver. In the ore developed in the Buckley, and the tunnel from the Wright No. 2 shaft, the principal values are in gold, some assays showing as high as \$65 in gold with \$16 in silver.

Equipment consists of Type W. G. 6, 12" x 12" Sullivan compressor, capacity 365 cu. ft., driven by 50-horsepower Holt gas engine; high pressure blower, 12-inch outlet driven by 10-horsepower gas engine; Sullivan drill sharpener, 6 Sullivan air drills and 12 ore cars. Buildings comprise assay office, compressor house, blacksmith shop, two bunk houses, office and superintendent's residence. Twenty-five men are employed.

Bibliography: State Mineralogist's Report XVIII, pp. 313-317.

The *Sybil Mine*, which is located in Sec. 7, T. 33 N., R. 7 W., 5 miles northwest of French Gulch, recently suspended operations. The property is owned by the *Shasta Mining Company* of San Francisco, and has been under active operation for the past two years by Harry M. Thompson and associates of San Francisco, California.

The main working tunnel is driven southeast 700 feet at an elevation of 3700 feet. A winze was sunk from this level to a depth of 150 feet. At 80 feet below the tunnel a drift is driven 175 feet east, and 175 feet west on the vein.

Equipment consists of 12" x 12" Laidlaw-Dunn Gordan compressor, driven by 50-horsepower motor; 5-stamp mill, 1000 lb. stamps, and Frue vanner.

Bibliography: State Mineralogist's Report XIV, p. 777. U. S. Geological Survey Bull. No. 540, pp. 68-69.

Texas Consolidated Mine, which is situated in the Old Diggins Mining District, 9 miles north of Redding, is under lease and bond to Harvey Sallee of Old Diggins. The main working tunnel, known as No. 5 tunnel, is driven N. 10° E., 1600 feet and is 910 feet below the surface outcrop. The vein strikes N. 10° E. and dips 70° to the east, and where worked is reported to have been from 8 to 12 feet in width. The vein is faulted by a series of N. 40° W. faults, which cut off the ore. The present development work is confined to driving two crosscuts on No. 5 level, one to the east and the other to the west, located beyond the winze sunk from this level, with the idea of picking up the ore shoot that was cut off by one of these N. 40° W. faults.

Four men are employed on development work.

Bibliography: State Mineralogist's Reports, X, pp. 629, 630; XI, pp. 43, 395-397; XII, p. 258; XIII, p. 365; XIV, p. 800.

Siskiyou County.

Asbestos Group of Mines, owned by M. A. Russell, of Edgewood, has been purchased by the *National Cement Company* of Modesto. This company is planning to develop the deposit.

Eliza Mine, is situated in the Humbug Mining District, in Secs. 4, 8, 9, T. 45 N., R. 8 W., 15 miles west of Yreka. Holdings consist of five claims. The strike of the vein is N. 20° E. Vein has a width of 5 to 12 feet.

Development consists of 5 tunnels; a lower tunnel 1400 feet long and others from 100 to 800 feet in length. There is a 10-stamp mill on the property.

R. H. De Witt and associates of Yreka, owners. Plans are being made to resume operations at an early date.

Jonas Salstrom Mine and ranch, located near Orleans, has recently been purchased by the *Peacock Gold Placer Mining Company*. A crew of seven is employed by the company in building a flume from the mouth of Wilder Creek where it empties into Camp Creek.

Oregon Mine, formerly known as the *Hegler mine*, which is located on Lawson's Gulch, 12 miles northwest of Yreka, at an elevation of 3800 feet, is being developed by a 900-foot crosscut tunnel driven through Greenhorn Mountain to pick up the rich vein lost in the old workings. The general course of the vein is northeast and southwest, and it dips 70 degrees east, between slate and porphyry walls. The vein varies in width from 6 inches to 6 feet. The old workings consist of three tunnels, about 80 feet apart, from 100 to 700 feet in length.

Fairchild Mine is situated west of Hawkinsville, and is being operated by F. W. Billings, of Hawkinsville. It is reported that in recent development work a vein of quartz was uncovered, said to be 8 feet wide, with some rich ore.

Osgood Mine is situated 2 miles west of Yreka. Elevation 2800 feet. Judson C. Hubbard et al., of Yreka, owners. Holdings consist of eleven claims.

Several different vein systems occur in a belt of metamorphic slate, porphyry and schist, striking north and south, with the general trend of the range, and dipping almost vertical. The belt is interrupted and broken in many places due to local disturbances. The auriferous veins follow the strike of the belt, and are usually of narrow widths. Four of these vein systems have been cut by a crosscut tunnel 116 feet in length the pay streaks occurring in narrow seams and fractures in the zones. Oftentimes the quartz is entirely lacking in the veins, the gold being deposited along fractures in the rock. About 90 per cent of the values occur as free gold, little pyrite being found. The limits of the ore zone are well defined and are determined by panning. Most of the work is confined to the 150-foot shaft, from which it is reported over \$10,000 was taken. The shaft is intersected by a tunnel at a depth of 150 feet. Considerable stoping has been done from the 100-foot level to the surface, where the vein was evidently of good width, while little work has been done below that level.

Equipment consists of blacksmith shop, assay office, 5-stamp mill, 1050-lb. stamps, and amalgamation plates. Mill driven by 30-horsepower motor. The property is being reopened by the owners, and it is reported they plan to place the mill in operation at an early date.

Victory Gold Mining Company and the *Oak Bottom Placer Syndicate* have installed a large amount of equipment on the Victory properties, also have expended a large amount of money on the construction of flumes for hydraulicking the Oak Bottom claims on the South Fork of the Salmon River. It is reported that hydraulic operations are under way.

Trinity County.

Italian-American Hydraulic Mine, located on the Paulson Ranch, near Lewiston, is under operation. The gravel here is cemented and has to be blasted, which is done by running a system of tunnels on bed rock into the gravel bank, then forming T-drifts, loading with black powder and blasting.

One giant is under operation. Eight to ten men are employed. Season will last until July 1st.

Lorenz Hydraulic Mine, situated south of Weaverville, is under operation. Three giants are being operated night and day. The gravel bank is from 10 to 30 feet high. The ground is reported to run about \$5,000 per acre.

North and west of Weaverville, the Lorenz Bros. are also operating two giants.

The season run is about four months, and the water supply will probably enable the operators to run until July 1st. Ten to twenty men are employed. William Lorenz and Bros., of Weaverville, owners.

Pittsburg-Comstock Mines Company started hydraulic mining on their property on Canyon Creek near Dedrick, the first of May, 1923. The company has expended a large amount of money in building a water ditch and equipment, and with the monitors operating at capacity it is reported that they plan to hydraulic 5000 yards of gravel every 24 hours. The property contains approximately 1100 acres and water for the giants is delivered under a pressure of 640 feet. Water is secured from Canyon Creek through 4 miles of flume and ditch. Three known channels have been developed on the property. These channels have a general northerly and southerly course. Depth of gravel is from 30 to 80 feet, with widths of 300 to 500 feet.

Gravel consists of large boulders of schist and granite, with an overburden of red soil. Bedrock is schist. The gold is usually coarse and occurs near and on the bedrock.

The gravel is reported to average from 25 to 50 cents per yard. One 5-inch giant is under operation, on what is known as the East Channel, at an elevation of 3000 feet. Company plans to place three giants under operation during the summer. Twenty-five men are employed. Owner, Pittsburg-Comstock Mining Company. Offices, Reno, Nevada. Herbert B. Humphrey, president; A. E. Kane, secretary; T. M. Gibson, superintendent.

Unity Hydraulic Mine, situated near Minersville, on the East Fork of the Stuart Fork of the Trinity River, is being operated by the *Nugget Bar Placer Company* of Oakland. Two giants are under operation. Twenty men are employed.

AUBURN FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

Most of the time spent in field work in April was devoted to the Mother Lode report, and the following notes were taken incidentally to the above work. Much time was spent during May in moving the two former branch offices from Auburn and Redding to the new office in Sacramento.

Nevada County.

The report of *North Star Mines* for the past year's operations has lately been made public. The following items are of general interest:

| | |
|--------------------------------------|---------|
| Tons delivered to sorting plant..... | 154,569 |
| Tons crushed | 115,600 |
| Average yield, per ton..... | \$9 41 |
| Operating cost, per ton..... | 6 99 |
| Development cost, per ton..... | 1 14 |
| Combined cost, per ton, crushed..... | 8 13 |

Attention was called to the fact that the cost of producing \$1 in gold from this mine was 86½ cents in 1922 as compared with 54 cents for the five years beginning in 1912, the increase being attributed principally to increased costs rather than to decrease in the grade of ore. The need of developing new orebodies soon was mentioned, and the possibility of stopping or curtailing milling was discussed.

A prospecting venture of considerable interest has lately been announced at Grass Valley. For some time Roy King had believed there was a chance to pick up the extensions of some of the famous veins of the district on Alta Hill, just north of Grass Valley, where the surface is largely lava capped. The area appeared to him to be the place where the fissures should converge, if they maintain the strikes they have where worked in the big mines of the district. The *St. John* and other old quartz and gravel mines were consolidated by King as the *Grass Valley Gold Mines, Consolidated*, and the *Hilltop-Nevada Mining Co.* became interested in the project. Work was begun during April on a new vertical shaft, which, according to announced plans, will be sunk 500 feet at least and then exploratory crosscuts and drifts will be run.

Placer County.

During the spring, A. T. Thebo and associates installed equipment for placer mining on the *Sam Laird Ranch*, four miles southeast of Loomis, and began digging late in April. The deposit is the wide shallow portion of an old channel, and has little grade. An attempt to work it by hydraulic elevator some years ago was not very successful on account of the peculiar configuration of the bedrock and the difficulty of moving the equipment from one set up to another.

The present equipment comprises a drag line scraper with capacity of one cubic yard, gin pole, two steam engines of about 45-horsepower each, a 40-foot hopper, 260 feet of sluice with a grade of 8 inches in 12 feet, and 70 feet of tail sluice. Using several hundred feet of cable, the scraper delivers its load to the hopper, which is set high to furnish room for grade for the sluice and dump room for tailing. Water for washing the gravel is pumped to the head of the sluice by a centrifugal pump operated by one of the steam engines and furnishing at the time of visit about 75 inches. Operations were just getting under way at the time of visit and the actual working capacity of the scraper and the grade of the gravel were matters of uncertainty. Six men were employed. Crude oil, hauled from Sacramento, was being used for fuel and Thebo stated the cost of operating with this power compared favorably with the cost of electricity, although an electric line passes within half a mile.

An expensive flume has been built lately to convey water for power at the *American Bar Quartz claims* on the Middle Fork of American River, 2 miles south of Michigan Bluff. Development work is reported to be giving encouraging results.

F. A. Moss is continuing work in the prospect adit of the *Blue Eyes* property in Duncan Canyon and reports conditions indicate the nearness of the channel.

El Dorado County.

Big Buzzard Mine is in the SE $\frac{1}{4}$ of Sec. 29, T. 11 N., R. 8 E., fourteen miles from Auburn. It is owned by Mrs. Jane Darrington, Geo. and Bert Darrington and J. P. Foster. It has been worked in a limited way for many years, but the total amount accomplished has been small, due to limited funds and frequent shut-downs. The property includes a full claim and a south extension of 1000 feet. The vein dips east and strikes north to northwest.

An inclined shaft on the vein has been sunk 267 feet, with levels at 70, 160 and 260 feet. On the 70-foot level, a drift was run north on a curving course for 80 feet and a stope about 45 feet long, 35 feet high and 5 feet thick was worked. On this level south, a drift has been run 40 feet and a thickness of 8 to 10 feet was stoped to a height of 25 feet and a length of 20 feet. The ore from the south stope is said to have returned about \$14 a ton in gold, without saving the concentrate, and a little sorted ore from this stope showed satisfactory amounts of silver, copper and lead also. The results from the north stope as reported by the owners showed about one-half as much gold as on the south. On the 160-foot level north, 40 feet from the shaft and within 10 feet of the face, a dike a foot wide cuts across the vein, and from what can be seen, may mark the north boundary of the shoot. On the south on this level the drift is in 36 feet and shows heavy complex sulphide ore the width of the drift. Similar ore occurs in the shaft from here to the sump. The ore-shoot appears to be pitching south and to be principally south of the shaft, but there has not been sufficient drifting in this direction to show the extent of ore. The hanging wall on the 260-foot level is broken and heavy, white mica-schist and the foot-wall is smoothly polished, hard amphibolite-schist. There is only 15

feet of drifting on the 260-foot level, in a northerly direction, and the heavy ore is in evidence here on the south side of shaft. Besides the crushing of the hanging wall, there has been some post-mineral movement on the footwall and within the vein about two feet from the foot-wall.

The mine shows several kinds of ore, with pyrite, chalcopyrite, galena and zincblende. The heavy complex ore carries a good deal of zincblende, and the values are reported to be capriciously distributed, as far as assays show. What system of treatment will be finally adopted to mill the ores of the mine has not been determined, but flotation tests are reported to have given satisfaction, and differential flotation may solve the problem. There is a 5-stamp mill which has not given good results. The hoist is operated by a 19-horsepower gas engine. A perpetual water supply could be pumped from the river, one-half mile distant and 400 feet lower. Electric power is about 6 miles distant.

Jones Mine is near Diamond Springs and is east of the Mother Lode on a quartz stringer a few inches wide, striking east. It has made some production as a pocket mine previous to present operations. It was reopened in 1922 by J. M. Brown, Mrs. Allie Lange and others of Bakersfield. Since reopening, it has made a few thousand dollars production in pocket gold, which is recovered by rocking. The pay appears to have been deposited where the vein approaches dikes which run with the general course of the country rocks, northwest.

There is a shaft with three levels at 75, 165 and 225 feet depth. There was about 500 feet of drifting on the first level, 100 feet each east and west on the second, and drifts were just being started late in March on the third level. The property is equipped with one 25-horsepower and one 10-horsepower gas engine, 9-inch by 8-inch air compressor, hoist and improved jackhead pump. About 60 gallons of water is pumped per minute.

Jumbo Placer Mine is a creek placer a mile west of Clarksville. It was formerly known as the *White Rock Land and Mineral Company*. It comprises 80 acres, of which possibly one-fourth or less is a shallow gravel deposit along the meandering course of Carson Creek. The ground has been worked in part by sinking shafts to bedrock and drifting out small areas as long as the ground would stand without timber, and in part by surface placering. The gravel is 8 to 15 feet deep.

H. S. Brinley of Seattle has taken a Marion No. 31 drag line scraper outfit to the property and on June 12 was preparing for a trial run. The scraper outfit is on a caterpillar mount and the bucket works from a 50-foot boom, making it possible to work a strip 120 feet wide, and the set-up can be changed in 3 hours, making for much greater mobility than with the scraper working from a gin pole.

There is a scarcity of water in summer on the property, and after the test run it is not likely that much can be done until the winter storms begin. Water will be pumped to the sluices from a reservoir. The scraper will deliver to a hopper at the head of the sluices, raised enough to give dump room, and tailings will be stored in the worked-out pits.

A gasoline engine and pump have been taken to the *Lukens Mine*, three and a half miles from Cool on the east side of American River, to

unwater the old workings and investigate the prospect said to have been left in the bottom. A. M. Dunlop of Auburn is in charge of work.

There are two shafts on the property, 150 feet apart, and 60 and 90 feet deep, respectively, being connected by a drift. The small vein has yielded some high grade ore, but there is no exact record of the amount.

Work is going on at the *Sliger Mine* near Spanish Dry Diggings, preparatory to an announced reopening. The Sliger was found in 1864 and was noted as a producer of rich ore. The Sliger patent contains only 5 acres, covers 530 feet on the vein, and was worked to a depth of 298 feet and a length of 231 feet, according to the owner's records. Ore to a depth of 200 feet and a length of 160 feet is supposed to have been milled. There was a 5-stamp mill on the property in the seventies.

Amador County.

The main shaft at the *Argonaut Mine* has been concreted to a depth of 40 feet and the hoist has been set on new concrete foundation. Unwatering is reported completed.

The Elephant Deep Hydraulic Mine at Volcano has been in operation lately under lease.

Twenty stamps of the mill are in operation at the *Fremont Mine* and Superintendent B. I. Hoxie reports that lack of labor is the only hindrance to operating on a larger scale.

Work was begun in April on the Big Tunnel of the *Mammoth Mine* south of Jackson near Mokelumne River. This was one of the mines worked by Captain Nevills, thirty-six years ago.

Moore Mining Company has been reorganized, with several changes in personnel. The company was having trouble keeping the mill supplied with ore and at the same time carrying on necessary development work. Plans for deepening the shaft and opening new ground have been announced.

Wait Marble Deposit. A. L. Wait of Plymouth has a deposit of red marble on the Drytown-Sacramento road, three miles from Drytown and eight miles from the railroad at Carbondale. The marble outcrops beside the road over an area 160 feet by 400 feet. A pit opened here would have to be pumped as the surface is flat. The stone has a very pleasing dark red color when polished. The deposit has never been drilled or otherwise prospected, so nothing is known of its depth or tonnage.

Tunnel Hill Ochre Deposit is three miles by road from the railroad at Martel, near the Mokelumne Hill road. A. F. Roberts of Jackson has a five year lease. This is a large deposit of yellow ochre, forming the bedrock of an old hydraulic mine. One or two small shipments were made several years ago for testing purposes, but there has been no work since.

Calaveras County.

La Fortuna Mines Company, a trust corporation, 316 Hobart Building, San Francisco, have begun work on the *Lucas Mine* on Mokelumne River, one-half mile upstream from the Jackson-Mokelumne Hill road.

This is an old property, formerly productive. It contains three claims, one on the Lucas vein which has been developed, and two on the parallel Pilot vein to the east.

The Lucas vein strikes nearly north and dips 60 to 65 degrees west, in diorite. It has been developed by an adit which is a crosscut 260 feet to the vein, then drifted south 574 feet on the vein. A winze was sunk from the drift 440 feet from the portal to a depth of 131 feet on the vein, giving a total depth of 273 feet on the vein. In the winze 60 feet below the adit a level was turned and drifted 108 feet north and 109 feet south, with a crosscut 22 feet east in the north drift. The vein is of good width in the adit and has been stoped thence to the surface for a length of 285 feet. In this distance two ore shoots are reported, the North shoot 65 feet long and the Mexican shoot 106 feet long. While the present operators report that the vein assays fairly well here for a distance of 405 feet, it would appear from their records that the pay ore was in these two shoots. Veins striking southeast and dipping southwest cross and fault the main vein a few feet, and the ore appears to occur at and near these crossings. The last ore milled is claimed to have plated \$6.35 a ton, but no definite record is available. The winze was full of water at the time of visit, but it was stated that the vein has an average width of $3\frac{1}{2}$ feet of white quartz in the 60-foot level, assaying on an average much lower than in the adit above. The east crosscut on the lower level was started to follow one of the cross veins found above, and the low assays might be due to this level not having been run to the larger shoot, if the length stated for the drift is right.

The property is supplied with electric power from a line passing the adit. It is equipped with a 5-drill air compressor, 40-horsepower motor and air drills and small buildings. A pump was to be installed to unwater the winze.

Maloney Prospect, adjoining the town of Mokelumne Hill, is to be prospected by John Seip and associates. The claim contains a wide, solid quartz vein, which strikes north and dips 80 degrees west, with a cross vein. Both veins have been worked only a little near the surface by pocket hunters.

Disappointing results have been reported from the *Red Hill Gravel Mine*, $2\frac{1}{2}$ miles from Mokelumne Hill. After starting work on a flattering prospect that appeared to be in new ground, old workings are said to have been encountered, of which there was no record, where early day miners had removed the best gravel.

Tuolumne County.

A 2-stamp mill, concentrator and compressor have been put on the *App Mine* and some ore is being crushed from shallow workings. C. W. Ayers, D. E. McPherson and J. A. Keyes are interested.

Encouraging reports continue from the *Casa Madera* prospect on the East Belt in the Confidence district. This is so far a surface showing but the company has great faith in it and has placed a large order for lumber for buildings.

Nevada Wonder Mining Company has abandoned the option on the *Chileno* and other claims of a large group on Jackass Hill near Tuttle-town. As soon as they quit, the *Chileno* was taken under lease and

option by L. L. Coffey and G. L. Warrington. They were getting an old stamp mill in shape and putting in a Huntington mill late in March, preparatory to stoping and milling ore from the 150-foot level.

The Chileno was opened to a depth of about 500 feet on a 74-degree incline by the former company, and levels were run at 150 and 450 feet. An ore shoot of very good width and tenor and about 160 feet long was opened on the 150-foot level. On the 450-foot level over 1000 feet of work was done, of which over 500 feet was crosscutting. This level did not come up to expectations. They also drove the Bailey crosscut adit over 500 feet southwest and south toward the Chileno, but found no ore although several barren veins were cut.

The long drift being driven northward from the *Crystalline* under the *Alabama* property had reached a point at the end of March where the *Tonopah Mining Company* expected to begin the real prospecting of the Alabama claim, for the downward extension of the Alabama ore shoot. This work will be done in the area under the old shaft, and on the 600-foot level. This level is also being run on the south, under the *Crystalline* group. No conclusive results have been reported yet from these properties, as attention has been devoted to running the drift, and crosscutting is yet to be done to explore the country on the two sides of it. Since the above was written, the company is reported to have quit work.

Omega Mine, adjoining the Alabama on the north, was unwatered by the end of February and at the end of March the shaft had been repaired and work was being done upon the 600-foot level, clearing out and catching up ground preparatory to exploration. P. A. Herivel of Jamestown is in charge.

Sonora Wonder Mine, beside the state highway about a mile below Sonora, is being prospected by W. J. Woolsey. A light prospecting hoist and small engine are in use and late in March the shaft was down about 70 feet. A good prospect is reported.

SAN FRANCISCO FIELD DIVISION.

C. McK. LAIZURE, Mining Engineer.

Mendocino County.

COAL IN MENDOCINO COUNTY.

Historical:

The occurrence of workable bodies of coal in Mendocino County has been known for many years. Reports made more than fifty years ago are available describing the deposits and containing analyses of the coal. Goodyear,¹ in his report published in 1877, referring to known California coal localities says:

"Fourth. On the Middle Fork of the Eel River about seven or eight miles south of the village of Round Valley in Mendocino County, and in the northwest corner of section 11, T. 21 N., R. 13 W., M. D. M., there is a bed of coal exposed crossing the channel of the river in a direction N. 45°-50° W. magnetic and dipping from 20°-30° northeast.

"This bed is from fourteen to fifteen feet thick and is all good coal, with the exception of a single streak of shale in the middle of it, about five or six inches in thickness. * * *

¹Goodyear, W. A., Coal Mines of the Pacific Coast. Bancroft & Co., publishers, San Francisco, 1877.

"The quality of the coal itself is a little better than that of the Mount Diablo mines. In fact it is the best coal which I have seen from anywhere in California; while at the same time it is the thickest bed of a marketable quality of coal that is yet known to exist within the state."

Another early report on the Eel River coal deposit is found in 'Mineral Resources West of the Rocky Mountains,' by R. W. Raymond, U. S. Commissioner of Mining Statistics, 1875. At that time, it will be noted, the deposit was practically isolated. The Raymond report, in part, states:

"The Mount Vernon Coal Mine is situated on both sides of Middle Eel River (a mountain torrent), in townships 21 and 22 north, range 13 west, Mendocino County, California, and lies northwesterly from Ukiah, distant in an air-line, thirty-eight miles, and about sixty miles by the county road, which has been constructed from Ukiah City to Round Valley, a government military station. This road at its crossing of Middle Eel River passes within two miles of the Mount Vernon Mine and there is a good trail along the riverside from the road to the property. Noyo is its nearest seaport. A circuitous road forty-two miles long connects the two places. The projected line of the North Pacific Railroad (a California enterprise) passes within four miles of the mine, crossing at the junction of Middle and South Eel rivers. The property consists of 7200 acres of land.

"No work of importance has as yet been done to develop the resources of this coal field. The value of the property can only be prospectively estimated. The coal has been traced six miles. The land is admirably located with reference to the strike and dip of the coal as shown by its various outcroppings. All the property on which the coal is exposed and the land into which it dips are covered by United States patents.

"Commencing at a point about one mile south 35° east from the coal outcrop in the river, the coal first makes its appearance in a creek on the side of a steep hill, covered by a thin layer of shell limestone broken up and mixed with decomposed shale and soil colored red with ferruginous matter. Tracing along the line of the croppings north 35° west to the banks of the river, over undulations caused by landslides, which gradually flatten as the stream is approached, and in which detritus and boulders of all sizes lie scattered in profusion, an immense body of coal is found, entirely denuded of all its encompassing strata. For nearly 600 feet in length, with a height of 14 feet, a body of coal is exposed, forming an abrupt bluff, over which the water runs, occasionally detaching huge masses of coal from the outcrop and hurling them down the stream. * * *

"The thickness of the strata as here exposed is about 20 feet. High water prevented the accurate measurement of the bed. Actual measurement, where practicable, showed 14 feet of coal in the stream, and a calculation of the thickness of this bed from the encompassing walls showed it to have been 20 feet through, from 5 to 6 feet having been washed away. These immense croppings extend across the river, a width of 350 feet. The banks on both sides being low, the coal beyond the river gradually enters the detritus and soil, and for a distance of several hundred feet southeast lies only a few feet underground. A crosscut made on the surface 400 feet from the river on the northwest side, is said to have shown a solid stratum of coal 20 feet thick. The coal in the river lies between two strata of gray argillaceous shale. The edges of the upturned strata have slacked and assumed a reddish brown color. The shale underlying the main coal-bed contains several seams of coal, varying in size from 1 to 8 inches. The exposed thickness at the surface of the shales underlying the coal is about 19 feet, the dip being 21 degrees. The shale is succeeded by a thin bed composed of fossil oyster shells, some of which are very large. A soft yellow and brown sandstone, partly disintegrated, underlies it.

"An examination of the overlying shale on the southeast side of the river, below high-water mark, and a foot below the surface, showed it to be of grayish color, hard, compact and of such a nature as will form a strong and solid roof, impervious to water, and a great protection for the future working of the mine. Overlying the shale is sandstone, soft and totally disintegrated, and along the banks of the river detritus and metamorphosed rock overlie the sandstone. * * *

"Three-quarters of a mile northwest of the river croppings, under an abrupt bank (the sides of which have been cut and washed away) at an altitude of about 200 feet, a bed of coal 6 feet thick has been exposed. * * * Three hundred feet above these croppings, about a mile and a half northwest of the river croppings, coal again shows itself in a mountain creek, issuing from an abrupt bank of columnar sandstone about 60 feet high. Black dirt and fragments of coal on all sides, embedded in a whitish clay, indicate the presence of coal. No definite stratum has here been found; nor has the ground been prospected. Crossing to the north the ridge of sandstone, shale and detritus, and descending on the opposite side of the hill, a distance of four and a half miles from the croppings in the river, coal again makes its appearance on the side of a creek. * * * Northwestly for half a mile the coal can still be traced.

"The coal is hard and bituminous. It burns freely and with a bright flame, gives a good compact coke, and leaves but little ash. A proof of its purity is the circumstance that the water which pours over it from the springs remains pure and drinkable. The coal gives a strong heat and will prove an excellent coal for generating steam, producing gas,¹ and for domestic use.

"Although exposed to the action of the air and water, it does not slack to any great extent, but remains remarkably hard and compact. From repeated experiments with it in large quantities, a mere trace of sulphur is perceptible.

Analysis of coal from vein running through Eel River to Round Valley: S. W. Glazier, Esq (for the company).

"Dear Sir: I have made a careful analysis of a specimen of coal received from you and have arrived at the following results:

| | |
|-------------------------------------|----------------|
| "Specific gravity | 1.282 |
| Volatile combustible substance..... | 40.20 per cent |
| Fixed carbon | 49.70 per cent |
| Moisture | 6.70 per cent |
| Ashes | 3.00 per cent |
| Sulphur | 0.40 per cent |

"Amount of gas evolved, 37 cubic feet for 10 pounds Avd. of the coal.

"The coal burns freely, yields a fire light and compact and sonorous coke, and its ashes are of a reddish gray color and do not slag.

"The amount of sulphur is so minute that it does not make itself perceptible to the smell in burning the coal.

Respectfully yours,

L. FALKENAU, State Assayer.

"San Francisco, December 8, 1870."

In a detailed report on the Chemical Examination of Pacific Coast Coals made in 1872 by S. F. Peckham,² the author gives the results of analyses of 20 samples of foreign and California coals. This table is here reprinted in full:

¹Yield of gas per ton of coal, 11,250 cubic feet; illuminating power of gas, 15.3 candles; carbonic acid, 7 per cent.—London Analysis.

²Peckham, S. F., Chemical Examination of Pacific Coast Coals. Geological Survey of California, Economical Geology of the Coast Ranges; Vol. II, Geology.

Commenting on the results shown, Peekham continues:

"Arranged according to the total amount of combustible material that they contain, their relative value would appear as follows:

| | |
|--|-----------------|
| 1. No. 65 (Nanaimo) ----- | 90.735 per cent |
| 2. No. 66 (Saghalien) ----- | 89.41 per cent |
| 3. No. 67 (Los Bronces) ----- | 89.39 per cent |
| 4. No. 55 (Comox) ----- | 88.87 per cent |
| 5. No. 53 (Chili) ----- | 87.80 per cent |
| 6. No. 64 (Sydney) ----- | 86.725 per cent |
| 7. No. 57c (Eel River) ----- | 86.39 per cent |
| 8. No. 52 (Nanaimo) ----- | 85.18 per cent |
| 9. No. 57b (Eel River) ----- | 84.80 per cent |
| 10. No. 57a (Eel River) ----- | 84.21 per cent |
| 11. No. 54 (Coos Bay) ----- | 83.215 per cent |
| 12. No. 60 (Union Mine) ----- | 81.795 per cent |
| 13. No. 63 (Black Diamond) ----- | 81.785 per cent |
| 14. No. 61 (Stewart's Mine) ----- | 80.505 per cent |
| 15. No. 62a (Clark Bed) ----- | 80.225 per cent |
| 16. No. 68 (Seattle) ----- | 80.115 per cent |
| 17. No. 51 (Bellingham Bay) ----- | 78.505 per cent |
| 18. No. 59 (Black Diamond) ----- | 76.385 per cent |
| 19. No. 56 (Corral Hollow) ----- | 72.240 per cent |
| 20. No. 62 (Q. Charlotte Island) ----- | 67.085 per cent |

Nos. 1 and 2 are caking coals. No. 3 is an anthracite. Nos. 4 and 5 are caking coals. No. 7, a noncaking coal, appears to be more valuable, and Nos. 9 and 10 but little less valuable than No. 8; but this inference may not be a fair one, * * *. In Nos. 7, 9 and 10 the percentage of this volatile matter (water volatile under 250°) is two and one-half times greater than in No. 8, while the percentage of ash in No. 8 is nearly twice that found in the others; yet No. 8 may be much more valuable than either of the three."

The following data on Eel River coal are taken from a table of analyses of California coals published in Report XII of the State Mineralogist, 1894:

| Locality | Color of powder | Color of ash | Cok- ing quali- ties | Water | Volatile matter | Fixed carbon | Ash | Author- ity |
|---|-------------------------------------|---------------|-------------------------------|-------|--------------------|-----------------|-------|----------------|
| Middle Fork Eel River: Main tunnel ---- | Glistening black, brown tinge -- | White.----- | None | 8.00 | 39.25 | 46.25 | 6.50 | Mathyas |
| Incline, 20 feet down, cropping in river----- | Glistening black, brown tinge -- | Reddish white | None | 7.50 | 17.75 | 47.75 | 27.00 | Mathyas |
| Top streak----- | Glistening black, brown tinge -- | Reddish white | None | 6.75 | 40.00 | 47.50 | 5.75 | Mathyas |
| Bottom streak -- | Glistening black, brown tinge -- | Reddish white | None | 6.25 | 31.50 | 46.25 | 16.00 | Mathyas |

Two analyses and tests made by Louis Falkenau, state assayer, and by Thos. Price & Son, respectively, in August, 1890, are appended:

"No. 14,357

"San Francisco, August 2, 1890.

"J. L. Flood, Esq.,

"Dear Sir: I have made a careful technical analysis of a sample of coal received from you, marked 'Eel River Coal Mine, Mendocino County,' and a sample marked 'Wellington,' with the following results:

| | Eel River | Wellington |
|----------------------------|---------------|----------------|
| "Specific gravity ----- | 1.302 | 1.300 |
| Moisture ----- | 7.9 per cent | 2.4 per cent |
| Volatile combustible ----- | 36.2 per cent | 33.45 per cent |
| Fixed carbon ----- | 53.5 per cent | 58.6 per cent |
| Sulphur ----- | 0.4 per cent | 0.15 per cent |
| Ashes ----- | 2.0 per cent | 5.4 per cent |

"The cokes furnished by the two coals (sample of which I hand you with this report) are the same in appearance, but that of the Eel River coal contains 3.6 per cent of ashes, while that of the Wellington contains 8.4 per cent.

"The Eel River coal weighs 81 pounds per cubic foot and in place 24.7 cubic feet will weigh a ton of 2000 pounds, but to store a ton, about 42 cubic feet will be required.

"As the sample of Eel River coal is, according to your statement, from the surface exposed to extraneous moisture, it is to be assumed that the coal at greater depth will contain much less moisture. If the Eel River and Wellington are both figured to dry coal, their carbon compares as follows:

| | Eel River | Wellington |
|----------------------------|----------------|----------------|
| "Volatile combustion ----- | 39.73 per cent | 34.42 per cent |
| Fixed carbon ----- | 58.19 per cent | 60.04 per cent |
| Total carbon ----- | 97.92 per cent | 94.46 per cent |

"From the foregoing I consider sample of Eel River coal as equal to the Wellington for domestic use and as fuel for steam boilers.

Yours respectfully,

(Signed) Louis Falkenau."

"August 11, 1890.

"Analysis of Two Samples of Coal for Geo. R. Wells, Esq.

| | "A" | "B" |
|------------------------------------|-----------------|-----------------|
| "Water ----- | 6.70 per cent | 2.55 per cent |
| Volatile carbonaceous matter ----- | 52.89 per cent | 62.01 per cent |
| Fixed carbon ----- | 38.66 per cent | 29.64 per cent |
| Ash ----- | 1.75 per cent | 5.80 per cent |
| | 100.00 per cent | 100.00 per cent |
| Sulphur ----- | 2.49 per cent | 1.81 per cent |

"The sulphur is present in the form of sulphates of lime.

"By the combustion of two samples of coal of 1 pound each, the following quantities of water were evaporated:

"Sample 1—13.86 pounds. Sample 2—12.8 pounds.

"Both samples form a good soft coke.

Thomas Price & Son."

Development:

From 1870, or earlier, to 1922, the Eel River coal deposits have remained practically undeveloped and one may reasonably ask, "Why has a vein of coal, of the size and quality indicated by the surface exposures and analyses, not been developed during all this time, and the coal placed on the market?"

During the '70s, at the time the coal industry of the state reached its maximum development and the coal mines of the Mount Diablo district were in active operation, lack of transportation facilities and distance from market doubtless prevented economic exploitation of the Mendocino County area. Tunnels and other openings made in the early days have been abandoned and have long since caved or been obliterated by landslides. The prominent ledge in the river bed described in early reports has also been eroded away and the outcrop nearly covered with debris brought down by the river during high water.

The production of petroleum in California began about 1874, and the steady growth of the oil industry which has supplied an abundance of cheap fuel, has caused little attention to be paid to California's coal deposits. Most of these have been looked upon from the first as being of inferior quality, and under the circumstances offering but little inducement for the investment of capital.

Furthermore in the Eel River district the most prominent exposures and the greater part, if not all, of the known coal land was covered by

United States patents and included in a tract of 7200 acres, that early passed into the hands of strong financial interests headed by the James L. Flood estate, this tract being known as the Flood Ranch.

The owners of this property have not been particularly interested in developing the coal deposit and for various reasons have made no effort to place their property on a producing basis.

This inactivity on their part has retarded development of the entire Eel River field and it was not until early this year (1923) that a serious effort was made to develop a producing coal mine in this district.

Photo No. 1. Camp and Surface Works. Camp Carbon Coal Mine, Mendocino County, Cal.

Camp Carbon Coal Mine (formerly the Thomas Mine).

This property contains 1040 acres and includes the SE $\frac{1}{4}$ of Sec. 13; the E $\frac{1}{2}$ of Sec. 24; the E $\frac{1}{2}$, the NW $\frac{1}{4}$, and the N $\frac{1}{2}$ of SW $\frac{1}{4}$ of Sec. 25, all in T. 21 N., R. 13 W., M. D. M. At its nearest point it is nearly due south and about 2 miles distant from the coal outcrop in the Eel River at the mouth of Salt Creek. The property extends north and south 2 $\frac{1}{2}$ miles, varying in width from one-half to one mile.

The Eel River coal was traced south of the river soon after the original discovery and an outcrop noted on this property near the center of the section line common to sections 13 and 24. A few prospect holes were dug on section 24 in this vicinity and later, about 1903, a tunnel was run southwesterly for a distance of 70 feet. This tunnel

Photo No. 2. Main entry, looking east. Camp Carbon Coal Mine, Mendocino County, Cal.

was almost entirely in coal, but its direction was practically parallel to the outcrop. After demonstrating the occurrence of a good size vein at this point it was allowed to cave and no further development was attempted pending the opening up of the deposit on the Flood Ranch, nearer the river.

During the past year the latent possibilities of the Thomas property attracted the attention of Mr. A. L. Fisher, 702 Hobart Bldg., San Francisco. After going over the property carefully Mr. Fisher was so impressed with the showing that arrangement was made for its immediate development.

Work was started in February, 1923. Camp Carbon with accommodations for 15 to 20 men was established near the point where the old tunnel had been run, mining and hoisting equipment were brought in, and 7 to 9 men put to work.

The first work consisted in clearing away the debris in the vicinity of the old tunnel and making an open cut so as to clearly define the vein. Although the coal was broken and shattered near the surface, the face of the cut exposed a vein from 12 to 14 feet in thickness, apparently dipping east about 20 degrees.

Photo No. 3. Surface Works and Incline. Camp Carbon Coal Mine, Mendocino County, Cal.

The main entry, 8 feet wide at the bottom, 7 feet at the top and 6 feet high was started here and run east following the dip of the coal. When in about 40 feet it was found that the slope of the incline was too great as it ran into the yellow clay floor underlying the coal. From this point on the grade was gradually flattened to about 10 degrees which is nearer the average dip of the coal so far developed.

At the time of visit on May 1, 1923, the entry was in 95 feet, at which point it was again practically in the center of the vein, there being about 3 feet of coal underneath the car tracks and 3 feet above the top lagging. So far as could be seen there was no parting of shale or other impurities in the coal and no visible pyrite.

The surface drainage in the vicinity of the main entry is toward the north. As the incline runs east it passes under the flow from several springs farther up the hill to the south. Owing to local surface depressions the face of the entry was only a short distance vertically below

the surface and progress was slow on account of the wet ground; heavy timbering and close lagging being required to hold it.

On June 1st the incline had been advanced to 135 feet,¹ and the face of the entry was just beyond the point where the last and largest surface watercourse crosses. For some distance, when under this watercourse, the coal vein was pinched down and averaged only about $4\frac{1}{2}$ feet in thickness, but it began to widen up again after this point was passed. Beyond this watercourse the surface rises more steeply toward the east, and as the entry is advanced the vertical depth will increase much more rapidly.

It is expected that the coal will then become firmer than it was where covered only with a thin, water-soaked and more or less disintegrated shale and sandstone roof. Even in this area portions of the vein are quite solid and if desired chunks of coal a foot in diameter could be obtained by careful mining. Efforts have been confined, however, to advancing the entry as fast as possible and the coal is churn drilled and shot without regard to the condition in which it is recovered.

On June 15th the working force was increased to fourteen men and the mine was being operated two shifts per day. The Camp Carbon coal is of uniform black color. The more solid portions break with a conchoidal fracture, resembling in this respect Cannel coal. It burns with a long flame, produces little ash, and is used at the mine for domestic purposes and operation of the steam hoist with very satisfactory results.

The following is an analysis made by an independent assayer on a sample taken soon after the entry was started:

| | | |
|--------------------------------|--------|----------|
| "Volatile combined matter..... | 54.2 | per cent |
| Fixed carbon | 43.8 | per cent |
| Ash | 2.0 | per cent |
| Coke | 45.8 | per cent |
| Ash in coke..... | 4.56 | per cent |
| B.t.u. (coal) | 13,991 | |

"This coal is classified as sub-bituminous, the percentage of fixed carbon indicating a semi-coking coal of exceptional low ash content. The percentage of fixed carbon is not high but the fuel value is, and it should be excellent for household and industrial purposes."

That portion of the Coast Range containing the Camp Carbon Coal Mine and other Eel River deposits is not included in the areas mapped by the U. S. Geological Survey, and there are no maps available showing in any detail either the areal geology or the topography of this region.

The ground rises at a fairly uniform slope from Eel River to the Camp Carbon property and continues to rise to the south and east from the present mine workings. In the vicinity of the river there is evidence of much faulting and intrusions of metamorphic rocks. Farther south in the vicinity of the Camp Carbon Mine the formations are less disturbed and there is a possibility that the coal may be practically continuous over a large portion of the Camp Carbon Mine acreage.

Until a more detailed study is made it is impossible to definitely correlate this vein with the one exposed in the river. Mr. Fisher believes that the Camp Carbon coal differs from the former in some respects and that it is an entirely distinct vein.

Neither has the age of the Camp Carbon coal been determined. Some fossils were gathered from the overlying sandstone but they were too

¹Since the above was written the entry has been advanced approximately 500 feet. Thickness of vein at face about 12 feet.

imperfect and too few to form a suitable marker for determination. The formations adjacent to the coal, near the river, have been classified as Cretaceous, and there is reason to believe that the Eel River coal measures are of Cretaceous age, in contrast to most of the coal in the state which is generally assigned to the Tertiary (Eocene) Period. Except for a small area of Tertiary rocks near Point Arena, a strip of Cretaceous formations along the coast and small areas of Quarternary deposits along the Russian River, and near Laytonville and Round Valley, the whole of Mendocino County including the Eel River section is shown on the Geological Map of California¹ as Franciscan.

The Camp Carbon Mine has an elevation of approximately 1800 feet and the workings are estimated to be from 700 to 900 feet above the outcrop in Eel River. It is 6 miles southeast of Dos Rios, the nearest railroad point, and $2\frac{1}{2}$ miles by road from the river. There is a good water supply from several springs and fair timber on the property. Climatic conditions are favorable and mining can be carried on the year round without difficulty.

The development to date at the Camp Carbon Coal Mine, upon observation, presents two impressive features: first, that coal of such quantity and quality as the small amount of work already done has shown to undoubtedly exist on the property, could lie undeveloped for so many years; and, secondly, the substantial and (coal) miner-like manner in which it is being opened up and equipped for production.

With the main entry 8' x 7' x 6' high, going in directly on the dip of the vein every foot advance represents a certain tonnage of coal and exploitation is rendered easy and efficient.

Since the completion of the Northwestern Pacific Railroad from San Francisco to Eureka the main transportation problem in this field has been solved. Connection between the railroad and the Camp Carbon Mine can be made readily with a spur track or aerial tramway with downhill trip for the load.

The exceptional quality of the Eel River coal attested by analyses and practical use at the mine; the added possibility that this coal may have valuable coking qualities and the large tonnage that is being shown to exist, marks the opening up of the Camp Carbon Coal Mine as one of the important recent developments in mining in this state.

Camp Carbon Coal Mine is under purchase contract to *Carbon Company*, 312 Henshaw Bldg., Oakland California. A. N. Massey, an experienced coal-mine superintendent, is in charge of operations at the mine.

LOS ANGELES FIELD DIVISION.

W. B. TUCKER, Mining Engineer.

Imperial County.

The California Gypsum Corporation. This company owns extensive deposits of gypsum, located in the Fish Creek Mountains, in Sec. 29, T. 13 S., R. 9 E., S. B. M., about 45 miles northeast of El Centro, in the western part of Imperial County, near the San Diego line.

Active development of these deposits was started early in 1922, and, since the last report made on the property, a crushing and refining plant of 400 tons capacity has been built at the new station at Dun-

¹Geological map of the State of California, California State Mining Bureau, 1916.

away, on the San Diego and Eastern Railroad, a few miles west of Dixieland. A narrow gauge railroad has been built from this point to the mine, a distance of twenty-six miles.

The company is shipping from 200 to 300 tons a day to the Blue Diamond Materials Company, at Los Angeles.

Samuel W. Dunaway is managing director of the company.

Bibliography: State Mineralogist Reports XVIII, p. 421; XIX, p. 31.

Kern County.

Poso Mine comprises 13 claims, located in the Pine Mountains district, in Secs. 30 and 31, T. 27 S., R. 20 E., 22 miles northeast of Bakersfield, on Poso Creek. Elevation 1800 feet.

It was discovered in 1915 by W. H. Fritz, and acquired in 1922 by the Poso Mining and Milling Company of Bakersfield. E. W. McCutchen, president; J. A. Lewis, secretary.

Three parallel veins occur in the granite, striking N. 45° W. and dipping 65° S.W., width 2 to 4 feet. The ore is free milling gold quartz with some hematite and pyrite. It also carries values in silver.

Development consists of a shaft sunk on one vein to a depth of 120 feet on an incline of 70 degrees. From Poso Creek a tunnel is driven on this vein 365 feet to the northwest, connecting with the shaft at a depth of 120 feet. The vein developed in this tunnel shows from 18 inches to 4 feet of oxidized quartz, mineralized with hematite and some iron pyrite. An ore shoot was developed 210 feet from the portal of the tunnel, which was said to average from \$10 to \$12 in gold, with some silver values. Length of pay shoot is 150 feet, with average width of 2 feet. Twenty feet southeast of the shaft the vein is cut by a N. 75° E. fault, dipping 40° S.E., which also cuts off the ore.

This ore shoot has been stoped at intervals above the tunnel level for 50 feet.

Mine equipment: 16-horsepower gas engine hoist, compressor and air drills.

Mill: Blake crusher, 8" x 10"; 5-foot Huntington mill, Wilfley concentrator driven by 37½-horsepower Fairbanks-Morse type Y, semi-Diesel vertical engine.

Five men are employed.

The Tropico Mines, located 5 miles northwest of Rosamond, in Secs. 10, 11, 14 and 15, T. 9 N., R. 13 W., is reported to have been taken over under lease and bond by J. F. White, of Los Angeles. The workings consist of a shaft 300 feet deep, and 2000 feet of drifts.

During the year 1922, the property has been under lease to H. Clifford Burton, of Rosamond.

It is stated that a contract has been let to sink the shaft to the 700-foot level. Owners: Tropico Mining and Milling Co., Rosamond, Cal.

Bibliography: State Mineralogist's Report XIV, p. 512.

of much greater area than the hills, are typical waste-filled interior basins characteristic of the desert. Soledad Peak is about 4000 feet above sea level, and about 1250 feet above the general level of the desert. A number of smaller hills are grouped south of Soledad Mountain. Bowers Hill or Exposed Treasure Butte is about one-quarter of a mile northeast of Soledad Butte and has an elevation of 400 feet above the desert.

Geology: Granite underlies the entire district. There is an exposure on the surface along the northeast flank of Bowers Hill, which extends to the southwest. Rhyolite porphyry lies upon and in contact with the granite, and has by far the greatest exposure of all rocks of the district. Rhyolite occurring in sheets and patches overlies the rhyolite porphyry and forms the summits of several buttes.

The principal veins are on the northern flank of Soledad Mountain, on Bowers Hill, and to the west of Bowers Hill on the desert plain.

The veins that have been worked to any extent on the northern flank of Soledad Butte, occur in the rhyolite-porphyry, and are more or less parallel, their strike being from north to N. 30° W., and dip from 80 degrees to 60 degrees east for a certain depth, where they flatten rather abruptly. The maximum width of the veins is about 12 feet and the minimum width 3 feet. Beginning at the west, the principal and largest veins are the Elephant, Hope, Echo, Gray Eagle, and about one-half mile further east, Queen Esther, Karma and Double Standard veins. All these veins are typical quartz veins, containing quartz and minerals derived from the alteration of the wall rock and deposited in the fissures. The pay ore is more or less irregularly distributed, but it occurs in well defined shoots or lenses, having widths of from 4 to 15 feet, varying in size up to 200 feet along the veins. The gold occurs free, associated with pyrite. The silver occurs as horn silver (cerargyrite), changing to argentite in depth.

On Bowers Hill, there is a series of parallel veins, which have a general north and south strike for a distance, then splitting into numerous branches in a northwesterly direction. These veins dip 60 degrees east for some distance, then flatten rather abruptly to inclinations varying between 30 degrees and 45 degrees, growing flatter with depth, as shown in the lower workings of the Exposed Treasure Mine. Here on the 900-foot level the dip of the vein is only 25 degrees. The wall rock of these veins for a distance is rhyolite-porphyry, and then the veins follow the contact between the granite and rhyolite-porphyry. The vein filling of these lodes is quartz, granite, and calcite, with soft blackish-brown mixture of ferruginous clay and manganese dioxide. The pay ore from 4 to 15 feet in width lies in well defined shoots or lenses, varying in length up to 300 feet. The gold occurs free, associated with pyrite, chalcopyrite, with smaller amounts of galena, marcasite and sphalerite. The silver occurs as horn silver (cerargyrite) and argentite.

The Whitmore and Yellow Dog vein systems are to the west of Bowers Hill on the desert plain. The veins are more or less parallel and strike north to N. 30° W., dipping 45° to 60° E. Widths vary from 3 to 12 feet. These veins occur on the contact of granite and rhyolite-porphyry. The vein filling is similar in character to the Exposed

Treasure vein, consisting of quartz, with massive calcite, and brownish-black ferruginous clay and manganese dioxide.

The approximate production of the district has been over \$3,000,000.*

MINES.

Double Standard, owned by *Mojave Mining and Milling Company*, 261 I. W. Hellman Building, Los Angeles; G. E. Benton, president; A. H. Wollacott, secretary; E. B. Wagemann, superintendent. Consists of 40 acres in Sec. 5, T. 10 N., R. 12 W., S. B. M., 3 miles south of Mojave. Elevation 2700 feet.

The vein occurs in rhyolite-porphyry. It strikes northeast, dips 40° W. and has a width of 3 to 5 feet. The major values are in silver. Workings consist of a shaft 200 feet deep, with levels at 100 and 200 feet. On 100-foot level, a drift 650 feet; on 200-foot level, a drift 850 feet.

Mine equipment consists of hoist, cars, tools, and dwellings. Reduction equipment consists of 5-stamp mill.

In 1919, 55,100 pounds of ore were shipped to the smelter; assay value, gold .87 ozs., silver, 13.30 ozs. Idle.

Echo Group of Mines (Gray Eagle), consists of the following claims: Soledad, Soledad Extension, Echo, Gypsy, Gray Eagle, Gray Eagle Extension, Starlight and Rocky Point, totaling 100 acres, patented, in Sec. 6, T. 10 N., R. 12 W., S. B. M., 4 miles south of Mojave, at an elevation of 3500 feet.

There are three parallel veins on the property, known as the Echo, Starlight and Gray Eagle, which occur in rhyolite-porphyry. The general course of these veins is northwest, and they dip to the northeast. The outcrop of the Echo vein can be traced on the surface for 1800 feet, and throughout its entire length it has a width of 4 feet. The wall rock is silicified rhyolite-porphyry. The gold occurs free, associated with pyrite. The silver occurs as hornsilver (cerargyrite), changing to argentite in depth. The ore shoots in the vein occur in irregular lenses, which have a length of from 100 to 200 feet. The Starlight vein is about 300 feet east of the Echo vein, is parallel to its strike and dips to the northeast. Average width is 3 feet. It is reported that this vein carried a high silver content.

The Gray Eagle vein commences near the northern end of the Starlight vein, diverging from it in a southerly direction, but finally runs parallel to it. The dip is almost vertical and average width about 3 feet. Underground workings: At an elevation of 3200 feet, No. 1 Echo tunnel is driven N. 25° W. 240 feet to the vein, with drifts northwest and southeast on the vein for approximately 500 feet. At an elevation of 3400 feet, No. 2 Echo tunnel is driven southwest on Echo vein for a distance of approximately 500 feet. The ore is stoped to the surface for a length of 240 feet. The vein in these workings shows a width of 4 to 7 feet, the vein material consisting of quartz and silicified rhyolite, stained with iron oxide. At an elevation of 3450 feet, the Gray Eagle tunnel is driven southeast about 450 feet on the Starlight vein,

*Have made use of Chas. E. W. Bateson's report on the Mojave Mining District, in Trans. A. I. M. E., Vol. 37, pp. 160-177, especially in regard vein systems on properties that are idle and workings caved.

then crosscut 40 feet northeast to the Gray Eagle vein, which is drifted on approximately 400 feet, and from this level a shaft has been sunk to a depth of 350 feet, with levels at 100, 200 and 300 feet. On 100-foot level, drifts on vein 510 feet; on 200-foot level, 650 feet; on 300-foot level, 1040 feet. It is reported that a pay shoot 240 feet long was developed on the Gray Eagle vein, the width being from 4 to 15 feet. These veins have been stoped to the surface above the tunnel levels, and also stoped to a depth of 300 feet on the ore shoot. The property was formerly operated by the Echo Consolidated Mining Company, the ore being treated in a 10-stamp mill, which plant was dismantled in 1906. Reported to have a production record of \$200,000. Owners, A. Asher and Bert Fisher of Mojave.

Elephant Group of Mines consists of the following claims: Mountain View, Excelsior, Elephant, Hope, Extension, Elk and Charity, approximately 100 acres, located in Sec. 6, T. 10 N., R. 12 W., about 5 miles south of Mojave, at an elevation of 3000 feet.

Owned by *United Mines Company*; Ward Perry, president; H. F. Benecke, vice president; Mr. McClellen, secretary, Chicago, Ill. Under lease to H. F. Benecke, H. F. Hickman, and M. L. Oliver of 160 Santa Fe Ave., Los Angeles.

Three roughly parallel veins, known as the Hope, Excelsior, and Elephant, have been developed on the property. They have a general northwest strike, with dips varying from 50 degrees to 80 degrees to the northeast. These veins occur in silicified rhyolite-porphry. The vein material is highly brecciated, containing quartz and included silicified porphyry, which is stained with iron oxide. The veins vary in width from 3 to 7 feet. Workings on the Elephant vein consist of a shaft 120 feet deep, sunk on incline of 75 degrees, with levels at 50 and 100 feet. On 50-foot level, drift southeast 60 feet. On 100-foot level, drift southeast 350 feet, and drift to northwest 210 feet. On the 100-foot level, in drift to southwest, the vein has been stoped to the surface for a distance of 120 feet. It is reported that ore from these workings had a value of \$25 to \$200 per ton.

The development at present is confined to the Excelsior vein, on the northwest slope of Soledad Mountains, at a distance of 1800 feet west of the Elephant shaft. The ore is trammed from Excelsior tunnel to the mill below Elephant shaft. The Excelsior vein is developed by a crosscut tunnel driven N. 30° E. 100 feet. At 20 feet from the portal it cut the vein which is drifted on northwest 100 feet.

North of these workings, a number of shafts have been sunk on the vein to depths of 50 to 100 feet. The vein is 3 feet wide. About 200 feet southeast of Excelsior tunnel, the Hope vein is developed by two tunnels, the lower tunnel is driven on the vein to the north 400 feet. At 160 feet from the portal it cut an ore shoot about 100 feet in length, which has been stoped to the surface. The vein has an average width of 3 feet. Mine equipment consists of 25-horsepower electric hoist and Rix compressor. Mill consists of 25-ton Herman ball mill, driven by 25-horsepower motor, and amalgamating plates. Ore being milled comes from the Excelsior tunnel. Three men are employed. M. L. Oliver, superintendent.

Exposed Treasure and Desert Queen Mines, the largest producer in the district, consists of the following claims: Last Chance, Black Tiger, Revenue, Exposed Treasure, Extension, Gulch Extension, Accident Gulch, Wedge, Outlook, Yellow Rover, Golden Carrier, Boston, Boston Extension, Desert Queen, Hobson and Camp Bird, located in Sec. 32, T. 11 N., R. 12 W., about $3\frac{1}{2}$ miles south of Mojave on Bowers Hill. Holdings comprise 280 acres of patented ground, and 60 acres held by location, owned by the *Standard Mining and Milling Company*, Grosse Building, Los Angeles; W. E. Goodyear, president; James Westerfeldt, secretary; W. H. Thorpe, general manager. The property was acquired in 1921 by the present owners from the *Mojave Consolidated Gold Mines Company*, who operated the property until 1915. Seven parallel veins have been developed on the property known as the Mill, Assay Office, Golden Carrier, Yellow Rover, Boston, Exposed Treasure, and Desert Queen. The most productive have been the Exposed Treasure, Desert Queen and Yellow Rover veins. The most extensive development work has been confined to the Exposed Treasure and Desert Queen veins. These veins have a general north and south strike, but split into numerous branches which strike N. 30° W. The veins near the surface have a dip of 60 degrees for a certain distance, then flatten to inclinations varying from 30 degrees and 35 degrees, growing flatter with depth, as the Exposed Treasure vein on the 900-foot level has a dip of only 25 degrees to the northeast. The veins have widths varying from 4 to 15 feet. Workings consist of shafts on the different veins. On the Exposed Treasure vein an incline shaft has been sunk to a depth of 900 feet with levels at intervals of 100 feet, with over 10,000 feet of drifts and stopes. The Exposed Treasure shoots of ore trend to the north. The vein has been stoped from the 600-foot level to the surface, the pay shoots being from 100 to 600 feet in length, with widths varying from 4 to 15 feet. On the 900-foot level, a shoot of ore has been developed, 7 feet wide, which shows some very high grade ore, carrying free gold. There is a probability of developing a considerable tonnage of ore from the 900-foot level to the 600-foot level, that will average about \$10 to \$12 per ton.

On the Yellow Rover vein an incline shaft has been sunk to a depth of 340 feet, with levels at 100, 200, and 300 feet.

This vein is from 4 to 15 feet wide, and is said to have produced some high grade ore.

On the Desert Queen vein, a shaft has been sunk to a depth of 400 feet on a 70 degree incline, with levels at 100, 200, 300 and 380 feet. At the 100-foot level, the vein flattened; on the 200-foot level, it was cut 20 feet east of the shaft; on the 300-foot level, 100 feet east of the shaft; on the 400-foot level, 180 feet east of the shaft. The vein has an average width of 3 feet, with granite footwall and rhyolite-porphry hanging wall. The present development work has been confined to the Desert Queen shaft, where electric pumps were installed, and the mine unwatered. At a depth of 380 feet in the Desert Queen shaft, a crosscut has been driven west 800 feet, cutting the Boston vein at 100 feet, Yellow Rover vein at 510 feet, Golden Carrier vein at 590 feet, Assay Office at 630 feet and Mill vein at 800 feet from the shaft. It is expected that the Exposed Treasure vein will be crosscut between 800

and 900 feet, at a depth of 135 feet below the 900-foot level of Exposed Treasure Mine. The present crosscut has drained the Exposed Treasure workings, and when the Exposed Treasure vein is cut, it is proposed to raise on the vein connecting with the 900-foot level north of the shaft. The Mojave Consolidated Mines Company was compelled to suspend operations on the property in 1915, due to the large amount of water encountered on the lower levels of the Exposed Treasure Mine, as with the steam equipment then on the property, they could not handle the water.

The installation of an electric power line, which crosses the district, by the Southern California Edison Company, has enabled the present company to install electric pumps which will enable them to handle the water, and develop the ore shoot discovered on the 900-foot level.

Mine equipment consists of 30-horsepower electric hoist (10 $\frac{1}{4}$ " x 10"), Ingersoll Rand compressor (16 $\frac{1}{4}$ " x 10"), air drills, five Byron-Jackson pumps driven by electric motors, machine shops, assay office and dwellings. Reduction equipment consists of two Blake crushers, 60-ton cyanide plant (nine sand vats, and three slime agitators). The original 20-stamp mill has been dismantled and sold. Water is secured from the Tehachapi Mountains, a distance of 18 miles, through the Soledad pipe line, which is owned by the company. It is stated that in previous operations the ore milled averaged \$12 to \$15 per ton, but the recovery was low.

Fifteen men are employed. Production record to date is about \$2,000,000.

Bibliography: Transactions Am. Inst. Min. Engineers, Vol. XXXVIII, pp. 310-319; Report XIV, State Mineralogist, pp. 504-505.

Karma Mine, owned by E. L. Wegmann of Mojave, comprises the following claims: Karma, Ajax, Intension, Junction, totaling 70 acres, located in Sec. 6, T. 10 N., R. 12 W., about 4 miles south of Mojave, at an elevation of 3200 feet. Two parallel veins have been developed on the property. The outcrops can be traced on the surface for a distance of 1000 feet. They vary in width from 4 to 15 feet. The general course of the veins is north, dip 60 degrees east, with silicified rhyolite-porphry walls. The vein is sugary quartz, stained with iron oxide. It is reported the pay-shoot was 240 feet in length, and 15 feet wide. A high grade streak of ore occurs along the hanging wall. The gold is free with a small percentage of pyrite. Workings consist of a tunnel 1800 feet long on the vein, shaft 160 feet deep, drifts and stopes.

Mine equipment consists of cars, assay office, shops and dwellings. Reduction equipment: Old 20-stamp mill, 850-lb. stamps.

Water is secured from the Soledad pipe line, owned by the Standard Mining and Milling Company.

Property was worked by Karma Mining Company, from 1898 to 1904. Purchased by E. L. Wegmann, in 1918. Since that date, the property has been under development, and it is reported a large tonnage of ore has been developed. Idle.

Bibliography: Report XIV, State Mineralogist, p. 499.

Queen Esther Mine is one of the large producers of the district, which was operated from 1894 to August, 1910, when operations were suspended. The property has been idle since that date. The production in gold is reported to have been about \$200,000.

Holdings consist of the following claims: Regina, Mojave Bonanza, Tip Top, Independent, Calcium, Queen Esther, Rex, Regent, McBrayer, Sailor Boy, totaling 160 acres, located in Sec. 6, T. 10 N., R. 12 W., 4 miles south of Mojave, at an elevation of 3200 feet.

Owners, *Queen Esther Mining and Milling Company*, Pacific Mutual Building, Los Angeles. Seeley W. Mudd, president; A. A. Barnard, secretary.

The Queen Esther vein runs nearly north and south. It dips 40 degrees to the east. The vein has a width of 4 to 8 feet, and at places attains a maximum width of 12 feet. The vein rolls or folds as it gains in depth. These folds dip along the vein about 10 degrees to the north. The vein is filled with brownish colored quartz. The country rock is silicified rhyolite-porphry. Underground workings consist of several tunnels on the vein, 500 feet in length, with several thousand feet of drifts. Some of the ore contained considerable silver. The pay-shoot worked is reported to have been 500 feet in length, with an average width of 8 feet. Mill was dismantled in 1918.

Bibliography: Report XIV. State Mineralogist, p. 508.

Gold Coin Group, consists of the following claims: Gold Coin, Gold Coin No. 1, and Victor No. 1, located in Secs. 31 and 32, T. 11 N., R. 12 W., 3 miles south of Mojave. Owners, *New Tonopah Dividend Mining Company*, Tonopah, Nevada. J. R. Cunningham, president; E. P. Cullinan, secretary and manager.

The property is located west of the Yellow Dog Mine on the flat, at an elevation of 2700 feet. The company is sinking a prospect shaft in granite wash with the hope of developing a parallel vein to the Yellow Dog vein. The present depth of the shaft is 180 feet, and it is still in granite wash.

Four men are employed.

Whitmore Mine consists of 10 claims known as: Whitmore No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, No. 7, Whitmore Extension, Antique, Antique Extension, and Valley, approximately 160 acres, located in Sec. 32, T. 11 N., R. 12 W., at an elevation of 2700 feet, $3\frac{1}{2}$ miles south of Mojave. This group of claims lie between the Exposed Treasure and Yellow Dog mines.

Owners, W. K. Whitmore and J. E. Whitmore of Mojave. The principal development work has been confined to Whitmore No. 1, No. 2, No. 3, and No. 7 claims.

The property was operated in 1912 by the *St. Mary Mining Company* of Arizona. It was later acquired by the present owners.

Four parallel veins occur along a series of roughly parallel rhyolite-porphry flow dikes. The general course of these porphyry dikes is N. 30° W. and dips 60 degrees east. The veins strike north, to N. 30° W. and dip 60 degrees east. Their widths vary from 2 to 6 feet. On Whitmore No. 1 claim, a shaft has been sunk on the most westernly vein to a depth of 300 feet, on an incline of 75 degrees, with levels at

100 and 200 feet. On the 100-foot level, the vein has been drifted on north 165 feet, and south 60 feet. On the 200-foot level, north 160 feet, and south 120 feet. This shaft was sunk on the vein for a distance of 225 feet, then vertical for 75 feet, in the footwall. At the 270-foot depth a crosscut was run 70 feet east to the vein. The vein has rhyolite-porphyry footwall and granite hanging wall. The vein developed on these two levels has an average width of 3 feet, and is reported to carry values in gold and silver of from \$6 to \$50 per ton. Whitmore No. 3 shaft is 400 feet southeast of No. 2 shaft and is an incline shaft 100 feet deep. The vein developed is from 2 to 4 feet in width, and reported to have a value of \$20 per ton in gold. The ore is free milling, containing some pyrite.

Equipment consists of 6-horsepower Fairbanks-Morse gas engine hoist, compressor, 10" x 10", driven by 32-horsepower Fairbanks gas engine, shops and dwellings. Two men are employed on development work.

Yellow Dog Mine consists of the following claims: Yellow Dog No. 1, No. 2, No. 3, No. 4, No. 5, No. 6, Francis H. and Francis H. No. 1, totaling approximately 160 acres, located in Secs. 29, 32, T. 11 N., R. 12 W., 3 miles south of Mojave. Owners, Yellow Dog Mining Company. L. L. Patriek, president; Walter B. Kibby, secretary; Sol Camp, superintendent. Offices, 803 H. W. Hellman Building, Los Angeles.

During the early part of 1922, Mr. Percy Wegmann of Mojave discovered an outcrop of quartz carrying free gold on this group of claims. The above-mentioned claims were located by P. Wegmann, J. Withers, and Bert Fisher of Mojave, and were afterwards acquired by the present company. This discovery of high grade gold ore is the most important made in the district in recent years, and has caused a revival of interest in the opening and development of other properties in the district. The vein strikes north and dips about 60 degrees to the east. Has an average width of 10 feet, and a maximum width of 15 feet. The high grade gold quartz occurs on the hanging wall, with a vein of spar from 6 to 8 feet wide heavily stained with manganese on the footwall. The vein occurs on the eastern slope of a small butte of rhyolite-porphyry, and has a rhyolite-porphyry footwall with granite hanging wall. It is reported that samples taken from the spar vein will average \$3 per ton, while the average value of samples from 4 feet of vein quartz was better than \$25 per ton in gold.

Developments: At an elevation of 2800 feet, a shaft has been sunk on an incline of 60 degrees to a depth of 275 feet, with levels at 100 and 200 feet. On the 100-foot level, the vein has been drifted on 272 feet north and 100 feet south. On this level, an ore shoot was cut 150 feet north of the shaft, which is developed for a distance of 120 feet, the vein having an average width of 12 feet. It is said to average \$25 per ton. On the 200-foot level there is a drift north 150 feet, and south 200 feet. Besides this shaft, a number of shallow shafts have been sunk to depths of 60 feet along the vein, both north and south of the main shaft. South of the shaft the vein is faulted about 20 feet to the west by a fault which strikes N. 60° W.

Equipment consists of 15-horsepower electric hoist, Chicago pneumatic compressor (10" x 12") driven by 50-horsepower motor. Water

is secured from the Soledad pipe line, owned by the Standard Mining and Milling Company. Electric power is secured from the Southern California Edison Company. Eight men are employed.

Yellow Dog Extension Mine comprises five claims, known as: Liberty, Victory, Bull Moose. Bull Moose No. 1 and No. 2, Bull Moose Fraction, totaling 100 acres, located in Sec. 33, T. 11 N., R. 12 W., 3 miles south of Mojave. Elevation 2800 feet. Owners, Yellow Dog Extension Mining Company, 308 H. W. Hellman Building, Los Angeles. E. M. Brown, president; Luther Emery, secretary; C. L. Putnam, manager.

The company also has under lease from the Standard Mining Company a section of ground 600 feet by 447 feet. The property is located on the east slope of Bowers Hill, to the east of the Standard Mining and Milling Company property.

Two parallel veins have been developed on the property, the most prominent being the Russian Boy vein. These veins strike N. 30° W., and dip 45 degrees east. The company is sinking a 2-compartment vertical shaft to a depth of 200 feet, also driving a cross-cut on the 100-foot level to develop the Russian Boy vein. This vein is expected to be cut by the shaft at a vertical depth of 200 feet. At an elevation of 2850 feet, a tunnel has been driven on the Russian Boy vein N. 35° W., 150 feet. The vein has a width of 6 feet. A shoot of ore was developed about 75 feet in length, with an average width of 6 feet, which has been stoped to the surface throughout its length. The country rock is granite and rhyolite-porphry. The vein filling is quartz and calcite stained with manganese and iron oxide. Quartz shows free gold associated with pyrite.

Equipment: 7-horsepower gas engine hoist, truck, shops and buildings. Five men are employed.

Los Angeles County.

Chicago-Pacific Clay Deposit. This deposit is located in the range of hills north and south of Soledad Canyon, in Secs. 8, 9, 15, 16, and 17, T. 4 N., R. 14 W., M. D. M., 11 miles east of Saugus and one-quarter of a mile north of Lang Station, on the Southern Pacific Railroad.

Holdings consist of 13 claims, 7 in the Pacific group and 6 in the Chicago group.

It is a massive deposit of white metamorphic granite (quartz-feldspar rock) containing high aluminum content, which, according to the analysis, should probably be satisfactory for the manufacture of fire brick and certain kinds of pottery. The low iron content of the rock suggests its use for high grade Portland cement, and it also might be used as a paint filler.

The general strike of the formation is east, and it can be followed from Lang to Alpine Siding on the Southern Pacific Railroad, a distance of two miles. It is about two miles in width and occurs on a contact with schist, which lies to the south of the granitic rock.

The following is an analysis of the material made by the C. W. Hill Company of Los Angeles:

| | |
|------------------------|--------|
| Moisture ----- | 0.10% |
| Loss in ignition ----- | 0.55% |
| Silica ----- | 58.10% |
| Alumina ----- | 28.27% |
| Ferric oxide ----- | 1.03% |
| Lime ----- | 8.60% |
| Magnesia ----- | 0.54% |
| Potash ----- | 1.60% |
| Soda ----- | 0.82% |
| Total ----- | 99.61% |

Owners, J. P. Monahan and J. G. Kronn, 322 Homer Laughlin Building, Los Angeles.

Ramelli Dolomite Deposit. The deposit is located on the west slope of the San Gabriel Mountains, in Sec. 17, T. 3 N., R. 15 W., M. D. M., 4 miles northeast of San Fernando. Elevation 2200 feet. Holdings consist of two claims, 40 acres.

A stratum of white crystalline dolomite occurs in the granite, with a general easterly and westerly course, and dip 45 degrees to the north. The exposure is from 200 to 500 feet in width and it can be traced for the full length of the two claims.

Owners, Frank Ramelli and Edward Oviatt of Van Nuys.

Orange County.

Silverado Mine. It is situated in Silverado Canyon, 20 miles east of Santa Ana. The property was formerly owned by the *Blue Light Mining Company* of Los Angeles, and has been recently acquired by a group of Orange County men, with Stanley Chapman of Fullerton as the largest stockholder.

The officers of the new company are as follows: Charles Eygabroad, president; Stanley Chapman, vice president; Sam Collins, secretary, and O. H. Pember, superintendent.

The present company plans to enlarge the 50-ton flotation plant. Thirty men are employed on development work.

The ore is silver-bearing galena, associated with zinc-blende and pyrite, and the vein is from 2 to 4 feet wide.

Bibliography: State Mineralogist's Report XVII, p. 323.

San Bernardino County.

RANDBURG DISTRICT.

The silver-bearing region of this district continues quite active, although a number of the smaller companies have suspended operations, due to the completion of the Pittman Act and the present price of 62 cents for silver. There are still a number of companies vigorously prosecuting development work on their holdings.

There has been a noticeable revival of interest in the gold mines of the district, and active development work has been started on a number

of properties that have long lain dormant; the outstanding features being the discovery of high grade gold ore on the Silver Basin group, and the development of a new shoot of ore on the Black Hawk, west of the Blue fault, on the 100-foot level of the Black Hawk Mine. The shoot is 65 feet long, with an average width of 3 feet. It is reported to have an average value of \$50 per ton in gold. The find is important as it opens up new territory on the property, as nearly all previous production came from east of the Blue fault.

MINES.

Big Gold Mine consists of the following claims: North Star, Lucky Strike, Neglected, Kenneth B. Fraction, totaling 74 acres, located in Secs. 3 and 4, T. 30 S., R. 40 E., 3 miles southwest of Randsburg. Elevation 3800 to 4000 feet. Owner, E. Spillane of Randsburg, under option to Big Gold Mines, Inc. W. Roland, president; Guy Jones, secretary; S. L. Pearce, manager. The property is located on the north-west slope of the Rand Mountains, and adjoins the Minehaha Mine on the west.

The country rock is granite and schist. A series of parallel north and south quartz veins occur in the schist, and there is also an east and west system of veins that intersect the north and south veins.

The principal development work has been confined to the Big Gold vein, which occurs on a fault fracture, on the contact of granite and schist. This vein has a course of N. 20° W. and dip of 40 degrees east. Its average width is 4 feet. The quartz carries free gold, and a small percentage of pyrite. The croppings of the vein are prominent and can be traced for a distance of 3000 feet.

Mine workings consist of a 2-compartment vertical shaft 385 feet deep. The shaft intersected the vein on the 155-foot level, and the vein has been drifted on 200 feet south, and 30 feet north on this level. Above the 155-foot level the vein has a granite hanging wall and schist footwall, and below this level the hanging wall is rhyolite-porphyry, with schist on the footwall. A rhyolite-porphyry dike 25 to 50 feet in width was cut in the shaft on the 155-foot level, which strikes N. 20° W. and dips 40 degrees east, forming one wall of the vein. A winze has been sunk on the vein from the 155-foot level to a depth of 105 feet. South of the shaft, the different veins have been developed by a number of tunnels from 50 to 100 feet in length.

Mine equipment: Consists of 6-horsepower Fairbanks-Morse gas engine hoist, 2-drill compressor, air drills, and blacksmith shop. Six men are employed.

Black Hawk Mine (gold and silver) consists of the following claims: Lassen, Shasta, One-Track, Gray Eagle, Two-Track, O. K. No. 1 and No. 2, Black Hawk and Wedge, totaling 130 acres. Property was discovered in 1896, and operated by D. A. B. Blue until 1921, when it was purchased by the *Pittsburg Mount Shasta Mining and Milling Company*, J. J. Schneider, president; T. V. Scott, secretary, and D. F. McCormick, manager. J. O. Grenan is superintendent. Offices, 516 Federal Building, Pittsburg, Pennsylvania.

The present company started operations February 21, 1923, and the property has been under continuous development to date.

The 5-stamp mill on the Black Hawk Mine has been remodeled, and has been operating continuously on ore from the mine. On the Shasta Claim, at an elevation of 3570 feet, the company is sinking a 2-compartment vertical shaft, its present depth being 700 feet. This shaft is located 2500 feet south of the California Rand Silver Mining Company's main shaft, and 1000 feet south of the Bray-Bisbee shaft on the Rand Silver King group.

The shaft was sunk 140 feet through Lake Bed formation to schist, and in the schist it cut a number of N. 30° E. fissures which dip 60 to 65 degrees northeast. These fissures are filled with quartz and calcite, mineralized with pyrite, and some stibnite.

In the Black Hawk Mine a new shoot of ore west of the Blue fault has been developed on the 100-foot level. The shoot is 65 feet in length, with an average width of 3 feet, and is said to average \$50 per ton in gold.

Three parallel quartz veins occur in the schist, with general north strike and dip 50 degrees to the east. Width of veins 18 inches to 3 feet. Free milling gold quartz; value \$7 to \$50 per ton.

Developments: Black Hawk shaft 250 feet, with levels at 50 feet, 100 feet, 200 feet and 4000 feet of drifts and crosseuts on the Black Hawk vein. Pittsburg shaft 700 feet vertical. Bevis Divide shaft, 160 feet.

Electric power is secured from the Southern Sierras Power Company.

Mine equipment: At the Black Hawk shaft, 20-horsepower direct connected electric hoist. At the Pittsburg shaft, 50-horsepower electric hoist, and 12" x 10" compressor. At the Bevis Divide shaft, 25-horsepower electric hoist.

Mill equipment: 5 stamps, weight 1000 pounds. The ore is crushed through 40-mesh, followed by amalgamation. Fifteen men are employed.

Bibliography: Report XIV, State Mineralogist, p. 489.

California Rand Silver, Inc. Alfred Harrell, president; Charles S. Meroney, general manager; controls 21 claims, with a total area of 240 acres in the Rand Mining District. The property has been a steady producer since its discovery in April, 1919.

The capacity of the mill has been lately increased from 150 tons to 200 tons per day. During the month of May, the mine produced 7800 tons of milling ore, and 1034 tons of ore were shipped to the smelter. The mill produced 680 tons of concentrates, with an average value of \$288.83 per ton. The total smelter returns for the month were \$283,-298.51. The regular monthly dividend of 10 cents per share, a total of \$153,600, has been distributed to the stockholders of the company. Since the property has been in operation, it has paid in dividends \$2,553,600.

Mizpah-Montana Mine consists of the following claims: Mizpah Extension and Montana-Fraction, approximately 20 acres located in Secs. 1 and 6, T. 30 S., R. 40 and 41 E., 1½ miles southeast of Randsburg. Elevation 3800 feet.

Owners, Mizpah-Montana Mining Company, Hopkins Building, Bakersfield. Herman T. Miller, president; Frank Smith, secretary; G. Cleveland Taylor, superintendent.

The country rock is granite and schist. Two parallel veins, which strike N. 60° and dip 60 degrees southeast, occur in the granite on the

Mizpah Extension claim. Width of veins is from 8 to 12 inches. A 2-compartment shaft has been sunk to a vertical depth of 700 feet. The shaft is in granite for a distance of 400 feet, at which point it cut the schist.

Levels were driven at 102, 166, 236, 493 feet. On 100-foot level there is a drift north 80 feet, and south 80 feet; on the 200-foot level, a drift southeast 80 feet; on the 500-foot level, a drift west 260 feet, and east 100 feet. On the 100-foot level the drift cut a north and south fracture in the granite, which showed some ruby silver. On the 500-foot level in the east drift a well-defined fracture was cut which strikes N. 40° E. and dips 60 degrees east. The vein material in this fracture is brecciated and mineralized with pyrite and stibnite. Width of mineralized schist is from 4 to 8 feet. The company has an option on the Cuve claim, and it is proposed to develop this property from the 700-foot level.

Mine equipment consists of 50-horsepower electric hoist, 12" x 10" Ingersoll-Rand compressor, driven by 50-horsepower motor, air drills, cars and blacksmith shop. Eight men are employed.

Mizpah-Nevada Mine consists of New, Spider, Fraction, and Mistake claims, located in Secs. 1 and 6, T. 30 S., R. 40 and 41 E., 1½ miles southeast of Randsburg. Elevation 3850 feet. Owners, Mizpah-Nevada Mining Company, 314 Hopkins Building, Bakersfield. M. F. Pearson, president; F. J. Burns, secretary; G. Cleveland Taylor, manager.

Three parallel quartz veins occur in the granite. They strike N. 60° E., and dip from 75 degrees to vertical. Widths are 6 to 12 inches. Development consists of vertical 2-compartment shaft 150 feet deep and crosscutting on the 150-foot level to develop veins exposed on the surface east of the shaft. The company is planning to sink the shaft an additional 150 feet to cut the schist.

Mine equipment consists of 6-horsepower Fairbanks-Morse gas engine hoist, air drills, cars and blacksmith shop. Air is secured from the Silver Moon Mining Company. Four men are employed.

Rand Contact Mine comprises the following claims: Inyo, Body, American and Limestone, approximately 80 acres, located in Secs. 7, 12, 13 and 18, T. 30 S., R. 40 and 41 E., 3 miles southwest of Johannesburg. A quartz vein occurs on the contact of the schist and granite, striking northeast and southwest and dipping 45 degrees to southeast. Width is 12 inches to 2 feet. Development consists of 2-compartment vertical shaft sunk to a depth of 100 feet. A crosscut is being driven on the 100-foot level to the southeast to intersect the contact. Two parallel faults occur north and south of the shaft, which strike N. 45° W. and dip 70 degrees northeast, intersecting the contact to the southeast of the shaft.

Equipment consists of 10-horsepower Fairbanks-Morse gas-engine hoist, cars and blacksmith shop.

Owners, Rand Contact Mining Company, 506 S. Hill Street, Los Angeles. S. G. Dixon, president; L. A. Shaftner, secretary; Dr. M. A. Varichey, vice president; E. G. Dixon, manager. Four men are employed.

Silver Basin Mine (Gold). Formerly known as *Golden Era* group, consisting of the following claims: *Golden Era*, *Hidden Treasure*, *Ransome*, *O'Farrell*, *Fraction*, *Mandan Fraction*, *Y. W. Fraction*; 60 acres, located in Sec. 7, T. 30 S., R. 41 E., $2\frac{1}{2}$ miles southeast of Randsburg. Elevation 3600 feet.

Owners, *Silver Basin Mining Company*, Bakersfield. Kent S. Knowlton, president; Ray Woods, secretary; Leonard Lohr, manager.

Two parallel quartz veins occur in the schist, striking northwest and dipping 70 degrees northeast. Width is 12 inches to 3 feet.

The quartz is stained with iron oxide, and shows free gold.

Developments: *Hidden Treasure* shaft, 240 feet; *Golden Era* shaft, 50 feet. Present work is confined to the *Golden Era* vein. Here the vein prospects well in gold, and samples taken from shafts sunk along the vein for a distance of 100 feet, are said to have given values of from \$50 to \$150 per ton in gold. The company recently purchased the equipment of the *Ben Hur Company*, and are planning to sink the present *Golden Era* shaft to a greater depth. Six men are employed.

Silver Belle Mine comprises the following claims: *Silver Belle* and *Silver Belle No. 1*, approximately 20 acres, located in Sec. 6, T. 30 S., R. 41 E., 2 miles southeast of Randsburg. Elevation 3800 feet.

Owners, *Silver Belle Mining Company*. Edward Burge, president; N. R. Solomon, secretary; C. E. Pearce, superintendent. Property was under continuous development during 1921 and 1922 but operations were suspended in July, 1923. Development consists of 2-compartment vertical shaft 700 feet deep, with two levels, one at 500 feet, and the other at 700 feet. Crosseuts were driven 400 feet west on the 500-foot level, and 300 feet east on the 700-foot level. This shaft was sunk northwest of the Big Dike fault, in hopes of developing ore which occurs on the north and south, and N. 40° E. fractures of the California Rand Silver Mining Company's property. On the 500-foot level a series of north and south fractures were cut in the schist, which were mineralized with pyrite and stibnite with small values in gold and silver.

It is reported that the company plans to resume operations at an early date and is planning to sink the present shaft to a depth of 1000 feet.

Silver Glance comprises 10 acres on the *Silver King* group of claims, under lease to the *Silver Glance, Inc.*, of Bakersfield. E. J. Emmons, president; S. L. Pearce, secretary and manager.

The property is located southeast of Osdick on the western slope of Red Mountain. Development consists of 2-compartment vertical shaft, 250 feet deep. The company plans to sink this shaft to a depth of 700 feet, which is the probable distance that the shaft will have to be sunk through the Lake Beds formation to cut the schist.

The shaft is located about 1000 feet northeast of the *Silver King* shaft in which some high grade silver ore was developed.

Equipment consists of 6-horsepower gas engine hoist. Six men are employed.

South Rand (Gold) comprises the Igo claim and 80 acres of patented land, located in Sec. 16, T. 30 S., R. 40 E., 6 miles south of Randsburg, on the southeast slope of Rand Mountains. Elevation 4200 feet.

Owners, South Rand Mining Company. E. L. Burton, president; S. L. Pearce, secretary and manager.

Two parallel quartz veins occur in schist. They strike east and dip 45 to 60 degrees south. Widths are 12 inches to 2 feet.

Development consists of shaft 60 feet deep, and tunnel 50 feet in length, with winze 30 feet deep on the vein. The company is sinking a shaft on one of the veins, and proposes to sink to a depth of 300 feet before drifting on the vein.

Equipment consists of 12-horsepower gas-engine hoist, blacksmith shop and cars. Three men are employed.

St. Lawrence Rand Mine comprises 180 acres, located in Sec. 1, T. 30 S., R. 40 E., 2 miles southeast of Randsburg. Elevation 3680 feet.

Owners, *California Rand Silver, Inc.*, under lease to the St. Lawrence Rand Mining Company, Land Building, Bakersfield; M. A. Dular, president; E. H. Richards, secretary.

Two parallel quartz veins occur in the schist. They strike N. 70° E. and dip 65 degrees south. Widths are 12 inches to 4 feet. The vein filling is quartz, calcite, and mineralized schist; the minerals contained being pyrrargyrite, stephanite, cerargyrite, stibnite and pyrite, with some gold values. Two shafts have been sunk on the K. C. N. vein; No. 1 shaft being 275 feet deep on an inclination of 67 degrees. No. 2 shaft is an incline shaft 300 feet deep. The present development work is confined to No. 1 shaft. Levels have been driven at 100 feet, 200 feet and 240 feet. On the 200-foot level there is a drift 250 feet east, and 40 feet west; on the 240-foot level, a drift 250 feet east, connecting with No. 2 shaft. On the 240-foot level about 230 feet east of the shaft a shoot of ore has been developed 40 feet in length with average width of 4 feet. A winze has been sunk on this shoot to a depth of 50 feet. Smelter returns from 6000 pounds of ore from this ore body were \$75 per ton in gold and silver. Samples taken from the vein are said to have an average content of 20 ounces in silver with \$5 in gold.

Mine equipment consists of 35-horsepower electric hoist, 12" x 10" Ingersoll-Rand compressor driven by 75-horsepower motor, blacksmith shop, air drills and cars. Ten men are employed.

Treasure Hill Mine comprises one claim known as Treasure Hill, located in Sec. 1, T. 30 S., R. 40 E., 1½ miles southeast of Randsburg. Elevation 3750 feet.

Owners, Treasure Hill Mining Company, Bakersfield. Frederic Downer, president; George Rutherford, secretary; C. E. Lucas, manager.

Two quartz veins occur in the schist; one strikes N. 30° E. and the other N. 55° E., and dip 60 degrees southeast. Widths are 12 inches to 2 feet. The company is sinking a vertical 2-compartment shaft, present depth 485 feet, and is planning to sink to a depth of 600 feet before starting a level. It is reported that at a depth of 400 feet a mineralized vein 6 feet in width was cut which strikes N. 40° E. Samples taken from the vein showed \$3 to \$5 in gold. At a depth of 480 feet the shaft cut a north and south fracture, which was filled with quartz and calcite and mineralized with pyrite. Samples taken are reported to assay from \$5 to \$20 in gold.

Mine equipment: 20-horsepower gas-engine hoist, blasksmith shop, air drills, and cars. Air is secured from Silver Moon Mining Company. Eight men are employed.

United Mines, Inc. (Gold) has a bond and lease on the *Bully Boy* group of claims, totaling 110 acres, located in Secs. 11 and 12, T. 30 S., R. 40 E., 2 miles south of Randsburg. Elevation 4150 feet. Operating company is known as United Mines, Inc.; C. R. Hannaman, president; M. J. McVan, secretary; S. L. Pearce, manager.

During the year 1922, the property was operated by the *Nugget Gold Mining Company*, but it was acquired by the present company in July, 1923. A series of parallel narrow quartz veins occur in the schist. Strike is N. 40° E. and dip 50 degrees northeast. Widths are 6 to 12 inches. A number of shafts have been sunk on the different veins from 50 to 100 feet. The main working shaft has been sunk on an incline of 53 degrees to a depth of 100 feet, on the *Bully Boy* vein. On the 50-foot level there is a drift west 150 feet on the vein; on the 100-foot level, a drift west 50 feet. About 150 feet west of this shaft there is an incline shaft on the vein to a depth of 60 feet, and about 250 feet west of this shaft is another shaft 170 feet deep. The area between these two shafts has been stoped to a depth of 60 feet, at which point the ore was cut off by a horizontal fault.

Mine equipment consists of a 60-horsepower West Coast gas-engine hoist, 10" x 10" Chicago pneumatic compressor, blacksmith shop and mine dwellings. Four men are employed.

White Horse Mine comprises the following claims: White Horse and High Grade Ridge, totaling 11 acres, located in Sec. 1, T. 30 S., R. 40 E., 2 miles southeast of Randsburg. Elevation 3550 feet.

Owners, White Horse Mining Company, Selma, California. A. Sager, president; C. Campbell, secretary; S. L. Pearce, manager.

Two parallel quartz veins occur in the schist northeast of the shaft. They strike N. 30° E., and N. 55° E. and dip 50 degrees southeast. Widths are 12 inches to 2 feet. Six shafts have been sunk on these two veins to depths of 40 to 50 feet. The company is sinking a 2-compartment vertical shaft, present depth 200 feet, and is planning to sink to a depth of 500 feet, in the hopes of cutting the silver bearing ore zone. The shaft intersected No. 1 vein at a depth of 120 feet, and should cut No. 2 vein at a depth of 400 feet.

Mine equipment consists of 20-horsepower gas-engine hoist. Six men are employed.

FREMONT MINING DISTRICT.

This district is situated 20 miles southeast of Randsburg, in T. 31 and 32 S., R. 42 E., in a range of mountains which run in a north-westerly direction, of which Fremont Peak is 4600 feet above sea level and 1800 feet above the general level of the desert. A number of smaller hills are grouped south and southeast of Fremont Peak, and are included in the district.

In the southern end of the district, the Silver Dome Mine is located on a low range of hills, the highest peak having an elevation of 2831 feet. Fremont Peak and the surrounding low ranges of hills are of

igneous or volcanic origin. Granite underlies the entire district, and rhyolite-porphry lies upon and in contact with the granite. In the southern portion of the district where the Silver Dome Mine is situated, a belt of limestone occurs south of the granite area, and makes up the crest of the low range of hills.

Fremont Peak Mine is situated on the western slope of Fremont Peak, at an elevation of 3700 feet. Holdings consist of 12 claims, 240 acres, in T. 31 S., R. 41 E., 18 miles southeast of Randsburg. Owner, L. A. Mason, Oakland. Under option to *Monarch Mining Company*, Randsburg; John C. Kellar, president; A. B. Hall, manager.

A series of parallel quartz veins occur in the granite, and also on the contact of the granite and rhyolite-porphry dikes. The veins have a general east and west course, dip 70 degrees north, widths varying from 12 inches to 2 feet.

Development consists of an incline shaft 100 feet deep, with levels at 50 and 100 feet. On 50-foot level there is a drift west 125 feet, and 100 feet east. In the west drift on the 50-foot level, about 20 feet west of the shaft, the vein is cut by a north and south fault, dipping 60 degrees east. This fault cut off the ore shoot. A pay shoot has been developed 60 feet in length west of the fault. Its average width is 12 inches, and it is said to average from \$25 to \$50 per ton. One-quarter mile southeast of the shaft, at an elevation of 3800 feet, are two cross-cut tunnels about 50 feet apart; No. 1 Tunnel being 100 feet. No. 2 Tunnel is located 50 feet east of No. 1, is driven 60 feet south to No. 1 vein on a rhyolite dike, then drifted 100 feet east on the vein, and cross-cut 90 feet south to No. 2 vein. The veins occur on both walls of a rhyolite dike. They have a width of 6 to 8 inches, strike east and west, and dip 35 degrees north. Near the crest of the ridge, at an elevation of 4000 feet, a tunnel has been driven 200 feet east on a narrow vein of quartz 4 to 6 inches wide, which dips 35 degrees north.

Equipment: 10-horsepower gas-engine hoist, cars, blacksmith shop and dwellings. Twelve men are employed.

Silver Dome Mine comprises 10 claims along the lode veins, and 160 acres covering the limestone deposit, totaling 360 acres, located in Sec. 32, T. 12 N., R. 42 E., 20 miles southeast of Randsburg.

Owners, Silver Dome Mining Company, Phoenix, Arizona; Capt. A. Rolling, president; F. Knappin, secretary.

Country rock is granite and limestone. Four parallel veins occur in the granite. These veins occur along fault fissures in the granite, which strike east, and dip from 45 degrees to 65 degrees north. The vein filling is quartz, calcite and inclosed wall rock, mineralized with chalcopyrite, pyrite and bornite, with values in gold and silver. Widths vary from 4 to 8 feet.

Developments: A shaft has been sunk on one of these parallel veins on an incline of 45 degrees for 200 feet. Here the vein straightens to 85 degrees, and the shaft follows the vein on its dip for 103 feet. At a depth of 265 feet, a drift is driven on the vein 100 feet east and 50 feet west. The ore developed on this level is reported to carry from 3 to 12 per cent copper, \$7 to \$20 in gold, and 7 to 15 ozs. of silver.

A number of intrusive diabase dikes occur in the granite, and one of these dikes forms the footwall of the vein on the 265-foot level.

Mine equipment: 25-horsepower Western gas engine hoist, two 9" x 14" Chicago pneumatic compressors, a No. 5 Cameron pump, cars, trucks, blacksmith shop and dwellings.

A water supply is secured from springs and from the shaft.

Fifteen men are employed. Capt. A. Rolling, manager.

ORO GRANDE DISTRICT.

Ophir Mine, located six miles northeast of Oro Grande, has been taken over by the *Rentchler Mines Company* of Los Angeles; Harvey G. Wolf, president; C. A. De Coe, secretary.

The property consists of four claims, and is developed by three shafts from 185 to 300 feet in depth. The company is planning to install an electric-driven hoist, and to start development work on the property at an early date.

OIL FIELD DEVELOPMENT OPERATIONS.

By R. E. COLLOM, State Oil and Gas Supervisor.

Early in April of 1923, petroleum production in California had apparently reached the saturation point. The average daily production for the state had increased from 325,000 barrels daily in April, 1922, to 715,000 barrels daily in 1923. After reaching the 700,000 barrel mark at the beginning of April, 1923, the average daily production, up to the time of this report, June 15, 1923, remained close to 700,000 barrels per day.

This did not signify, however, that the peak of production had been reached. It simply meant that 700,000 barrels per day represented the maximum capacity of California's storage, transportation and marketing system, and therefore producers found it necessary to 'pinch in' flowing wells and otherwise curtail production.

Development operations at Huntington Beach, Long Beach and Santa Fe Springs oil fields being responsible for the overproduction of crude oil in the state, operators in those fields, working in cooperation with marketing companies, started in May, 1923, to restrict the normal flow of wells by 30 per cent in order to keep production down.

The logical means of curtailing production was to stop drilling. However, the complicated interests of lessors, royalty holders, drilling contractors and town-lot operators, seem to have made a concerted effort in this direction impossible. The next best step was to 'pinch in' production of wells already drilled even though drilling and the bringing in of new wells could not be stopped.

Four reductions in the value of the crude product within a year caused no appreciable check in drilling. Over 600 wells were drilling in the three fields on June 10, 1923. These were distributed as follows: Huntington Beach 154, Long Beach 275, and Santa Fe Springs 247. The movement to restrict the output of individual wells will further curtail the profits derivable from each producing unit. The oversupply is being more actively maintained by initial productions of wells just completed than the rapidly declining old wells. Initial production of 12 wells recently completed at Santa Fe Springs averaged 3950 barrels per well as compared with an average daily production of 1600 barrels per well for all producing wells in the field.

Initial productions for wells brought in at Santa Fe Springs during the week ending May 31, 1923, were as follows:

Initial Productions Santa Fe Springs Oil Field.

| Company | Well No. | Depth of completion, feet | Date of completion | Initial production in barrels per day |
|--------------------------------|-----------------------|---------------------------|--------------------|---------------------------------------|
| George F. Getty..... | "Parcell" 8 | 4700 | May 30 | 6700 |
| Wilshire Oil Co..... | "Surbeck" 1 | 4666 | May 24 | 2250 |
| White Star Oil Syn..... | 3 | 4679 | May 25 | 3000 |
| Petroleum Midway Co., Ltd..... | "Patterson" 4 | 4908 | May 28 | 2000 |
| Standard Oil Company..... | "So. Whittier Com." 9 | 4765 | May 29 | 500 |

At Santa Fe Springs oil field 112 wells were producing 235,755 barrels daily on May 24, 1923, prior to the general move to 'pinch in' production. On May 31, 1923, after the 30 per cent curtailment of

production was put into effect, and after the five new wells listed above had come in, the average daily production was 232,158 barrels, an actual net curtailment of 3597 barrels, or 1.6 per cent.

It should be borne in mind—in this town-lot development—that an appreciable amount of drilling has been financed by people not experienced in the oil industry. They have invested in things hoped for rather than seen. Probably such drilling will continue regardless of the profit that can be realized from the product. It is estimated that \$58,000,000 has been expended in drilling alone since these fields started. The three fields have produced approximately 107,130,000 barrels from January 1, 1921, to June 1, 1923.

At the beginning of 1921 there were 43 producers of petroleum in Los Angeles and Orange counties. In January, 1923, the number of producers had increased to 175.

There has been no material change in the number of marketing concerns. Five of the large marketing companies of California are confronted with the huge task of taking care of a major portion of the production, providing transportation, storage and refining facilities, for a greater additional quantity of crude oil than these same companies handled throughout the entire plant of the industry at the beginning of 1921.

As of June 1, 1923, the following is the status of operations of the three southern fields which dominate the oil situation in California:

| Field | Wells drilling | Wells idle | Wells producing | Average daily production, barrels | Average daily production per well, barrels | Drilling below 4000 feet |
|------------------------|-------------------|---------------|--------------------|--|--|--------------------------------|
| Long Beach | 275 | 64 | 181 | 192,693 | 1,062 | ----- |
| Huntington Beach | 154 | 131 | 168 | 110,914 | 656 | ----- |
| Santa Fe Springs | 247 | 26 | 112 | 232,158 | 2,070 | 133 |
| Total | 676 | 221 | 461 | 535,765 | 792.5 | 133 |

From March 10, 1923, to and including April 7, 1923, the following new wells were reported as ready to drill:

| Company | Sec. | Twp. | Range | Well No. | Field |

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau, as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff and others are published in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

CLAY DEPOSITS OF THE ALBERHILL COAL AND CLAY COMPANY.

By JAS. H. HILL.¹

Location.

The clay deposits of the Alberhill Coal and Clay Company, comprising some two thousand acres of land, are situated at the town of Alberhill, in Riverside County, California, approximately seventy-five miles southeast of Los Angeles. Reference to the accompanying map, Plate 1, will indicate the region directly served by them, and their central location with respect to the many important towns and cities of this district.

The great economic importance of these deposits may be considered to be due to three main factors:

- (1) The excellent quality, wide variety, and enormous quantities of the clays available.

- (2) The extensive commercial development of the deposits over many years, resulting in cheapness of mining and large-scale production.

- (3) The fortunate central location in a densely populated and rapidly growing section.

The portion of southern California served from these deposits has for several years shown an almost unprecedented growth in wealth, population, and commercial development, with a resulting demand for clay products of all kinds far in excess of the ability of local manufacturers to supply. Clay working plants have continually increased their capacities, and many new ones have sprung up in response to the insatiable demand for building materials and pottery wares of all sorts, so that the Los Angeles district is now one of the great clay-working centers of the United States. A great preponderance of the raw material for these plants has been supplied by the Alberhill deposits, owing to their natural advantages in quality of clays and cheap quantity production.

¹President, Alberhill Coal and Clay Company.

Plate 1. Location of the Alberhill Coal and Clay Company's Deposits at Alberhill, California.

The occurrence of the Alberhill clays is uniquely favorable, since the deposits comprise an entire small mountain or detached foothill some five miles in circumference, rising abruptly from the floor of the Temescal Valley. The tracks of the Atchison, Topeka, and Santa Fe Railway skirt the base of this hill, closely adjacent to the clay pits themselves, so that the clay may proceed by gravity haulage direct to loading trestles over the rails. Further advantage of the elevation of the clays above the rails has been taken in the mining processes, as will be noted later, with the result that large tonnages are handled at a minimum cost.

General Geology.

"The valley in which these extensive deposits lie was in Tertiary times an arm of the sea opening northward into the valley of western San Bernardino County and extending southerly to Temecula. Its width is from one to two miles, but its depth is unknown, as at the old terra cotta works near Alberhill a drill hole was sunk over 600 feet without reaching the bottom of the basin."¹

At the Alberhill pits, the clays present a wide diversity of color, character, and degree of consolidation. An extraordinary variety is found, including silicious fire clays, ball clays, plastic white- and buff-burning clays, highly aluminous and very refractory clays, numerous red-burning clays, and an extensive bed of material from which a china clay is obtained by washing. A bed of lignite coal ranging from two to eleven feet in thickness occurs conformably with the clay strata, and adjacent to this the best fire clays are found. The strata are regular

¹'Clay Industry in California,' Preliminary Report No. 7, January, 1920, California State Mining Bureau.

Photo No. 1. Southwest wall of the Main Pit of the Alberhill Coal and Clay Company. The heavy stratum of clay directly behind the bunker is Main Tunnel Fire Clay. In the background, Plant No. 4 of the Los Angeles PRESSED Brick Company, which draws clay direct from the Alberhill pits.

and persistent, and dip to the southwest with an average value of 10 degrees, with local variations due to an undulatory or wavy folding.

Minor local disturbances appear to have prevailed at intervals during deposition of these clays, and coarse sandy beds are interspersed with fine-grained plastic clays. In these sandy beds, the coarse silica sand is often intermixed in a sporadic and irregular fashion with the accompanying clay substance. Mottled clays apparently due to simultaneous deposition of different kinds of sediments derived from separate sources are also found. The beds in general seem to indicate that long quiescent periods during which fine grained clays were laid down were preceded and followed by stormy periods when frequent freshets or strong tidal currents brought in coarse silica sand and granitic debris from surrounding highlands. The top soils of the region consist of debris of disintegrated granite, and vary from a few inches to many feet in thickness.

Photo No. 2. Looking into the Main Pit of the Alberhill Coal and Clay Company from the West Pit. The pit walls here shown range up to sixty feet or more in height, all clay.

Extent and Commercial Development.

Owing to the masking of the surface by the layer of disintegrated granitic material, the total extent of the Alberhill deposit has not yet been fully determined. However, a large number of bore holes have been put down on widely separated portions of the property, and in every case clays of good quality were found to the full extent of the hole in depth. From this and other evidence, it seems quite probable that the entire mass of the small mountain, above the valley floor and for an unknown depth below, is clay. A few isolated occurrences of shale have been noted. Exploration to date has been sufficient to indicate beyond doubt that the quantity of readily available clay is so vast as to be inexhaustible for all practical purposes, and this fact, in combination with the good quality of the clays, makes the deposit one of great commercial importance. The hill comprising the deposit is about two and one-quarter miles long and one mile in width, with an average

elevation of 1680 feet. The main line tracks of the railway skirting the hill are at an elevation of about 1277 feet, so that the enormous tonnages awaiting development by simple gravity processes are evident. The present pits are all somewhat above the level of the railroad tracks.

Up to the year 1895 the Alberhill Coal and Clay Company operated the property principally as a coal mine, extracting and marketing the lignite coal previously mentioned as occurring with the clays. From that year onward, however, the sales of clay rapidly increased, and very soon completely overshadowed the coal in importance. At the present time the coal is mined only for local and special uses, but there is a large tonnage available and merely awaiting modern practice in the way of distillation or use as powdered fuel.

A small trainload of clay leaves the Alberhill pits each working day for distribution to the southern California clay-working plants, and the production for the year 1922 reached a total of approximately 2500 car-

Photo No. 3. Notch connecting Main and West Pits, Alberhill Coal and Clay Company. Plant No. 4 of the Los Angeles Pressed Brick Company in the background.

loads. The clays enter into the manufacture of a great diversity of products, ranging from china to coarse wares such as sewer pipe and hollow tile. The production of high grade face brick made from these clays reaches very large proportions, and these may be seen in numerous buildings throughout the towns of southern California, and to some extent in neighboring states. Fire brick and refractories to the number of several millions annually are made from the fire clays supplied by the company. It is probable that these two lines account for the greater part of the total tonnage produced. A large modern plant which draws its clays direct from the Alberhill pits is operated at Alberhill by the Los Angeles Pressed Brick Company, and it seems probable that the commercial advantages of a location directly at the source of raw material will result in bringing additional plants in future. At present most of the plants to which clay is supplied are located in the Los Angeles industrial districts.

Among manufactured products for which Alberhill clays have been extensively used in recent years may be mentioned the following:

| | |
|-------------------------------|--------------------|
| Fire brick | Flue lining |
| Special refractories | Yellow bowls |
| Electric furnace refractories | Floor tile |
| Face brick | Faience tile |
| Pressed brick | Art tile |
| Enameled brick | Hollow tile |
| Architectural terra cotta | Roofing tile |
| Garden terra cotta | Sewer pipe |
| Art pottery | Stoneware |
| Chinaware | Chemical stoneware |
| Electrical conduit | Saggers |
| Drain tile | |

Photo No. 4. Stripping operations at the junction of the Main and West Pits, Alberhill Coal and Clay Company.

The Alberhill deposit, by reason of its operation over many years and the large production now attained, has undergone an extensive commercial development. Several pits are actively worked, of which the Main Pit and the West Pit are the most important. These pits have furnished thousands of carloads of clay, and are now very large excavations, though merely insignificant nicks in one flank of the hill when compared with its total bulk. Several tunnels have been driven into the deposit, the "West Tunnel" having a length of over 1000 feet in its main extent, with many side branches and feeders leading off at intervals. This tunnel is of large bore, heavily timbered, and electric lighted and equipped with mine tracks throughout for transfer of two-ton cars. No surface waters are permitted to enter, so that the tunnel remains dry and workable the year round. For general production purposes a complete equipment of tracks, mine cars, gasoline locomotives, trucks, wagons, mining machinery and tools, blacksmith shop, machine shop, bunk houses, workmen's and foremen's cottages, board-

Photo No. 5. Making up the daily clay train at Alberhill, from the Clay Mines of the Alberhill Coal and Clay Company.

ing house, water supply plant, and general store is maintained by the company. Extensive plans for the future of the town of Alberhill are under way, looking toward its development into a model industrial community. Trees are being planted, and the townsite graded and leveled by filling hollows and ravines with the stripping produced in the mining operations, preparatory to the laying out of a carefully landscaped industrial town by architects competent to make the best of its natural features, both for beauty and utility. The general plan of the company is that the community shall not be permitted to develop in a haphazard and unsightly way, and that it shall ultimately constitute an industrial town pleasant both to live in and to work in. Large

Photo No. 7. Looking into the Main Pit of the Alberhill Coal and Clay Company. Upper West Pit workings visible at extreme upper left.

Photo No. 8. Upper West Pit workings of the Alberhill Coal and Clay Company. This entire region is honey-combed with glory holes extending down to the West Tunnel and its off-shoots, 30 to 60 feet below.

parcels of favorably located land have been set aside as plant sites for future clay industries, and a nine-hole golf course has been completed and is maintained for the use of employees and the public generally.

Methods of Mining.

The general method of mining the Alberhill clays is by the usual open-pit workings. The clays are, for the most part, rather densely compacted and stand well in vertical banks. The faces of these banks are blasted down and the clay loaded into two-ton steel mine cars or trucks, to proceed directly to adjacent loading trestles over the switch lines entering the pits from the main tracks. Clays from the higher levels are shot down chutes into elevated bunkers, where convenient or desirable, under which trucks or mine cars may be run, and loaded by opening a discharge gate.

Plate 2. Handling and storage of clay by "glory hole" method.

Plate 3. Stripping by glory hole and tunnel method.

Photo No. 9. Lower portion of the West Pit of the Alberhill Coal and Clay Company. Near the bunker is seen the mouth of the West Tunnel, which extends back under the upper workings to the West Pit for over 1000 feet, connecting to the surface by numerous glory holes for storing and handling the clay.

Photo No. 10. Upper West Pit of the Alberhill Coal and Clay Company. One of the glory holes connecting with the West Tunnel, 50 feet below the surface.

In the 'West Pit' region a variation of the ordinary methods is extensively employed, as indicated by the accompanying diagram. The entire upper portion of the 'West Pit' region is underlain by the 'West Tunnel' and its offshoots, the tunnel roughly paralleling the longitudinal extent of the surface workings, and being from 30 to 60 feet below them. Large 'glory holes' extend from the surface workings down to the tunnel at frequent intervals, their lower ends closed by gates or valves for controlling discharge of the clay. The clays are mined in the usual way in the open workings above, and dumped into adjacent glory holes from which they are drawn off into cars on the tunnel tracks below as needed, to proceed thence to the loading trestles in the usual way. This system has been found economical and convenient, especially so as each glory hole constitutes a storage bin for two earloads (100 tons) of clay or more. A similar system is sometimes employed for stripping the clay strata of top soils and granitic debris, where tunnels have been driven beneath the area to be developed. (See accompanying diagram, Plate 3.) By this method a great funnel of the loosely compacted stripping can be very quickly cascaded down the glory hole, to be carried away to dumps by the mine cars which receive it on the tunnel tracks below.

In addition to the above processes, a considerable amount of underground work is always proceeding in conjunction with further development and extension of the tunnels themselves.

Geological Section of the Alberhill Deposit.

For convenience in discussing the different varieties of clays marketed, and as a means of indicating their geological horizon and method of occurrence, the accompanying geological section of the Alberhill deposit is given. This section is, of course, merely diagrammatic, and somewhat simplified to represent *average* or general conditions, since each locality shows small variations and departures from what may

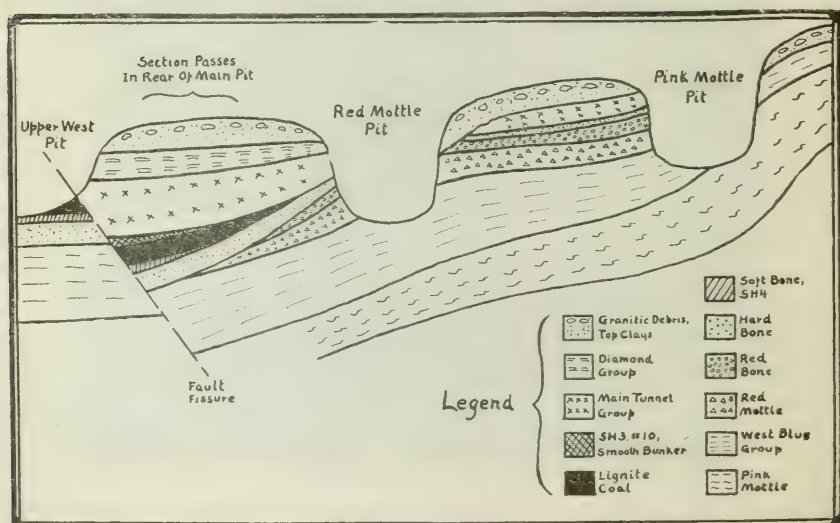

Plate 4. Diagrammatic section of strata at Alberhill, in a general west-east line.

be considered the normal. Certain clays may be much thicker bedded in one region than in another, and some grades of clay which constitute a characteristic variation of their stratum may be developed only in particular areas. The attempt has been, therefore, to present a diagrammatic representation of the complete sequence of beds, so that their relation may be grasped at a glance.

Photo No. 11. Stripping operations of the Alberhill Coal and Clay Company. Rear wall of Main Pit visible in background.

Each stratum or 'group' here shown represents as nearly as possible, a geological period during which the conditions of deposition were essentially uniform. The clays mined from any given stratum show a noticeable similarity in character and a relationship to each other, though they may be commercially graded into two or three varieties. On passing to another stratum or group, a pronounced change in the general character of the clay is noted. The fault, or slip, noted as

occurring near the east side of the 'West Pit' is not of great consequence, being only two or three hundred yards long and with a maximum down-throw of thirty feet or so. The continuation of any bed is readily picked up on crossing it.

Individual Clays.

More than thirty varieties and grades of clay are mined and marketed by the Alberhill Coal and Clay Company, among which those suited to almost any branch of the clay-working industry may be selected. There are, however, a number of these clays which, by reason of their wide usefulness and extensive commercial employment, are specially important. Brief notations regarding the character and uses of these clays follow. The clays are designated by the name under which marketed.

SH4 BALL CLAY.

This is a clean clay of very high plasticity, possessing great bonding or 'carrying' power in the plastic state. It has proven very useful in a great variety of mixes with less plastic grades, in the way of imparting improved color and working quality to the mix. SH4 clay is considerably more refractory than English ball clays, and burns to a much whiter color, approaching washed English China clay in this regard. It is not safe burning alone, but works excellently in proper combination with other clays, and has many valuable qualities. The accompanying analysis indicates its average composition:

| <i>*Analysis of SH4 Ball Clay.</i> | | Per cent |
|------------------------------------|-------|----------|
| Silica | ----- | 47.08 |
| Alumina | ----- | 33.36 |
| Iron oxide | ----- | .96 |
| Lime | ----- | .66 |
| Magnesia | ----- | Trace |
| Sodium and potassium oxides | ----- | .13 |
| Moisture, 105 degrees C. | ----- | 3.98 |
| Combined water and volatiles | ----- | 12.88 |
| Titanium oxide | ----- | 1.38 |
| Manganese oxide | ----- | Trace |
| Chlorine | ----- | None |
| Sulphuric anhydride | ----- | None |
| Nitric anhydride | ----- | None |
| Phosphoric anhydride | ----- | None |
| | | 100.43 |

*Analysis by Smith Emery Company, Los Angeles, Cal. Some of the samples of this clay analyzed have shown a content of iron oxide up to 1.9 per cent, but in such cases the titanium seems always to run low, so that the total percentage of coloring matter remains approximately constant.

As mined, SH4 is dark gray in color, and a dry lump placed in water will flake down and disintegrate within less than one minute. The resulting flaky material, when worked and kneaded, becomes exceedingly plastic. This clay has been used in the manufacture of china, porcelain, refractories, pottery, and many other wares where a very plastic clay is needed to carry less plastic materials, and a good white color is particularly desired.

SH3 CLAY.

This is a white-burning clay locally developed directly over the lignite coal bed. It is light gray in color, breaks down readily in water, and works up to a condition of good plasticity, though it has not as great bonding power as SH4. In burned color it is not quite so white as SH4, but it is much safer in drying and burning, and has considerably less shrinkage. It is fairly refractory in character, but burns to a strong body at very moderate heats. It might be mentioned here that all the Alberhill clays, even the red-burning varieties, possess an unusually long heat range; and are safe from over or under burning.

SH3 in proper combinations has proved excellent for the manufacture of faience tile, garden terra cotta, face brick, enameled brick, building terra cotta, saggars, and similar products. Recent experiments in washing the clay seem to indicate that its color may be sufficiently improved by this process to allow of its use in china and porcelain bodies in larger quantity than has heretofore been considered permissible. The following analysis indicates the general character of the clay as mined:

| <i>*Analysis of SH3 Clay.</i> | | Per cent |
|------------------------------------|--|--------------|
| Silica ----- | | 63.00 |
| Alumina ----- | | 23.83 |
| Iron oxide ----- | | 1.28 |

| | | <hr/> 100.18 |

*Analysis by Smith Emery Company, Los Angeles, Cal.

No. 10 CLAY.

This clay somewhat resembles SH3 in general performance, and is suited for similar purposes. It carries a little more silica sand than SH3, and is also more carbonaceous, and generally not so densely compacted. The color of the raw clay is generally dark gray, due to carbonaceous matter. No. 10 clay has good plasticity, burns white or grayish white, is fairly refractory, and produces a strong body at moderate heats. It is a much safer clay than SH4, and has less shrinkage, but is not quite so white-burning.

No. 10 clay has been very extensively used in the manufacture of face brick, faience tile, terra cotta, and similar products. In composition it does not differ greatly from SH3, but generally shows a slightly higher proportion of silica as compared with alumina, and a higher percentage of volatiles due to the carbonaceous matter.

MAIN TUNNEL FIRE CLAY.

This clay is commercially one of the most important produced at Alberhill, in view of its very extensive use in the manufacture of fire brick and refractories generally. It occurs in enormous quantities, the bed being often twenty feet or more in thickness. In character it is a

Photo No. 12. Clay mines of the Alberhill Coal and Clay Company. An exposure of the lignite coal. The clay stratum directly below the coal is SH4; that directly above is SH3 Clay.

siliceous fire clay and it is customarily graded into three varieties for marketing—'Main Tunnel,' 'Select Main Tunnel,' and 'Extra-Select Main Tunnel.' These varieties do not differ greatly in refractory quality, the grading being on the basis of the amount of coarse silica sand of which the 'Main Tunnel' carries a large amount, the 'Extra-Select' practically none. Analyses of the 'Main Tunnel' and 'Select Main Tunnel' grades are given below. The alumina-silica variation is due to the lesser proportion of coarse silica sand in the 'Select' grade, and a similar though much less marked difference exists between the 'Select' and 'Extra-Select.'

| | 'Main Tunnel' Clay Per cent | '*Select Main Tunnel' Clay Per cent |
|---------------------|--------------------------------|--|
| Silica ----- | 75.46 | 59.44 |
| Alumina ----- | 16.22 | 26.28 |
| Iron oxide ----- | 2.24 | 2.24 |
| Lime ----- | .03 | .26 |
| Magnesia ----- | Trace | .20 |
| Alkalies ----- | .20 | .15 |
| Ignition loss ----- | 6.24 | 11.64 |
| | <hr/> 100.39 | <hr/> 100.21 |

*Analysis by Smith Emery Company, Los Angeles, Cal.

The 'Main Tunnel' Fire Clays are gray in color, and quite dense and hard as mined, but break down readily in water and work up to a condition of good plasticity. They will carry a considerable proportion of grog where this is desirable, and possess a self-lubricating property that makes them work well from a die. In refractory qualities they have proved excellent, and several million fire brick and special refractories of one sort or another are made from them yearly in the Los Angeles district. These clays are all very safe in drying and burning, and find also a considerable field outside the line of refractories. The 'Select' grade is extensively used as a sagger clay, in combination with one or another of the red-burning clays mined at Alberhill, and such saggars are reported by a prominent eastern manufacturer to show about five times the life of his eastern saggars, under similar conditions.

SMOOTH BUNKER CLAY.

This is a white-burning clay carrying a considerable proportion of coarse silica sand. Owing to its low shrinkage and exceptionally safe drying and burning qualities, it has been rather extensively used for a wide variety of products, notably face brick and refractories, flue linings, and hollow tile mixes. Smooth Bunker has very fair plasticity, especially considering the amount of natural grog carried by it in the form of coarse silica sand, and it is readily workable. It breaks down in water without difficulty, and works up plastic at once.

'BONE CLAY.'

This clay shows an alumina content ranging up as high as 48 per cent in certain varieties, and is one of the most peculiar and unusual clays mined at Alberhill. It is being used at present for special purposes where its peculiar composition makes it of value, notably for the production of electrically fused refractories of the highest grade, and for high-alumina fire brick. It will probably be in much more general demand later, as its valuable qualities become better understood.

Photo No. 13. Rear wall of the Main Pit of the A'berhill Coal and Clay Company. Main Tunnel Fire Clay is being mined.

The 'Bone' clays occur in two varieties, 'Hard Bone' and 'Soft Bone.' The 'Soft Bone' occurs directly under the lignite coal in certain localities, and is a loosely compacted clay having an ashy appearance. It breaks down slowly in water, and has only a low degree of plasticity unless finely ground by some mechanical process, when a considerably increased plasticity is developed. The Soft Bone appears to run somewhat higher than the Hard Bone in alumina, usually, and is highly refractory in character.

The 'Hard Bone' occurs directly under the Soft Bone, the two often merging imperceptibly. This variety is dense and hard, and shows small spherules or 'eyes' of dark colored material scattered throughout the ground mass of the clay. It was at first supposed that these consisted of highly aluminous material in the nature of gibbsite or diaspore, but later investigation seems to indicate that the alumina is carried by the ground-mass of the clay substance, and that the dark spots are merely in the nature of segregations of ferruginous matter.

A dry lump of Hard Bone, when placed in water, will rapidly crack down into a loose mass of small, sharp-edged fragments, which show no further softening even on prolonged soaking. The resulting mass of fragments is sandy and noncoherent, with no appreciable plasticity. If, however, the grains are strongly worked, or crushed to fine mesh, a surprising degree of plasticity is developed, and particularly an extremely 'sticky' quality, the clay adhering so strongly to a knife blade or mortar pestle that it is washed or scraped off with difficulty.

The Bone clays, as mined, burn to a grayish-white-body, considerably check-cracked, and having a dull ring. They are exceptionally well suited for the manufacture of high-alumina refractories, and are already extensively used for such purposes, and for the special electrically fused refractories previously mentioned. Experimentation along the line of refining these clays by washing, etc., has shown that a fine plastic white-burning material can be obtained, and it is probable that this will ultimately be produced for use in porcelains and china. The accompanying analysis indicates the general composition of the Bone clays. The alumina content varies somewhat according to the locality in which the clay is developed.

Photo No. 14. A portion of the Hill Blue Pit of the Alberhill Coal and Clay Company. In addition to Hill Blue Clay, another variety, known as Hill Blue-Green, is mined in this pit from the stratum overlying the Hill Blue.

HILL BLUE CLAY.

This clay is one of the most widely used clays mined at Alberhill, by reason of its clean character, high plasticity, and safe drying and burning character. It has many of the qualities of a good ball clay, with much safer burning and drying qualities than usual in a clay of such high plasticity, and less shrinkage. It is extensively employed as a bond clay, and for helping the plastic working qualities of mixes in a wide variety of products.

Hill Blue is an excellent sagger clay, and will carry with ease 50 per cent of grog, or large proportions of less plastic clays. Among the important uses for which it is suited, in correct combination with other Alberhill clays, are faience tile bodies, terra cotta, face brick, enameled brick, yellow bowls, garden terra cotta, pottery, stone ware, and similar products. In fact, Hill Blue is a useful clay in almost any mix where extreme whiteness is not a requisite. Very large single pieces of garden terra cotta, such as vases up to seven feet in height and of large diameter, are made from mixes of Alberhill clays in which Hill Blue is a main constituent, and these habitually come from the kilns without a single crack or check.

Hill Blue burns to a creamy color, the color darkening somewhat at high temperatures. It breaks down without difficulty, though a little more slowly, in water, than the majority of the Alberhill clays, owing to its very plastic character. Like the other Alberhill clays, it has a long heat range, and produces very strong bodies from Cone 1 or less to well above Cone 10. At Cone 9 the body is very hard and dense, but not quite vitreous, and the shrinkage only one in nine or one in ten. The accompanying analyses indicate its general composition.

WEST BLUE CLAY.

SELECT WEST BLUE CLAY.

These two clays are commercial varieties derived from the same bed, the 'Select' grade being a somewhat cleaner variety. Both are somewhat less plastic and carry more sandy matter than Hill Blue, but this does not seem to interfere with their usefulness to any appreciable degree, and these clays rival Hill Blue in their extensive application and general usefulness. The stratum in which they occur is one of the thickest and most massive found at Alberhill.

Either of these clays, when slipped, screened, and treated with electrolyte in the usual way, makes a perfect natural casting mix without addition of any other constituent. Pottery made in this way burns to

Photo No. 15. Mining Select West Blue Clay, Lower West Pit of the Alberhill Coal and Clay Company. The massive character of the bed is evident. Everything shown here is marketable clay. Hard Bone Clay overlies the Select West Blue at this point.

a strong porous body at ordinary heats, the color being creamy or buff depending on the character of the fire, degree of heat, etc. The great field for the use of these clays, however, at present lies in such products as face brick, terra cotta, electrical conduit, ladle brick, roof tile, hollow tile, etc. The raw clays, up to Cone 9 or beyond, burn to a tight body of creamy color, with appearance of a black speckle at the higher temperatures.

D.C. CLAY.

This material is that previously mentioned as yielding a china clay on washing in the usual way. The crude clay consists of a fairly plastic clay substance carrying a large proportion of sandy and shaly detritus. In washing, a separation of about 50 per cent of fine smooth clay substance is obtained, depending somewhat on the extent to which the refining process is carried. The crude D.C. Clay, burned at Cone 9 or above, produces a white body with an intense black speckle, closely resembling the manganese speckle gray brick so widely marketed. These black specks are due to the shaly or granitic material of the crude clay, and it seems probable that the residue obtained from washing will make an excellent substitute for the manganese commonly employed to produce the black speckle in gray brick.

Following the usual washing process and separation of this sandy material, a china clay equal in plasticity to most grades of English china clay is obtained. The burned color at Cone 9 or above is not so good as that of the English clays, but further experimentation in refining seems to indicate that the burned color may be considerably improved by better methods of washing, and it is believed that a china clay applicable to the customary uses of the English clays will be obtained eventually. The washed D.C. Clay so far produced shows much promise, as it has valuable qualities in the way of promoting quick draining, safety, and readiness in freeing from the mold to casting slips, and its plasticity allows of easy jiggering and general working in the plastic state. It is a very safe material, and its shrinkage is less than that of the usual English china clay. The following analysis indicates the composition of the washed material.

RED-BURNING CLAYS.

A number of red-burning clays of good quality are produced at Alberhill, among which only the more important will be mentioned here. The Alberhill red clays, as a class, are unusually refractory, many of them enduring Cone 9 without destructive over-burning. They have in consequence a long heat range conducive to safety in the kiln.

RED MOTTLE CLAY.

This is a plastic clay of blood-red color or salmon-red color in the raw state, more or less mottled with white. It burns to a fine red color, and is suited for quarry tile, roof tile, red and flashed brick, sewer pipe, and red wares generally. Red Mottle clay breaks down at once in water, and works medium plastic. In quality it is fine-grained, clean, and smooth. At Cone 3 the body is dense and hard, with practically no adherence to the tongue, shrinkage plastic to Cone 3, 1 in $6\frac{1}{2}$, color a fine red.

PINK MOTTLE CLAY.

This clay is uniquely beautiful in its natural state, as it consists of a fine wavy mottling of red, blue, white, lavender, and purple sediments, resembling a fine variegated marble. It breaks down at once in water, and works up to a state of medium plasticity, but its burned color is not so good as that of the Red Mottle. Pink Mottle, unlike most of the Alberhill red clays, is overburned to a destructive degree at Cone 9. At Cone 3 the body is dense and hard, with little adherence to the tongue, shrinkage plastic to Cone 3, 1 in 10, color a fair red, but would be improved by addition of barium carbonate in the usual way. Owing to its low shrinkage, Pink Mottle is a useful clay in combination with red-burning clays of high shrinkage but otherwise desirable quality. It is a very useful clay for such products as sewer pipe, hollow tile, paving brick, and red wares generally, where the finest color is not required, and may be added in considerable quantity to mixes for fine red wares also, where a clay-like red mottle is used to give the desired color to the product. The following analysis indicates the general composition of Pink Mottle.

| <i>*Analysis of Pink Mottle Clay.</i> | | Per cent |

RED BONE CLAY.

As the name indicates, this clay is a reddish variety of the bone clays previously mentioned, and it exhibits many of their peculiarities, particularly in its behavior when wetted. It breaks down, like the white bone, into an aggregation of angular fragments which do not soften appreciably unless strongly worked or crushed. Red Bone is a refractory clay, enduring Cone 9 without difficulty, and has proved a useful 'back-bone' clay in sewer-pipe mixes. It can be used to advantage in mixes for the production of fine red and flashed brick and gun-metal

brick, but its most important use so far has been for sagger's. Combined with certain other Alberhill clays, it gives an exceptionally durable sagger, and it is utilized for that purpose to an extensive degree.

WEST YELLOW CLAY.

This clay is of a rather low-heat character, compared with most of the Alberhill red clays, being nearly vitreous at Cone 3. The burned color is a bright red, not quite so good as that of Red Mottle. At Cone 9 the body shows attractive flashings of purple and gun-metal shades. While West Yellow has only moderate plasticity, it acts like a ball clay in drying, being slow to dry and tending to warp. It is unsafe in burning, and requires to be mixed with other safe clays, but it is a useful clay in a variety of products, especially fine red and flashed brick, quarry tile, sewer pipe, roof tile, and sagger mixes where it is desired to tighten the burned sagger somewhat. This clay breaks down somewhat slowly in water.

HILL BLUE GREEN.

Hill Blue Green is chiefly valuable for its plasticity, vitrifying qualities, and attractive flashed color at higher temperatures. It is very unsafe alone and must be used sparingly with safer clays. It is adaptable to mixes for the production of roof tile, sewer pipe, quarry tile, red and flashed brick, and paving or sewer brick. It breaks down somewhat slowly, but without difficulty, in water.

WEST TUNNEL BLUE.

This clay is not so attractive as Red Mottle or West Yellow in burned color, but possesses a valuable quality in that it dries to an exceptionally strong body in the 'green' state. It is therefore a useful clay in sagger mixtures where it is desired to add to the strength of the dry sagger before burning, so that it may be handled safely, and also to tighten the burned body somewhat. It is a clay of only moderate plasticity, and carries a considerable amount of shaly and sandy material. The shrinkage is low—1 in 10, plastic to Cone 3—and it is a safe clay advantageous to mix with the fatter clays. West Tunnel Blue is useful in sewer pipe, red and flashed brick, roof tile, and hollow tile mixes. The following analysis indicates its general composition.

RED SHALE.

A large bed of this material is available at Alberhill, but has so far undergone no commercial development. It does not break down in water, and requires to be ground previous to use. Bricks made of this ground shale show a very fine red color, superior even to that of the Red Mottle Clay.

LIGNITE COAL.

A large tonnage of this material occurs at Alberhill in a bed ranging from 2 to 11 feet in thickness. The degree of consolidation varies considerably, some of the material approximating coal in character, while in other localities soft and loosely compacted varieties occur. At present the coal is not marketed in any considerable quantity, but it is probable that it will be a factor of importance in the future of Alberhill, since it comprises a large supply of cheap fuel exactly on the spot where fuel is necessary. Investigations into the possibility of distilling or bricketting this coal are now in progress, and its use as a powdered fuel does not appear to offer any great difficulties. A trial made along these lines showed that high temperatures were readily obtainable with the Alberhill coal as fuel. The accompanying analyses indicate the average values:

[NOTE.—A comprehensive exhibit of the principal varieties of the above-described clays is on display in the Mineral Museum of the State Mining Bureau, San Francisco.—EDITOR.]

OIL SHALE IN SANTA BARBARA COUNTY, CALIFORNIA.

By F. D. GORE.^a

Introduction.

California produces oil at the present time from natural resources in three different ways, namely:

1. Drilling and tapping underground reservoirs from which oil flows or is pumped.
2. Extraction, by means of solvents from bituminous rock.
3. Destructive distillation of oil shale.

The first method is, of course, the most important and California production of oil today equals about one-third that of the United States.

The second method is practically of no interest at the present time. While there are numerous deposits of bituminous rock easily accessible in California, the future of the industry depends entirely upon the market price of oil, as this process of extraction is comparatively costly.

The largest deposit of bituminous rock in the coast region of California is located about five miles south of San Luis Obispo. Wells in the Arroyo Grande Oil Field are producing a low gravity oil from this sandstone, commonly known as Pismo Formation.

There are other deposits of less importance distributed over a large area in Santa Barbara County, the locations of which are shown on Plate No. 1.^b Some of these deposits have been mined years ago for the high grade of asphalt obtained.

There are at the present time two plants under construction for the recovery of oil from bituminous rock in San Luis Obispo County. A description of one of these plants is given in the California State Mining Bureau publication 'Mining in California' under date of June, 1922. The process is briefly as follows: The oil saturated sandstone is conveyed from the mine to the plant by a ground sluice which empties into a double screw log washer. From the log washer it passes through a Cottrell vibrating screen, which removes the gravel. From the vibrating screen the sand passes through three K and K mixers in parallel and from here the material flows to eight K and K flotation machines used as roughers. From the roughers the flotation oil concentrate is sent to four K and K flotation cleaning machines. From the cleaners the oil concentrate goes to two additional K and K cleaners and then to a Dorr thickener. From the thickener the concentrate is sent to a storage and settling tank. It is then ready to be refined.

There has not been sufficient progress made on the other plant to warrant a report at this time.

The third process is becoming more important as the oil obtained from the bituminous shale is peculiarly adapted to use as flotation oil, an oil used in the recovery of sulphide minerals in ores.

This paper deals primarily with the oil shale industry of Santa Barbara County, California, and sets forth the location of the deposits, geological conditions governing the occurrence of same and the description of the different processes now in operation.

^aF. D. Gore, Deputy Supervisor, District No. 3, Santa Maria, California.

^bPlate No. 1—Areal map of oil shale deposits in Santa Barbara County.

To Dr. David T. Day, the writer is indebted for information concerning the Day Process of oil extraction.

A COMPARISON OF CALIFORNIA OIL SHALE TO OTHER SHALES.

The principal deposits of oil shale occur in Santa Barbara and Ventura counties, in and near the present producing oil fields. The production of oil in the Santa Maria, Casmalia and Lompoc oil fields is obtained from this oil shale, commonly termed 'brown shale.'

The oil shale of California should not be confused with the shales of other parts of the United States and foreign countries, as it is different both physically and chemically. It is in a truer sense an oil-saturated diatomaceous shale from which oil may be extracted by the use of any of the well known solvents, such as benzol, chloroform, pyridine, et cetera.

Utah and Colorado shales are similar to the Scotch shales in the character of their Kerogen Content. New Brunswick shale, on the other hand, differs slightly in that it resembles a Torbanite. The shales of Indiana, Illinois and Kentucky vary considerably, some of the deposits resembling the Utah and Colorado deposit, with this exception: The oils produced as a result of destructive distillation contain a higher percentage of so-called tar acids (phenols and creosotes); in fact, shales are known in Illinois which yield oil similar in every respect to the low temperature distillation products from coal, containing, in some instances, as high as 30% tar acids. This indicates that some of these so-called shales are in reality a low grade Cannel coal.

The shales of Utah, Colorado and New Brunswick contain a solid bitumin which, when destructively distilled, yield an oil. This bituminous matter is insoluble in any of the well known solvents, and the oil is only obtained as a result of destructive distillation reactions.

The spent shale or residue from both the Colorado and Utah shales are largely silicates of one form or another, having a high aluminum content, whereas the California shale residue is high in silica.

| Initial boiling point..... | 212° F. |
| Water..... | 0.5% |
| Oil distilled at 423° F. 0.8%—Spec. gr..... | .8396—36.7° Baume |

Distillation continued with steam, collecting the distillate in 10% fractions as follows:

| | Fractions | Temperature | Specific gravity at 60° F. | Baume |
|--------|-----------|-------------|----------------------------|----------------------|
| 1..... | (10%) | 535° F. | .882 | 28.7° |
| 2..... | (10%) | 600° F. | .917 | 22.7° |
| 3..... | (10%) | 655° F. | .941 | 18.8° |
| 4..... | (10%) | 676° F. | .965 | 15.1° |
| 5..... | (10%) | 738° F. | .983 | 12.4° |
| 6..... | (10%) | 760° F. | .995 | 10.7° |
| 7..... | (5%) | 765° F. | 1.005 | (heavier than water) |

The residue in the still-bottom consisted of a soft, asphaltic material, composing about 34 per cent of the original oil.

As the first two fractions of the steam distillate were very low in viscosity at ordinary temperatures, while the fractions 3 to 7 were somewhat viscous, the distillate was divided into these two portions and tested as follows:

| | Fractions 1 and 2 | Fractions 3 to 7 inclusive |
|-----------------------------------|-------------------|----------------------------|
| Specific gravity at 60° F..... | .906 | .979 |
| Baume..... | 25.0° | 13.0° |
| Flash..... | 180° F. | 285° F. |
| Cold test..... | Below -40° F. | +25° F. |
| Sulphur (S)..... | 3.69% | 4.47% |
| Nitrogen (N)..... | 0.18% | 0.31% |
| Unsaturated compounds..... | 34.71% | 50.39% |
| Viscosity, Saybolt at 100° F..... | ----- | 124 seconds |

Location of Deposits.

The areal map shows the location of the principal deposits. The data necessary for platting the different deposits was obtained by a careful survey of the different structures in and near the oil fields of Santa Barbara County, and by a study of the logs of wells drilled in this area.

Geological Conditions Governing the Deposits of Oil Shale.

The larger beds of bituminous shale appear in the lower series of the Monterey shales of the middle Miocene period and are calcareous and flinty. Due to the highly fractured state of the beds caused by folding, a reservoir for the accumulation of oil is formed. These bodies of bituminous shale are overlain with the upper series of the Monterey shales and in places the Fernando and Terrace formations.

Wells in the Santa Maria field have penetrated these beds at an average depth of 2000 feet and in the Casmalia field at a depth of approximately 700 feet, gradually becoming shallower in a northwesterly direction along the Schuman Anticline until the base of the Monterey shale is exposed and the underlying Vaqueros formation outcrops.

The relation of the bituminous shale to the overlying formations depends entirely upon the porosity of the upper shale beds due to fracturing. There are portions of the anticline where sharp folding has caused fractured zones to extend from the main body of bituminous shale to the surface and it is here that the oil from below has migrated upward, impregnating the upper bodies of shales. At these locations not only are the shales saturated with oil, but all the seams and fissures

are filled with asphalt, due to the evaporation of the higher volatile substances in the crude oil. Such conditions exist at different points on the Schuman anticline, starting at the railroad cut at Schuman Station and following the anticline in a northwesterly direction to Corralitos Canyon.

Accessibility of Deposits.

The major portion of deposits which would justify exploitation are easily accessible by wagon roads and are an average distance of two miles air line from the railroad station of Schuman.

Overburden.

The amount of overburden varies considerably on all of the deposits. A general idea of the amount of overburden on one of the largest deposits may be obtained from a study of the contour map, Plate No. 2.^c The data on overburden were obtained by digging pits until the brown shale was encountered. The overburden will offer no serious handicap during the mining of the shale, as all of the work may be open cut and can easily be stripped by steam shovels. The overburden consists of unproductive Monterey shale, overlain by a small deposit of silt and decomposed vegetable matter. This area is sparsely covered with scrub oak bushes and brush.

History of Early Operations.

Since 1900 several attempts have been made to mine the asphalt deposits of this area and it is reported that the operations were profitable, as a high grade asphalt was obtained, but in later years the oil industry and the manufacture of asphalt brought the price so low that the asphalt mines mentioned herein had to be abandoned.

One company, operating what is known as the Waldorf Mine, drove a tunnel into the hill to a distance of 1500 feet, following a fissure, which was filled with asphaltum. This mine has long since been abandoned and is now unsafe for entrance.

Companies Now Operating for Oil.

THE DAY COMPANY.

Dr. David T. Day is operating an experimental plant at the railroad cut near the station of Schuman. The Day Process is that of destructive distillation and cracking to obtain lighter oil for the purpose of making gasoline and lubricating oils. The method of mining is by open cut. Small dump cars are filled with shale and conveyed to the crusher on a small track. The shale is dumped into crusher bins and from there into crushers where it is reduced to the size of about one and one-half inches in diameter. From here it is conveyed to another bin which has an adjustable outlet determining the rate of feed to the tubular screw conveyors, as shown on the flow sheet, Plate No. 3.^d The shale travels through the three tubular screw conveyors to the retort at a predetermined rate of speed for maximum extraction of oil. As the shale enters

^cPlate No. 2—Contour map of oil shale deposits.

^dPlate No. 3—Flow sheet of Dr. Day's process.

Day shale oil plant near Schuman Station, Santa Barbara County, Cal.

the retort, where an average temperature of about 800 degrees Fahrenheit is constantly maintained, destructive distillation is begun. The higher volatiles are driven off first and continuing on down to the residium as the shale approaches the fire box. Enough carbon remains in the shale to maintain a constant heat in the fire box or combustion chamber, which slowly deposits the spent shale by means of a LaCled-Christy chain stoker to an endless-chain drag which deposits the spent shale at the dump.

As the gasses are driven off the shale upon entering the retort they follow back through the tubular screw conveyors and are partially condensed upon encountering the cold shale. As condensation takes place the incoming shale is preheated to a certain extent and given a bath of oil and as the oil is fed back towards the retort, cracking takes place, which results in a high gravity product. The average amount of oil obtained is about 30 gallons per ton of shale. According to data furnished by Dr. Day, the resultant product contains as follows:

| | |
|-------------------------|-----|
| Gasoline ----- | 30% |
| Kerosene ----- | 15% |
| Gas-oil ----- | 15% |
| Lubricants ----- | 30% |
| Residium and Loss ----- | 10% |

The crude oil contains from 1% to 3% pyridine bases.

THE N. T. U. COMPANY.

The N. T. U. Company, with offices in the Monadnock Building, San Francisco, California, has been operating for the past year on what is known as the Stokes property near Casmalia. On this property are located some of the largest deposits of oil shale in the area under consideration.

A 20-ton plant was erected for experimental purposes and the results obtained were so satisfactory that the company is now erecting a large commercial plant comprising 25 units of 40-ton capacity each, which will handle 1000 tons of shale per day. The open cut method of mining will be followed and the shale delivered to the battery of generators by means of a standard guage railway dump car of 40-tons capacity. In this process it is necessary to crush the shale to pieces of two-inch diameter. The car containing the shale from the quarry, which has been crushed to the desired size, is dumped directly into the generator.

Process Used: The principles involved in the practice of this process differ from retorting methods in that direct internal combustion on the non-oil forming combustible matter contained in the shale is utilized. The combustion is caused to travel progressively downward through a mass of shale contained in a closed chamber, thereby furnishing heat which, travelling downward in advance of combustion, creates a working zone in which the oil is distilled from the shale, either by destructive or simple distillation. None of the oil comes in contact with the hot zone of combustion, as all of it travels progressively downward in advance of the combustion to the bottom of chamber where it is recovered; whereas, in the recovery of oil from shale in all retorting

Main quarry of N. T. U. Company, near Casmalia, Santa Barbara County, Cal.

General view of plant of N. T. U. Company, near Casmalia, Santa Barbara County, Cal.

plants, the method used involves the external heating of a retort or chamber containing the charge of shale.

The process used by this company is fully patented and the patents are owned by the S. E. Company. The N. T. U. Company holds the United States license.

The process consists of a generator, condenser and scrubber. Referring to the flow sheet, Plate No. 4, the generator is first filled with oil shale and fired at the top. The top is then closed, allowing only sufficient oxygen to enter for the purpose of complete combustion. A vacuum is placed on the outlet pipes by means of an electric fan and the direction of fire brought downward through the cold shale. Sufficient vacuum is applied to regulate the proper burning of the shale for the purpose of obtaining the maximum amount of oil and gas there-

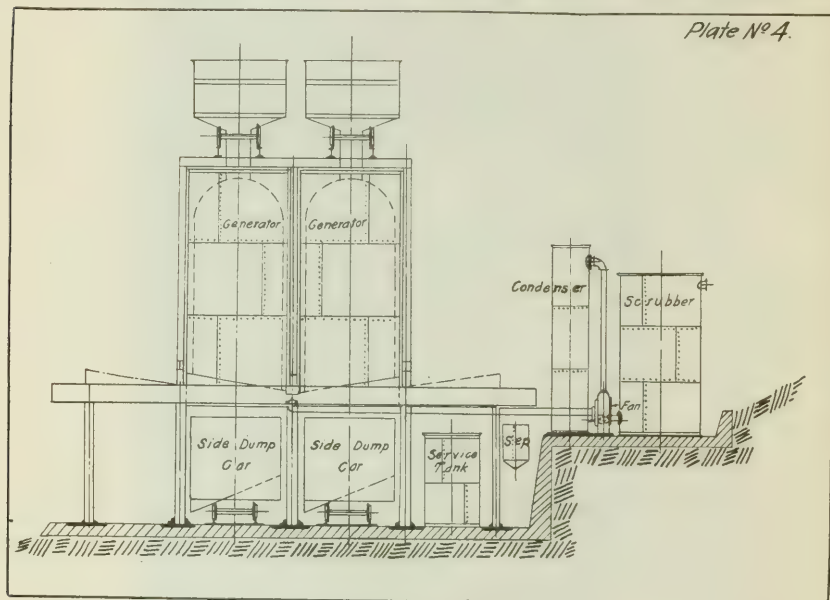

Plate No. 4—Flow sheet of N. T. U. Company's process.

from. As the gasses are driven off by heat they are partially condensed by encountering the cold shale and are further condensed when passing through the condenser and scrubber.

This process of extraction does not crack the oil excessively and as a result the crude oil contains certain properties that make it very desirable for use as flotation oil in the recovery of sulphide minerals in ores.

By this process it is reported that over 90 per cent of the total shale oil can be recovered. The gravity of the oil is about 14 degrees Baumé. As high as 40 gallons to the ton has been obtained. However, the average runs between 30 and 35 gallons to the ton.

Flotation Tests.

Hamilton, Beauchamp & Woodworth, metallurgical engineers of San Francisco, made the following tests for flotation processes:

TEST No. 1.

Flotation Using N. T. U. 'Shale' Oil.

Conditions for Flotation.

| | |
|----------------------|-------------------------------|
| Ore: | crushed wet to 80 mesh. |
| Machine: | mechanical agitation. |
| Pulp dilution: | 4:1. |
| Temperature: | normal. |
| Time of agitation: | 20 minutes. |
| Separating reagents: | lbs. per ton of ore. |
| | 1.0 " shale oil. |
| | .1 " hardwood creosote. |
| | .1 " pine oil. |
| | 4.0 " crude sodium carbonate. |

Results of Test.

| | Per cent weight | Assay | | Content | | Per cent distribution | |
|------------|-----------------|-------|-----------|---------|-----------|-----------------------|--------|
| | | Au \$ | Ag ounces | Au \$ | Ag ounces | Au | Ag |
| Head..... | 100.0 | 2.89 | 21.70 | 3.038 | 25.203 | 100.00 | 100.00 |
| Conct..... | 10.0 | 21.80 | 245.28 | 2.480 | 24.528 | 81.63 | 97.32 |
| Tail..... | 90.0 | .62 | .75 | .558 | .675 | 18.37 | 2.68 |

TEST No. 2.

Test Made July, 1921.

Conditions for Flotation.

| | |
|----------------------|--|
| Ore: | 80 mesh. |
| Machine: | mechanical agitation. |
| Pulp dilution: | 4:1. |
| Temperature: | normal. |
| Time of agitation: | 20 minutes. |
| Separating reagents: | lbs. per ton of ore. |
| | 1.0 " P. E. collector. |
| | .3 " hardwood creosote. |
| | .1 " pine oil. |
| | 4.0 " crude sodium carbonate. (Trona.) |

Results of Test.

| | Per cent weight | Assay | | Content | | Per cent distribution | |
|------------|-----------------|-------|-----------|---------|-----------|-----------------------|-------|
| | | Au \$ | Ag ounces | Au \$ | Ag ounces | Au | Ag |
| Head..... | 100.00 | 3.10 | 28.25 | 3.575 | 27.24 | ----- | ----- |
| Conct..... | 13.26 | 23.56 | 200.16 | 3.124 | 26.54 | 87.38 | 97.4 |
| Tail..... | 86.74 | .62 | .80 | .451 | .70 | 12.62 | 2.6 |

Ratio of concentration 7.54:1.

In comparing the results of the two tests, the assays of tailing should be considered rather than the percentage distribution for the reason that the difference shown in percentage extraction is entirely due to a difference in head value between the two samples tested, the tailing assays for gold and silver being almost identical in each case with a slight advantage in favor of Shale oil in the silver extraction."

The following statement as regards the advantages of the Shale oil for flotation purposes was made by Mr. Beauchamp as follows:

"The advantages in favor of 'Shale' oil, as far as the ore under investigation is concerned, seem to be that it tends toward producing a cleaner concentrate and reduces the amount of other frothing oils needed to give the right frothing condition.

Shale oil is easily mixed into the pulp with a minimum of agitation and appears to be an excellent flotation reagent."

Shale Oil vs. Commercial Crude.

It is not likely that shale oil will substitute for our present crude oil as obtained from wells for many years hence. This is due largely to the chemical properties of the shale oil. When first obtained the oil has a gravity of about 14 degrees Baumé and is very low in viscosity. It is bright green in color. When exposed to sunlight the bright green hue is lost and it becomes a dark brown with an increase in viscosity. These changes are apparently due to oxidation hastened by the catalytic effect of the high sulphur content of the oil. The removal of the sulphur compounds is the chief difficulty to be met with in refining. Aromatic hydrocarbons constitute the largest percentage of the oil. Tar acids and nitrogenous oils are present in very small quantities. Shale oil readily emulsifies with the water present in the shale during the process of extraction and is more difficult to dehydrate than the ordinary crude petroleum.

Future Possibilities of the Oil Shale Industry in California.

According to estimates made from available data there is an existing market of approximately 5,000,000 gallons per year of flotation oil. Should shale oil as produced in Santa Barbara county substitute for higher priced collective agents now in use by the mining industry, the extraction of oil from shale will be one of the important industries of this state.

The oil shale industry in its present stage of development is not comparable to the petroleum industry. The methods of obtaining and refining the oil are entirely different and the problems connected with the refining of shale oil are more complex than are those of refining petroleum.

To be successful a company formed for the purpose of producing shale oil must be sound financially and able to procure high technical and business ability. It should also be prepared to carry on exhaustive experiments and be satisfied with a very slow return on the money invested.

AGRICULTURAL MINERALS ACT.

A new state law known as the Agricultural Minerals Act was passed at the last session of the legislature. This law became operative on August 16th, and officials of the Division of Chemistry, State Department of Agriculture, are now enforcing it.

The provisions of this act are of interest to all producers of agriculture limestone, lime, marl, gypsum and other minerals used for soil treatment. The following statement prepared by officials of the Department of Agriculture has been made available through the cooperation of that department with the State Mineralogist:

AGRICULTURAL MINERALS MUST BE REGISTERED AFTER AUGUST 16th.

This law is intended to prevent fraud in the sale of agricultural lime, marl, gypsum, etc., and other minerals sold for soil treatment, and to raise the standard of such substances by requiring the labeling of every lot, giving the percentage of valuable constituents and the name of the registered producer or dealer.

Before any agricultural mineral can be legally offered for sale after August 16th, it must first be registered with the State Department of Agriculture by the producer, manufacturer, importer, agent, or dealer. If it is registered by any one of these parties no other registration is required, provided it is sold in the original, unbroken package of and under the label of the registered party. The registration fee is \$50, regardless of the items registered, and is payable at the time application for registration is made. No provision is made for remitting part of this fee for a part of the year. All registrations expire on the thirtieth day of June, 1924.

If an agricultural mineral is sold under a trade name or brand it is necessary to file with the Director of Agriculture a sworn statement of its composition. All remittances must be made payable to the State Department of Agriculture.

The scope of the law as defined in section 2 reads in part as follows:

The term 'agricultural mineral' as used in this act shall include any mineral substance, or mixture of mineral substances, or mixture of mineral and organic substances intended to be used for promoting or stimulating the growth of plants, increasing the productiveness of plants, or producing any chemical or physical change in the soil * * *.

The law, however, does not apply to minerals or mixtures containing nitrogen, phosphoric acid, or potash in commercial quantities, such as potash salts, superphosphates, nitrate of soda, nitrate of lime, cyanamid, sulphate of ammonia, etc. These must be registered under the California Fertilizer Law of 1903 as before. Raw phosphate rock and mixtures of this with lime or sulphur may be registered under either law.

Each lot of agricultural mineral must be labeled or tagged, stating:

1. Name, brand, or trade mark.
2. Name and address of the registered producer, manufacturer, importer or dealer.
3. Place of manufacture or production.
4. The word 'registered' and the registration number.

5. A chemical analysis stating the percentage of every constituent claimed to be in the product.
6. A statement of the minerals from which all guaranteed constituents are derived.

Inspectors of the department will take up samples of agricultural minerals from time to time at the quarry, at the warehouse, and in the hands of dealers and purchasers as seem necessary to determine compliance with the law.

Samples of agricultural minerals may be submitted to the department by anyone to be tested to determine compliance or not with guarantee. The fees for making these tests are to be determined by the Director of Agriculture.

In addition to license fees, the enforcement of the law is provided for by means of a tax of 10 cents on each ton sold in the state.

Noncompliance with any part of the law constitutes a misdemeanor punishable by a fine of \$50 for the first offense and \$100 for each subsequent offense.

Section 10 reads as follows: "The Director of Agriculture shall have the power, after hearing, to cancel the registration of, or to refuse to register, any agricultural mineral which has been shown to have little or no value for the purpose for which it is intended to be used, or has been shown to be generally detrimental or seriously injurious to the growth or productiveness of plants."

Parties desiring further information should write to the Division of Chemistry, State Department of Agriculture, Sacramento, California.

ADMINISTRATIVE DIVISION.

WALTER W. BRADLEY, Deputy State Mineralogist.

New District Office.

In line with the efficiency and economy program of the new state administration, the State Mineralogist decided upon the closing of the Redding and Auburn district branch offices of the State Mining Bureau, and their consolidation into a single office located in Sacramento. This was accomplished in June.

The use of office space in the Chamber of Commerce Building, Seventh street, between I and J, was made possible through the cordial cooperation of the Sacramento Chamber of Commerce, which has established a Department of Mines and Mining and is showing every disposition to aid the mining industry of the state by such means as are within its province. For this, the State Mining Bureau and the mining industries are duly appreciative. Historically and geographically, the principal mining districts of central California are and have always been the 'back country' of the capital city, and it is gratifying that the business men of the city have come to realize that the prosperity of the mines at their back door is a matter of business interest to themselves.

The new office of the Bureau at Sacramento will make available for public use in a central location a general information bureau on the mines and the undeveloped mineral resources of the state. There will also be kept at the office, for public reference, practically every geological and mining report issued by the government bureaus dealing with the state's mineral resources, and many maps and reference books of value.

New Publications.

During the period covered by this issue (March 16-September 15) the following Bureau publications have been made available for distribution:

Bulletin No. 91, "Minerals of California"; price \$1.00 post paid.

The first list of California's minerals was published by W. P. Blake in 1866, and it comprised about seventy-five mineral species. California was at that time a new and largely unexplored field, and only a few scattered localities were known for mineral specimens.

The second list appeared in 1884 as a part of the Fourth Annual Report of the State Mineralogist, by Henry G. Hanks; and included double the number of previously known minerals.

A third list was issued in 1914 as Bulletin 67 of the State Mining Bureau, written by Dr. A. S. Eakle, professor of mineralogy at the University of California. In the thirty years which had elapsed since the appearance of the second list our knowledge of geology and mineralogy of the state had vastly increased. The ore deposits of many of the counties, the gem and borate deposits of the southern counties, and the petrography of many districts, had been investigated and described, so that the third list contained more than double the number of definite mineral species given by Hanks, besides many sub-species and varieties.

Publication of a fourth list is now accomplished, being an enlarged and revised edition of the third list and likewise written by Professor Eakle. It has been designated Bulletin 91 of the State Mining Bureau, entitled "Minerals of California." In addition to increases in the number of Californian localities of mineralogic interest, the number of mineral species not hitherto reported in California is considerably increased. One of the new minerals, troilite, has never previously been found on the earth except in meteorites. A new feature of Bulletin 91, not given in previous editions, is the addition of the principal blow-pipe and chemical identification tests for each mineral.

Summary of Operations, California Oil Fields, Vol. 8 : December, 1922, No. 6 ; January, 1923, No. 7 ; February, 1923, No. 8 ; March, 1923, No. 9 ; April, 1923, No. 10 ; May, 1923, No. 11.

Mining in California, December, 1922, Vol. 18, No. 12.

Mining in California, January, 1923, Vol. 19, No. 1 ; February, 1923, Vol. 19, No. 2 ; March, 1923, Vol. 19, No. 3.

Map No. 28, Torrance (Redondo) Oil Field ; price 75 cents.

Commercial Mineral Notes: No. 1, April ; No. 2, May ; No. 3, June ; No. 4, July ; No. 5, August.

As the timeliness of publication is important in the case of the lists of 'mineral deposits wanted' and 'minerals for sale,' it was decided to issue that information in the form of a mimeograph sheet once a month, since the change to a quarterly status of 'Mining in California' which formerly was the vehicle for disseminating such information. This list is mailed, free of charge, to those on the mailing list for 'Mining in California.'

Mails and Files.

The Bureau maintains, in addition to its correspondence file, a mine report file which includes reports on some 7500 mines and mineral properties in California. Also there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the past three months 3726 letters were received and answered. They are practically all requests for information and the inquiries cover all phases of prospecting, mining and developing mineral deposits, reduction of crude minerals, and marketing of refined products.

Drafting Room.

This is purely a workshop, and is the only branch of the Bureau that is not primarily at the direct service of the public. In the drafting room well logs, maps, sketches, etc., are prepared for the many publications and reports which are under way at all times.

Changes in Personnel.

Since the March issue of 'Mining in California' the following changes in personnel have taken place:

Mr. R. E. Collom, state oil and gas supervisor since January, 1921, has resigned, effective October 1st, to engage in private practice.

Mr. R. D. Bush has been appointed state oil and gas supervisor, vice R. E. Collom resigned. Mr. Bush received his technical training at the University of California, was a deputy and chief deputy oil and gas supervisor of this department 1917-1920, and the past three years has been engaged in technical work with the Empire Gas and Fuel Company in the oil fields of Kansas.

Mr. M. A. Newman, for the past year district mining engineer in charge of the southern district, with offices at Los Angeles, resigned in June, to engage in private practice.

Mr. W. Burling Tucker, district mining engineer in charge of the Redding district, has been transferred to the Los Angeles office of the Bureau.

Mr. C. A. Logan, for the past four years in charge of the Auburn district, has been transferred to Sacramento, in charge of the new district formed by consolidation of the Redding and Auburn districts.

Mr. Forest L. Campbell, a graduate of the University of California in mining engineering, has been appointed librarian of the Bureau, and is in charge of the information desk at the San Francisco office.

Mr. J. J. McDonald, for the past eight years assistant mining statistician, resigned in May, to engage in private business.

DIVISION OF MINERALS AND STATISTICS.

WALTER W. BRADLEY, Deputy State Mineralogist.

STATISTICS.

MINERAL PRODUCTION OF CALIFORNIA IN 1922.

Compilation of the direct returns to the State Mining Bureau from the various operators throughout the state show the total aggregate value of the mineral output of California for the year 1922 to have been \$245,183,826, being a decrease of \$22,973,646 from the 1921 total of \$268,157,472. There were fifty-three different mineral substances, exclusive of a segregation of the various stones grouped under gems; and all of the fifty-eight counties of the state contributed to the list.

The salient features of 1922 compared with the preceding year, were: The continued increase in petroleum yield, although of lower prices per barrel; increases in copper, lead, natural gas, brick and tile, and crushed rock; and decreases in gold, silver, cement, and petroleum values. The net result was a decrease in the grand total of all groups of nearly twenty-three million dollars, as stated above. Petroleum accounted for a decrease of \$29,756,960 in total value, although there was an increase in quantity of approximately 26,000,000 barrels.

Of the metals: copper increased from 12,088,053 pounds, worth \$1,559,358, to 22,883,987 pounds, worth \$3,090,582; lead, from 1,149,051 pounds and \$51,707, to 6,511,280 pounds and \$358,120; zinc, quick-silver, platinum, and iron ore also showed increases. Gold decreased from \$15,704,822 to \$14,670,346, in spite of which in 1922 California accounted for approximately 30 per cent of the gold output of the United States.

Of the structural group: brick and tile increased in value from \$5,570,875 to \$7,994,991; miscellaneous stone (comprising crushed rock, sand and gravel, paving blocks) from \$7,834,640 to \$10,377,783; magnesite, lime, marble, and onyx also increasing; cement, although increasing from 7,404,221 barrels to 8,962,135 barrels in output, decreased from \$18,072,120 to \$16,524,056 in value. Slate again joined the active list with a small yield.

In the 'industrial' group, there were a number of fluctuations, the more important increases being shown by mineral water, pottery clay, gypsum, and pyrites; and decreases by diatomaceous earth, and limestone. Two new items were added in 1922 to this list, not previously produced commercially in California, namely: shale oil and sillimanite. In the saline group, potash and soda increased, with borates, magnesium salts, salt, and calcium chloride, decreasing.

Details of the 1922 production data are published in our Bulletin 93.

The following table shows the comparative yield of mineral substances of California for 1921 and 1922 as compiled from the returns received at the State Mining Bureau, San Francisco, in answer to inquiries sent to producers:

| Substance | 1921 | | 1922 | |
|---|-----------------------|---------------|------------------------|---------------|
| | Amount | Value | Amount | Value |
| Asbestos..... | 410 tons | \$19,275 | 50 tons | \$1,800 |
| Barytes..... | 901 tons | 4,809 | 3,370 tons | 18,925 |
| Bituminous rock..... | 8,298 tons | 43,192 | 4,624 tons | 13,570 |
| Borates..... | 50,136 tons | 1,096,326 | 139,087 tons | 1,068,025 |
| Calcium chloride..... | 683 tons | 22,980 | (3) | (3) |
| Cement..... | 7,404,221 bbls. | 18,072,120 | 8,962,135 bbls. | 16,524,056 |
| Brick and tile..... | | 5,570,875 | | 7,994,991 |
| Chromite..... | 347 tons | 6,870 | 379 tons | 6,334 |
| Clay (pottery)..... | 225,120 tons | 362,172 | 277,232 tons | 473,184 |
| Coal..... | 12,467 tons | 63,578 | 27,020 tons | 135,100 |
| Copper..... | 12,088,053 lbs. | 1,559,358 | 22,883,987 lbs. | 3,090,582 |
| Dolomite..... | 31,195 tons | 99,155 | 52,409 tons | 114,911 |
| Feldspar..... | 4,349 tons | 28,343 | 4,587 tons | 37,109 |
| Fuller's earth..... | 1,185 tons | 8,295 | 6,606 tons | 48,756 |
| Gems..... | | 10,954 | | 1,312 |
| Gold..... | | 15,704,822 | | 14,670,346 |
| Granite..... | | 725,901 | | 676,643 |
| Graphite..... | (2) | (2) | (3) | (3) |
| Gypsum..... | 37,412 tons | 78,875 | 47,084 tons | 188,336 |
| Infusorial and diatomaceous earths..... | (2) | (2) | (3) | (3) |
| Iron ore..... | 1,970 tons | 12,030 | 3,588 tons | 18,868 |
| Lead..... | 1,149,051 lbs. | 51,707 | 6,511,280 lbs. | 358,120 |
| Lime..... | 463,534 bbls. | 610,619 | 578,748 bbls. | 671,747 |
| Limestone..... | 75,921 tons | 305,912 | 84,382 tons | 282,181 |
| Lithia..... | (2) | (2) | (3) | (3) |
| Magnetite..... | 47,837 tons | 511,102 | 55,637 tons | 594,665 |
| Magnesium salts..... | 4,153 tons | 106,140 | 3,036 tons | 89,788 |
| Manganese ore..... | 1,005 tons | 12,210 | 540 tons | 7,650 |
| Marble..... | 30,232 cu. ft. | 98,395 | 38,321 cu. ft. | 127,792 |
| Mineral paint..... | 446 tons | 4,748 | 1,620 tons | 13,277 |
| Mineral water..... | 3,446,278 gals. | 367,476 | 4,276,346 gals. | 486,424 |
| Natural gas..... | 67,043,797 M. cu. ft. | 4,704,678 | 103,628,027 M. cu. ft. | 6,990,030 |
| Onyx..... | 2,569 cu. ft. | 1,294 | 10,950 cu. ft. | 3,320 |
| Petroleum..... | 112,599,860 bbls. | 203,138,225 | 138,468,222 bbls. | 173,381,265 |
| Platinum..... | 613 fine oz. | 58,754 | 795 fine oz. | 90,288 |
| Potash..... | 14,806 tons | 390,210 | 17,776 tons | 584,388 |
| Pumice and volcanic ash..... | 406 tons | 6,310 | 613 tons | 4,248 |
| Pyrites..... | 110,025 tons | 473,735 | 151,381 tons | 570,425 |
| Quicksilver..... | 3,157 flasks | 140,666 | 3,466 flasks | 191,851 |
| Salt..... | 197,989 tons | 832,702 | 223,238 tons | 819,187 |
| Sandstone..... | 10,150 cu. ft. | 2,112 | 900 cu. ft. | 1,100 |
| Shale oil..... | | | (3) | (3) |
| Silica (sand and quartz)..... | 10,569 tons | 49,179 | 9,874 tons | 31,016 |
| Sillimanite..... | | | (3) | (3) |
| Silver..... | | 3,629,223 | | 3,100,065 |
| Slate..... | | | (3) | (3) |
| Soapstone and talc..... | 8,752 tons | 130,078 | 13,378 tons | 197,186 |
| Soda..... | 14,828 tons | 438,996 | 20,084 tons | 573,661 |
| Stone, miscellaneous..... | | 7,834,640 | | 10,377,783 |
| Zinc..... | 846,184 lbs. | 42,309 | 3,034,430 lbs. | 172,963 |
| Unapportioned..... | | 726,122 | | 380,558 |
| Total values..... | | \$268,157,472 | | \$245,183,826 |

(1) Recalculated to 40 per cent 'anhydrous boric acid' equivalent.

(2) Unapportioned—includes graphite, diatomaceous earth, and lithia.

(3) Unapportioned—includes calcium chloride, graphite, diatomaceous earth, lithia, shale oil, sillimanite, and slate.

(4) Includes macadam, ballast, rubble, riprap, paving blocks, sand, gravel, and grinding-mill pebbles.

The following table shows the comparative value of the mineral production of the various counties in the state, for the years 1921 and 1922:

| County | 1921 | 1922 |
|----------------------|---------------|---------------|
| Alameda..... | \$1,353,690 | \$2,041,454 |
| Alpine..... | 925 | 2,800 |
| Amador..... | 2,368,464 | 2,479,063 |
| Butte..... | 669,830 | 720,625 |
| Calaveras..... | 1,525,201 | 1,502,883 |
| Colusa..... | 80,438 | 75,934 |
| Contra Costa..... | 1,622,732 | 2,397,312 |
| Del Norte..... | 6,029 | 6,261 |
| El Dorado..... | 112,756 | 184,525 |

Total Mineral Production of California, by Years.

The following tabulation gives the total value of mineral production of California by years since 1887, in which year compilation of such data by the State Mining Bureau began. At the side of these figures the writer has placed the values of the most important metal and non-metal items—gold and petroleum.

In the same period copper made an important growth beginning with 1897 following the entry of the Shasta County mines, and more recently Plumas County. Cement increased rapidly from 1902, while crushed rock, sand and gravel as a group parallels the cement increase. Quicksilver has been up and down. Mineral water and salt have always been important items, but the values fluctuate. Borax has increased materially since 1896. War-time increases, 1915–1918, were shown by chromite, copper, lead, magnesite, manganese, silver, tungsten and zinc. Most of these, except silver, have since declined; with structural materials and copper increasing in 1920–1922.

Total Mineral Production of California by Years, Since 1887.

| Year | Total value of all minerals | Gold, value | Petroleum, value |
|--------|--------------------------------|---------------|---------------------|
| 1887 | \$19,785,868 | \$13,588,614 | \$1,357,144 |
| 1888 | 19,469,320 | 12,750,000 | 1,380,666 |
| 1889 | 16,681,731 | 11,212,913 | 368,048 |
| 1890 | 18,039,666 | 12,309,793 | 384,200 |
| 1891 | 18,872,413 | 12,728,869 | 401,264 |
| 1892 | 18,300,168 | 12,571,900 | 561,333 |
| 1893 | 18,811,261 | 12,422,811 | 608,092 |
| 1894 | 20,203,294 | 13,923,281 | 1,064,521 |
| 1895 | 22,844,663 | 15,334,317 | 1,000,235 |
| 1896 | 24,291,398 | 17,181,562 | 1,180,793 |
| 1897 | 25,142,441 | 15,871,401 | 1,918,269 |
| 1898 | 27,289,079 | 15,906,478 | 2,376,420 |
| 1899 | 29,313,460 | 15,336,031 | 2,660,793 |
| 1900 | 32,622,945 | 15,863,355 | 4,152,928 |
| 1901 | 34,355,981 | 16,989,044 | 2,961,102 |
| 1902 | 35,069,105 | 16,910,320 | 4,692,189 |
| 1903 | 37,759,040 | 16,471,264 | 7,313,271 |
| 1904 | 43,778,348 | 19,109,600 | 8,317,809 |
| 1905 | 43,069,227 | 19,197,043 | 9,007,820 |
| 1906 | 46,776,055 | 18,732,452 | 9,238,020 |
| 1907 | 55,697,949 | 16,727,928 | 16,783,943 |
| 1908 | 66,363,198 | 18,761,559 | 26,566,181 |
| 1909 | 82,972,209 | 20,237,870 | 32,398,187 |
| 1910 | 88,419,079 | 19,715,440 | 37,689,542 |
| 1911 | 87,497,879 | 19,738,908 | 40,552,088 |
| 1912 | 88,972,385 | 19,713,478 | 41,868,344 |
| 1913 | 98,644,639 | 20,406,958 | 48,578,014 |
| 1914 | 93,314,773 | 20,653,496 | 47,487,109 |
| 1915 | 96,663,369 | 22,442,296 | 43,503,837 |
| 1916 | 127,901,610 | 21,410,741 | 57,421,334 |
| 1917 | 161,202,962 | 20,087,504 | 86,976,209 |
| 1918 | 199,753,837 | 16,529,162 | 127,459,221 |
| 1919 | 195,830,002 | 16,695,955 | 142,610,563 |
| 1920 | 242,099,667 | 14,311,043 | 178,394,937 |
| 1921 | 268,157,472 | 15,704,822 | 203,138,225 |
| 1922 | 245,183,826 | 14,670,346 | 173,381,265 |
| Totals | \$2,751,150,349 | \$602,218,554 | \$1,365,753,916 |

MUSEUM.

The Museum of the State Mining Bureau possesses an exceptionally fine collection of rocks and minerals of both economic and academic value. It ranks among the first five of such collections located in North America; and contains not only one or more samples of most of the known minerals found in California, but many specimens from other states and foreign countries as well.

Mineral specimens suitable for exhibit purposes are solicited, and their donation will be appreciated by the State Mining Bureau as well as by those who utilize the facilities of the collection. The Bureau supplies a set of forty typical minerals and ores, appropriately labeled, for study purposes to any public school in the state upon request.

LABORATORY.

FRANK SANBORN, Mineral Technologist.

During the five-month period covered by this report 1584 samples were received and determined at the laboratory of the Bureau. These samples were of great variety; salines, precious metals, and gem stones being received and recorded as having a possible commercial value.

A rather large demand has been created during recent months for colored rocks suitable as a 'dash' in stucco work. To be desirable for this, the material should be hard, compact, and of a pleasing color. Red, green, yellow, and black are the colors usually desired, but there are others that would probably be suitable for such decorative work. There is the blue dumortierite and glaucophane-schist, the pistachio-green epidote and epidosite, rocks having the properties of reflecting light, such as micaceous hematite and some mica-schist. These and many other rocks and minerals if once introduced as ornamental stones in certain types of buildings, would possibly be a means by which the use of colored stones could be increased, and a market found for many rocks having no commercial value at present.

The demand for pyrite and galena making good radio crystals is still active. Sensitive crystals are worth between 50 cents and \$1 per pound at the mine. This laboratory is not equipped for making tests for sensitiveness.

LIBRARY.

FOREST L. CAMPBELL, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the State are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

- Prof. Paper No. 131-G—Fossil Plants from the Tertiary Lake Beds of South Central Colorado. By F. H. Knowlton.
- Prof. Paper No. 131-H—The Fauna of the So-called Dakota Formation of Northern Central Colorado and Its Equivalent in Southeastern Wyoming. By John B. Reeside, Jr.
- Prof. Paper No. 132-A—Rock Formations in the Colorado Plateau of Southeastern Utah and Northern Arizona. By C. R. Longwell et al.
- Water-Supply Paper No. 488—The Floods in Central Texas in September, 1921. By C. E. Ellsworth.
- Water-Supply Paper No. 493—Hydroelectric Power Systems of California and Their Extension Into Oregon and Nevada. By Frederick Hall Fowler.
- Water-Supply Paper No. 504—Surface Water Supply of the United States, 1919-1920. Part IV—St. Lawrence River Basin. By Nathan C. Grover and others.
- Water-Supply Paper No. 496—The Industrial Utility of Public Water Supplies in the United States. By W. D. Collins.
- Water-Supply Paper No. 469—Surface Waters of Wyoming and Their Utilization. By Robert Follansbee.
- Water-Supply Paper No. 495—Geology and Ground Water Resources of Sacramento Valley, California. By Kirk Bryan.
- Water-Supply Paper No. 512—Surface Water Supply of the U. S., 1919 and 1920. Part XII—North Pacific Slope Drainage Basins. A. Pacific Basins in Washington and Upper Columbia River Basin. By Nathan C. Grover and others.
- Water-Supply Paper No. 501—Surface Water Supply of the United States, 1919-1920. Part I—North Atlantic Slope Drainage Basin. By Nathan C. Grover and others.
- Water-Supply Paper No. 510—Surface Water Supply of the United States, 1919-1920. Part X—The Great Basin. By Nathan C. Grover and others.
- Mineral Resources of the United States:
- Chromite in 1922. By Edward Sampson.
- Preliminary Summary, 1922.
- Asbestos in 1922. By Edward Sampson.
- Coke and By-products in 1921. By R. S. McBride.
- Gold, Silver, Copper, Lead and Zinc in the Eastern States in 1922. By J. P. Dunlap.
- Part 1. Metals.
- Part 1. Bismuth, Selenium, and Tellurium in 1922. By Victor C. Heickes.
- Lead in 1922. By C. E. Siebenthal and A. Stoll.
- Zinc in 1922. By C. E. Siebenthal and A. Stoll.
- Asphalt and Related Bitumens in 1922. By K. W. Cottrell.
- Part 1. Bauxite and Aluminum in 1922. By James M. Hill.
- Salt, Bromine and Calcium Chloride in 1922. By K. W. Cottrell.
- Fluorspar and Cryolite in 1922. By Hubert W. Davis.
- Antimony in 1922. By Frank C. Schrader.
- Peat in 1922. By K. W. Cottrell.
- Petroleum in 1919-1921. By G. B. Richardson.
- Lead and Zinc Pigments and Salts in 1922. By C. E. Siebenthal and A. Stoll.
- Iron Ore, Pig Iron and Steel in 1921. By Ernest F. Burchard and Hubert W. Davis.
- Fuel Briquets in 1922. By W. F. McKenney.
- Cadmium in 1922. By C. E. Siebenthal and A. Stoll.
- Natural Gas in 1919-1921. By B. S. McBride and E. G. Sievers.

U. S. Department of Commerce, Commerce Reports April 9-16; May 7, 14, 21, 28; June 4, 1923:

Monthly Summary of Foreign Commerce of the United States, Part II, December, 1922, and January, 1923.

Monthly Summary of Foreign Commerce of the United States, Part II, February, 1923.

Monthly Summary of Foreign Commerce of the United States, Part I, April, 1923.

Monthly Summary of Foreign Commerce of the United States, Part II, March, May, June, July and August, 1923.

U. S. Coast Geodetic Survey:

Serial No. 216—Use of Geodetic Control for City Surveys. By Hugh C. Mitchell.

Serial No. 225—Reconnaissance and Signal Building. By Jasper S. Bilby.

Smithsonian Institution United States National Museum:

Bulletin No. 100, Vol. 3—Contributions to the Biology of the Philippine Archipelago and Adjacent Regions. By Rene Koehler.

Bulletin No. 123—Revision of The North American Moths of the Subfamily Eucosminae of the Family Olethrentidae. By Carl Heinrich.

Bulletin No. 124—The Type Species of the Genera of Chalcidiordea or Chalcid-flies. By A. B. Gahan and Margaret M. Fagen.

Smithsonian Institution, Annual Report, 1921:

U. S. National Museum—Bulletin No. 102, Part 8, Manufactured Gas in the Home. By Samuel S. Wyer.

U. S. National Museum—Proceedings of the United States National Museum, Vol. 61.

U. S. National Museum—Bulletin No. 126, Life Histories of North American Wild Fowl. By Arthur Cleveland Bent.

Bulletin No. 120—The Opolinid Ciliate Infusorians. By Maynard M. Metcalf.

Bulletin No. 125—North American Later Tertiary and Quarternary. By Ferdinand Canu and Ray S. Bassler.

Trees and Shrubs of Mexico. By Paul C. Standley.

Catalogue of the Watercraft Collection in the United States National Museum. By Carl W. Mitman.

U. S. Bureau of Mines:

Bulletin No. 211—The Chloride Volatilization Process of Ore Treatment. By Thomas Varley and Robert H. Bradford, E. P. Barrett and C. C. Stevenson.

Bulletin No. 213—Talc and Soapstone, Their Mining, Milling, Products and Uses. By Raymond B. Ladoo.

Bulletin No. 216—Bibliography of Petroleum and Allied Substances in 1919-1920. By E. H. Burroughs.

Bulletin No. 217—Preparation, Treatment and Combustion of Powdered Coal. By John Blizard.

Bulletin No. 204—Underground Ventilation at Butte. By D. Harrington.

Bulletin No. 219—Explosives, Their Materials, Constitution and Analysis. By C. A. Taylor and Wm. H. Rinkenbach.

Technical Paper No. 300—The Universal and the Fireman's Gas Masks. By S. H. Katz, J. J. Bloomfield and A. C. Fieldner.

Technical Paper No. 331—Metal Mine Accidents in the United States During the Calendar Year 1921. By William W. Adams.

Technical Paper No. 328—The Motor Gasoline Surveys of 1920 and 1921. By N. A. C. Smith.

Technical Paper No. 326—Fire in Steamship Bunker and Cargo Coal. By H. H. Soek.

Technical Paper No. 333—Permissible Explosives, Mining Equipment and Apparatus Approved Prior to January 1, 1923. By S. P. Howell et al.

Technical Paper No. 334—Mine Rescue Standards. A Tentative Study.

Technical Paper No. 339—Coal Mine Fatalities in the United States, 1922. By William W. Adams.

- Technical Paper No. 340—Production of Explosives in the United States during the Calendar Year 1922. By William W. Adams.
- Technical Paper No. 283—Tests of Low Grade and Complex Ores in Colorado. By Will H. Coghill and C. O. Anderson.
- Technical Paper No. 294—Progress of Investigations on Liquid-Oxygen Explosives. By S. P. Howell et al.
- Technical Paper No. 315—Comparative Tests of By-Product Coke and Other Fuels for House-Heating Boilers. By Henry Kreisinger et al.
- Technical Paper No. 321—Anhydrous Aluminum Chloride. By Oliver C. Ralston.

Reports of Investigations:

- Serial No. 2462—The Treatment of Natural-Gas Gasoline to Meet the Doctor Test. By D. B. Dow (Associate Organic Chemist, B. M.).
- Serial No. 2463—Utilization of Waste Rock at Lime Plants. By Oliver Bowles (Mineral Technologist, B. M.).
- Serial No. 2464—Physiological Effect of High Temperatures and Humidities With and Without Air Movement. By R. R. Sayers (Chief Surgeon, U. S. B. M., Surgeon U. S. Public Health Service) and D. Harrington (Supervising Mining Engineer, B. M.).
- Serial No. 2465—Mine Timber in Illinois Coal Mines. By Harry E. Tuft (Mining Engineer, U. S. B. M.).
- Serial No. 2466—An Economic Study of the New Albany Shale. By John R. Reeves (Department of Geology, Indiana University).
- Serial No. 2467—Additions, Removals and Changes in Permissible List of Explosives from December 31, 1922, to March 15, 1923. By S. P. Howell (Explosives Engineer, B. M.).
- Serial No. 2468—Monel Metal as a Material for Flame Safety Lamp Gauzes. By A. B. Hooker (Assistant Electrical Engineer, B. M.), and R. A. Kearns (Junior Electrical Engineer, B. M.).
- Serial No. 2469—The Desulphurization of Coke by Air. By Alfred R. Powell (Associate Chemist, Pittsburgh Experiment Station, B. M., Department of the Interior).
- Serial No. 2470—Combustion of Powdered Coal. By Henry Kreisinger (Research Engineer, Combustion Engineering Corp.) and John Blizzard (Fuel Engineer, U. S. B. M.).
- Serial No. 2471—Explosives Used in February, 1923. By W. W. Adams (Statistician, B. M.).
- Serial No. 2472—Coal Mine Fatalities in March, 1923. By W. W. Adams (S. B. M.).
- Serial No. 2473—Globe-Miami Mine Rescue Maneuvers. By E. D. Gardner (Mining Engineer, Department of the Interior, Bureau of Mines).
- Serial No. 2474—Approval System of the Interior Department, Bureau of Mines, as Applied to Permissible Storage-Battery Locomotives. (Second Complete Investigation under Schedule 15.) By L. C. Ilsley (Electrical Engineer, Pittsburgh Experiment Station, Department of the Interior, Bureau of Mines) and H. B. Brunot (Junior Electrical Engineer, Pittsburgh Experiment Station, Department of the Interior, Bureau of Mines).
- Serial No. 2475—The Metallurgical Treatment of Zinc Retort Residues. By B. M. O'Harra (Associate Metallurgist, Department of the Interior, Bureau of Mines).
- Serial No. 2476—Dangers of and Treatment for Carbon Monoxide Poisoning. By R. R. Sayers (Chief Surgeon of Bureau of Mines, Department of the Interior, and Surgeon of Public Health Service, Treasury Department), and W. P. Yant (Associate Chemist, Pittsburgh Experiment Station of Bureau of Mines, Department of the Interior).
- Serial No. 2477—Barite and Ocher in the Cartersville, Georgia, District. By W. M. Weigel (Mineral Technologist of the Bureau of Mines, Department of the Interior).
- Serial No. 2478—Explosives Used in March, 1923. By W. W. Adams (Statistician, Bureau of Mines).
- Serial No. 2479—Quarrying to Obtain a Uniform Lime Product. By Oliver Bowles (Mineral Technologist, Bureau of Mines).
- Serial No. 2480—Fluorspar Mining in the Western States. By Raymond B. Ladoo (Mineral Technologist, U. S. Bureau of Mines).

- Serial No. 2481—Explosion-Proof Coal-Cutting Equipments Approved Prior to January 1, 1923 (Supplementary to Bulletin 78). By E. J. Gleim (Associate Electrical Engineer, Pittsburg Experiment Station, U. S. Bureau of Mines).
- Serial No. 2482—Survey of Pacific Coast Petroleum Products. Part 2. Lubricating Oils. By Earl C. Lane (Assistant Chemist, Bureau of Mines) and N. F. LeJeune (Assistant Chemist, Bureau of Mines).
- Serial No. 2483—Coal Mine Fatalities in April, 1923. By W. W. Adams (Statistician, Bureau of Mines).
- Serial No. 2484—Why Not Scrap 'The Davy'? By J. W. Paul and A. B. Hooker.
- Serial No. 2485—The Reduction of Iron Oxides by Fuel Gases. By E. D. Eastman.
- Serial No. 2486—The Pyro Tannic Acid Method for the Quantitative Determination of Carbon Monoxide in Blood and Air. By R. R. Sayers, W. P. Yant, and G. W. Jones.
- Serial No. 2487—Gasoline Saved on Government Trucks by Adjusting Carburetors by Exhaust Gas Analysis. By G. W. Jones and A. C. Fieldner.
- Serial No. 2488—Who May Set Off Blasts in Coal Mines? By L. C. Ilsley.
- Serial No. 2489—Comparison of Gas Masks, Hose Masks, and Oxygen-Breathing Apparatus. By S. H. Katz and J. J. Bloomfield.
- Serial No. 2490—Explosives Used in April, 1923. By W. W. Adams.
- Serial No. 2491—Hydrogen Sulphide as an Industrial Poison. By R. R. Sayers, C. W. Mitchell and W. P. Yant.
- Serial No 2492—Results of Assays of the New Albany Oil-Shale. By John R. Reeves.
- Serial No. 2493—The Wheat Electric Cap Lamp, Approval No. 17. By L. C. Ilsley and A. B. Hooker.
- Serial No. 2494—Atmospheric Conditions and Physiological Effects Produced on Trainmen by Locomotive Smoke in the Aspen and the Wahsatch Tunnels of the Union Pacific Railroad. By S. P. Kinney.
- Serial No. 2495—Coal Mine Fatalities in May, 1923. By W. W. Adams.
- Serial No. 2496—Platinum Assays and Platinum Promotions. By S. C. Lind, C. W. Davis and M. W. von Bernewitz.
- Serial No. 2497—Gases Liberated by High-Voltage Insulator Testing Apparatus. By G. W. Jones and W. P. Yant.
- Serial No. 2498—Disastrous Inflammation of Coal Dust in Excavating a Mine Dump. By C. A. Herbert.
- Serial No. 2499—Carbon Tetrachloride Extinguisher on Electric Fires. By S. H. Katz, E. J. Gleim and J. J. Bloomfield.
- Serial No. 2500—The 'Model E' Edison Electric Cap Lamp. Approval No. 18. By L. C. Ilsley and A. B. Hooker.
- Serial No. 2501—Explosives Used in May, 1923. By W. W. Adams.
- Serial No. 2502—The Use of Oxygen or Oxygenated Air in Metallurgical and Allied Processes. By F. W. Davis.
- Serial No. 2503—Some General Considerations of the Gummy Meter Problem in the Gas Industry. By Ralph L. Brown.
- Serial No. 2504—Test Papers for Estimating Hydrocyanic Acid Gas in Air. By S. H. Katz and E. S. Longfellow.
- Serial No. 2505—Sulphur Trioxide Smoke Tubes for Determining Air Currents. By S. H. Katz and J. J. Bloomfield.
- Serial No. 2506—Field Investigation on Trailing Cables Used on Coal-Cutting Outfits. By L. C. Ilsley and H. B. Freeman.
- Serial No. 2507—Oxygen-Oil Explosions. By Mayo D. Hersey.
- Serial No. 2508—Coal Mine Fatalities in June, 1923. By W. W. Adams.
- Serial No. 2509—Experiments on Fan-Pipe Installations at Butte, Montana. By G. E. McElroy and A. S. Richardson.

State of California, Department of Public Works:

Bulletin No. 1—Hydrographic Investigation of San Joaquin River.

Bulletin No. 4—Water Resources of California.

Bulletin No. 5—Flow in California Streams.

Bulletin No. 6—Irrigation Requirements of California Lands.

First Biennial Report of the Department of Public Works, State of California, 1922.

State of California, Board of Forestry :

Circular No. 7—The Forest Situation in California in 1923.

Twentieth Biennial Report of the Bureau of Labor Statistics of the State of California, 1921-1922.

Geological Survey of Alabama, County Report No. 1—Geology and Mineral Resources of Clay County. By William Frederick Prouty.

Geological Survey of Georgia, Bulletin No. 40—Oil and Gas in Georgia. By T. M. Prettyman and H. S. Cave.

State of Colorado, Bureau of Mines, Annual Report, 1922.

Bureau of Mines and Geology, Idaho, Pamphlet No. 6—A Preliminary Study of Certain Reported Platinum Occurrences Near Coeur D'Alene, Idaho.

Pamphlet No. 5—Reconnaissance :

A Preliminary Reconnaissance of the Gas and Oil Possibilities of South-eastern and South-Central Idaho. By John P. Buwalda.

Iowa Geological Survey, Vol. XXVIII—Gypsum.

Kentucky Geological Survey, Geology of the Princeton Quadrangle. By Stuart Weller.

Kentucky Geological Society—The Geography of the Jackson Purchase. By Darrell Haug Davis.

Mississippi State Geological Survey, Bulletin No. 18—A Questionnaire on the Mineral Resources of Mississippi and the Work of the State Geological Survey. By E. N. Lowe, State Geologist.

North Carolina Geological and Economic Survey, Circular No. 7—Forest Fires and the Boll-Weevil. By Fred B. Merrill.

Circular No. 8—North Carolina Drainage Law.

Circular No. 5—Amendments to the North Carolina Drainage Law. Passed by the General Assemblies of 1921 and 1923.

Circular No. 6—The Water Power Situation in North Carolina. By Thorndike Saville.

Commonwealth of Pennsylvania :

Bulletin No. 71—Copper Ores in Pennsylvania. By J. Ross Corbin.

Bulletin No. 72—Flagstone Industry in Northeastern Pennsylvania. By R. W. Stone.

Bulletin No. 73—Oil and Gas Sands in the North Half of the Pittsburgh Quadrangle, Penn. By M. E. Johnson.

Bulletin No. 74—Chromite in Pennsylvania. By J. Ross Corbin.

Bulletin No. 75—Rocks of the Quarryville Quadrangle. By Anna I. Jones.

Bulletin No. 76—Calcareous Marl in Pennsylvania, South of the Terminal Moraine. By J. B. R. Dickey.

Bulletin No. 77—Gold in Pennsylvania. By J. Ross Corbin.

South Dakota Geological and Natural History Survey, Circular No. 13—The Possibilities of Oil in Northern Ziebach County. By Roy A. Wilson and Freeman Ward.

Circular No. 11—Trees and Shrubs of South Dakota. By William H. Over.

Circular No. 12—Possibilities of Oil in Eastern Harding County. By W. C. Toepelman.

Circular 10—Possibilities of Oil in Northern Dewey County.

Division of Mines, Tennessee—Twenty-eighth Annual Report of the Mineral Resources of Tennessee.

Division of Geology, Tennessee, Bulletin No. 27—Administrative Report of the State Geologist, 1921-1922.

University of Texas, Bulletin No. 2234—Report on Texas Alkali Lakes. By C. C. Meigs, H. P. Bassett and G. B. Slaughter.

State College of Washington—The Clays of the State of Washington. Their Geology, Mineralogy and Technology. By Solon Shedd, Assistant State Geologist.

West Virginia Geological Survey—County Reports, 1923, and accompanying maps. Mine Inspector to the Governor of Alaska, Annual Report, 1922.

Department of the Interior of Canada—Natural Resources of the Prairie Provinces.

- Department of Colonization, Mines and Fisheries, Quebec, Canada—Report on Mining Operations in the Province of Quebec for the Year 1922.
- Department of Mines, Ontario, Bulletin No. 46—Hydro-Electric Development for Gold and Silver Mines of Northern Ontario. By A. R. Webster.
- Bulletin No. 48—The South Lorraine Silver Area. By Cyril W. Knight.
- Canada Department of Mines, Mines Branch—Summary Report of Investigations Made by the Mines Branch During the Calendar Year Ending December 31, 1921.
- Dominion Fuel Board, Canada, Interim Report, 1923.
- Department of Mines, Canada—Silica in Canada, Its Occurrence, Exploitation and Uses. Part I—Eastern Canada.

Current Magazines on File.

For the convenience of persons wishing to consult the technical magazines in the reading room, a list of those on file is appended:

American Petroleum Institute, New York.
Architect and Engineer, San Francisco.
Arizona Mining Journal, Phoenix, Arizona.
Asbestos, Philadelphia, Pennsylvania.
Brick and Clay Record, Chicago.
Cement, Mill and Quarry, Chicago, Illinois.
Chemical Engineering and Mining Review, London, England.
Engineering and Mining Journal-Press, New York.
Financial Insurance News, Los Angeles, California.
Graphite, Jersey City.
Journal of Electricity and Western Industry, San Francisco.
Metallurgical and Chemical Engineering, New York.
Mining and Engineering Record, Vancouver, B. C.
Mining and Oil Bulletin, Los Angeles.
Oil Age, Los Angeles.
Oil and Gas Journal, Tulsa, Oklahoma.
Oil News, Galesburg, Illinois.
Oildom, New York.
Oil, Paint and Drug Reporter, New York.
Oil Trade Journal, New York.
Oil Weekly, Houston, Texas.
Petroleum Age, New York.
Petroleum Record, Los Angeles.

Petroleum World, Los Angeles.
 Queensland Government Mining Journal, Brisbane, Australia.
 Rock Products, Chicago, Illinois.
 Safety News, Industrial Accident Commission, San Francisco.
 Salt Lake Mining Review, Salt Lake City, Utah.
 Southwest Builder and Contractor, Los Angeles.
 Standard Oil Bulletin, San Francisco.
 Stone, New York.
 The Record, Associated Oil Company, San Francisco.

Newspapers.

The following papers are received and kept on file in the library :

Amador Dispatch, Jackson, Cal.
 Arkansas Oil and Mineral News, Hot Springs National Park (Arkansas).
 Bakersfield Morning Echo, Bakersfield, Cal.
 Blythe Herald, Blythe, Cal.
 Bridgeport-Chronicle-Union, Bridgeport, Mono Co., Cal.
 California Oil World, Los Angeles, Cal.
 Colusa Daily Sun, Colusa, Cal.
 Daily Commercial News, San Francisco, Cal.
 Daily Midway Driller, Taft, Cal.
 Del Norte Triplicate, Crescent City, Cal.
 Gateway Gazette, Beaumont, Cal.
 Goldfield News, Goldfield, Nevada.
 Guerneville Times, Guerneville, Cal.
 Healdsburg Enterprise, Healdsburg, Cal.
 Humboldt Standard, Eureka, Cal.
 Inyo Independent, Independence, Cal.
 Inyo Register, Bishop, Cal.
 Kern County Progress, Shafter, Cal.
 Lake County Bee, Lakeport, Cal.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of buyers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them, have been made known to those looking for raw mineral products.

Since the publication of MINING IN CALIFORNIA was begun, current inquiries from buyers and sellers have been summarized and lists of mineral products or deposits 'wanted' or 'for sale' included in each issue.

It is important that inquiries of this nature reach the mining public as soon as possible and in order to avoid the delay incident to their quarterly publication in MINING IN CALIFORNIA, these lists are now issued monthly in the form of a mimeographed sheet under the title of 'Commercial Mineral Notes.' Those on the mailing list for MINING IN CALIFORNIA will receive the monthly 'Commercial Mineral Notes' as well.

EMPLOYMENT SERVICE.

Following the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau registers technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of current applications for positions and 'positions open' is carried in each issue. Notices are designated by a key number, and the name and address corresponding to any number will be supplied upon request, without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss. Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 11-9 Mining Engineer or Geologist. Education, School of Mines, Liege, Belgium, and Royal School of Mines, London. Three years' experience on European Geological Surveys. Speaks English, French, Greek, Bulgarian and Russian fluently, and some German. Salary open—moderate to start.
- 11-10 Any mining. Twenty years' experience as Chief Engineer, Mine Captain and Second Engineer, South Africa and West Africa fields. Age 40. Married. Salary, open.
- 11-11 Superintendent Mill or Mine. Technical education; sixteen years general experience as miner, assayer, foreman and superintendent of concentrating, amalgamating and cyaniding mills, etc.; also designing and erecting. Will go anywhere in western U. S. A. Age 48. Married. References. Salary wanted, \$225, minimum.
- 11-12 Development Service. For companies not requiring full time engineer. Underground surveys; mine mapping; preparing stope sheets and assay plans; mine records, tonnage reports; cost estimates; reports on properties, and other engineering service.
- 11-13 Superintendent. Five years' experience. Specialty, installation and operation of quicksilver ore reduction plants. Age 39. Married. References. Salary, open.
- 11-14 Superintendent, Placer Mine. Twenty years' experience. Can do surveying. Age 46. Married. References. Salary wanted, \$180 minimum.
- 11-15 Mining Engineer. Experience—various positions from miner to superintendent, since 1906. Age 41. Married. References. Salary wanted, \$300.
- 11-16 Executive or Assistant Manager. Graduate University of Copenhagen. Two years with Nogadi Soda Co., Ltd., Br. East Africa. Age 27. Single. References. Salary wanted, \$200.
- 11-17 Assayer. Eleven years' experience. Three years with last company. Age 45. Single. References. Salary, open.
- 11-18 Position in Pottery Industry. Eighteen years' experience as foreman and superintendent of plants, including much statistical, efficiency, production, selling and factory cost accounting. Age 39. Married. References. Moderate salary.
- 11-19 Working Mine Superintendent. Twenty-five years' general mining experience in Arizona, Colorado and California. First-class references.
- 11-20 Geologist. Two years' experience, laboratory and field. Age 25. Single. Salary wanted, start, \$130. References.
- 11-21 Operating Mine or Quarry. Seven years' experience in Mexico and the United States. Age 34. Married. Salary wanted, \$250 up. References.
- 11-22 Plane Table Man or Assistant to Oil Geologist. Technical graduate. Several years' experience in underground and surface surveying, field geology and paleontology. World War veteran. Salary, open.

PUBLICATIONS OF THE CALIFORNIA STATE MINING BUREAU.

During the past forty-three years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield, and Sacramento. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

REPORTS.

Asterisks (**) indicate the publication is out of print.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the state may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the state. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

THE STATE MINING BUREAU

CORDIALLY INVITES YOU TO VISIT
ITS VARIOUS DEPARTMENTS MAINTAINED
FOR THE PURPOSE OF FURTHERING
THE DEVELOPMENT OF THE

MINERAL RESOURCES OF CALIFORNIA

At the service of the public are the scientific reference library and reading room, the general information bureau, the laboratory for the free determination of mineral samples found in the state, and the largest museum of mineral specimens on the Pacific Coast. The time and attention of the State Mineralogist, as well as that of his technical staff, is also at your disposal.

Office hours: 9 a.m. to 5 p.m. daily.

Saturday, 9 a.m. to 12 m.

LLOYD L. ROOT,

State Mineralogist.

Third floor, Ferry Building, San Francisco, Cal.

Branch Offices: Pacific Finance Building, Los Angeles; Sacramento, Bakersfield, Taft, Coling, Santa Maria, and Santa Paula.

OUTLINE MAP OF CALIFORNIA

SCALE

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922, and continued until March, 1923.

Owing to a lack of funds for printing, quarterly publication was begun in September, 1923.

For the same reason, beginning with the January, 1924, issue, it has been necessary to charge a subscription price of \$1 per calendar year, payable in advance; single copies, 25 cents apiece. 'Mining in California' will continue to be sent without charge to our exchange list, including schools and public libraries, as are also other publications of the State Mining Bureau.

Pages are numbered consecutively throughout the year and an index to the complete reports is included annually in the closing number.

Such a publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff and other contributors are included. Mineral production reports formerly issued only as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance also are reported.

While current activities of all descriptions will be covered in these chapters, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added in the future as they are completed.

The chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful, latent resources of the State of California.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each district working out from field offices that were established in Redding, Auburn, San Francisco and Los Angeles, respectively.

This move brought the Bureau into closer personal contact with operators, and it has many advantages over former methods of conducting field work.

To continue this system most effectively with the limited funds available for the present biennium, the Redding and Auburn field offices were consolidated and moved to Sacramento on June 1, 1923.

The boundaries of each district were adjusted and the counties now included in each of the three divisions, and the locations of the branch offices, are shown on the accompanying outline map of the state. (Frontispiece.)

Reports of mining activities and development in each division, prepared by the district engineer, will continue to appear under the proper field division heading.

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the state's oil fields is included under this heading.

SACRAMENTO FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

NOTES ON MINING DURING THE YEAR 1923.

Although mint and smelter returns in 1923 show a falling off in actual production of gold in California from the 1922 figures, the past year has been a fairly good one for the gold mines. Production costs have remained high and the industry has suffered from a heavy labor turnover, but, in spite of these handicaps, development work has continued, new activities have been initiated and in the leading mining counties of the State and along the Mother Lode the outlook for increased activity and output in 1924 is most encouraging. The estimated production for 1923 is \$13,250,000. Among the principal producers are the dredges of Yuba Consolidated Goldfields and Natomas Company of California; Empire Mine at Grass Valley; Carson Hill Gold Mines, Inc., at Melones; Sixteen to One Mine, at Alleghany; Plymouth Consolidated Mine, at Plymouth; North Star Mines, at Grass Valley, and Kennedy Mine and Central Eureka, in Amador County.

Amador County.

Recent developments in the deep mines in this county as well as at Carson Hill in Calaveras County and at Grass Valley, make it appear that those geologists who have maintained that gold quartz mines invariably become leaner as the depth of working increases, will have to qualify their statement by citing an ever increasing number of California mines that are exceptions to their rule. The limit of some of

these deep mines may be determined by the costs of operation, and not by a diminution in the grade of ore. The bottom levels of such mines as the Argonaut and Kennedy are showing strong fissures and very flattering prospects and it has recently been said that these deep Mother Lode mines are apt to be as rich at the great depths attained as they ever were. Of course it does not follow that all the mines along this 'Lode' will be as rich, at great depth, as there are special geological conditions encountered in every property.

Argonaut Mine. During the first four months of the year the shaft and adjacent workings were repaired, after which repairs and replacements were made on the hoist and the shaft was concreted to a depth of 40 feet. The lower levels were unwatered and milling was resumed about the middle of the year, first with 20 stamps and about the middle of July with 40.

The mine is opened to an inclined depth of 4800 feet. Just previous to the last fire the south drift on this level was showing a width of 20 feet of quartz, and ore was being developed along the vein in new territory south of the region that had marked the limit of good ore in the levels above. Current reports are that this region is giving satisfactory results.

Bunker Hill Mine came under the control of the owners of the adjacent Original Amador Mine this year and it was hoped that the two mines would be worked as a unit, using the Bunker Hill shaft to explore the lower part of the Original Amador, but nothing came of it.

Central Eureka Mine continued mining and milling throughout the year, but not on as high a grade of ore as the previous year. The workings reached an inclined depth of 4100 feet early in the year. Many improvements such as a new headframe, new rails in the shaft and shaft repairs have been made.

Fremont Mine. The mill at the Fremont Mine was put in operation the middle of March after Metals Exploration Co. had spent a long time in repair work and prospecting. The mine and mill have since been in steady operation. About the middle of August, Metals Exploration Co. gave up the property and a new company, known as Fremont-Gover Mines Company, was organized. The directors of the new concern are Edwin Higgins, Roy Elliott, William Colby, S. A. Holman, and E. E. Check.

Due to the fact that considerable ore had been previously developed in the mine, the recent operations have shown a low cost. The mill was handling about six tons per stamp per day in August with 35 stamps in operation on ore of ordinary Mother Lode grade. The company is at present selling stock and the mill is operating.

Kennedy Mining and Milling Company has sunk its shaft from the 4050 to 4200 ft. level (vertical) and has crosscut on the 4200 level recently, with the work still going on as this is written. A width of 20 feet where the crosscut went through the footwall vein has been reported to assay so well that the owners are greatly elated, more particularly since this came close on the heels of the last stock assessment. After passing through the footwall vein the crosscut was being continued through the horse toward the East Vein and had reached a

length of 70 feet when this was written. It was said this entire distance assayed well, but this has not been substantiated.

The Kennedy has suffered a number of interruptions to operation during the past year, and production has been much below normal.

Marklee Mining Company. Jos. L. Del Monte, president, Federal Bldg., Oakland, Cal. Organized to work the Marklee and Alturas Mines, five miles north of Volcano. According to early U. S. government reports the Marklee Mine began production in 1869 and for several years yielded good ore. A boiler, hoist and new headframe have been installed and the old shaft had been partly cleaned out and retimbered late in the fall, with work continuing.

Moore Mining Company has sunk the shaft at the Moore Mine 100 feet and has opened a new level at 640 feet, where the ore body was encountered on the south after about 70 feet of drifting. The difficulty of sinking and keeping the mill running with a single drum hoist was to be overcome by conversion to a double drum hoist, according to plans announced. Milling with 20 stamps was resumed the middle of July. The first clean-up thereafter showed an average yield of \$6.82 per ton.

Old Eureka Mine was sold under foreclosure in July to Walter Harper of New York. This sale is the aftermath of the recent extensive operations about 1920, and the hope has been expressed that with the clearing up of the ownership there might be some action toward reopening.

Oleta Gold Mining and Milling Company has been doing some development work on the L. Smith property near Oleta and has lately been sinking a shaft.

Original Amador Mine was held in readiness for operation until late in the summer, when it was said plans for work had been given up.

Plymouth Consolidated Gold Mines have remained in steady operation during the year and have been one of the principal producers of the county. The operations reached a depth of about 4000 feet and a level was opened at 3850 feet early in the year. The deeper operations have been through a winze, but it has been planned to deepen the shaft if the prospects justify. William J. Loring, general manager. Stanley Arnot, superintendent.

PLACER MINES.

American Flats Gold Mining Company announced they would begin operation at Oleta in July.

Elephant Deep Hydraulic Mine was in operation as long as water lasted the past spring and it was stated that the cleanup amounted to \$15,000. Preparations were under way in the fall for a resumption of work. The mine is in the Volcano district and has been worked under lease by Barone Bros. of that place.

Ludekins Hydraulic Mine in the Volcano district was also operated the past season.

Calaveras County.

COBALT.

During the past two years several samples of cobalt diarsenide (smaltite) with erythrite, have been brought to the attention of the Bureau. These apparently came from a single small prospect, which was visited in November, 1923. It is in the northwest quarter of Sec. 21, T. 4 N.; R. 14 E.; about a mile by trail from the Murphy-Sheep Ranch road and on top of a ridge at an elevation of over 3000 feet.

A surface cut 15 feet long and 3 feet deep had been made on a stringer of the ore. This had been only a few inches wide between a mica schist footwall and quartzite hanging wall, and had pinched out, so far as could be seen, both on the dip and strike. Only a few hundred pounds of ore had been found, but samples indicated it was of good grade. The claim was idle and the ownership uncertain. It was stated that some work was planned by R. C. Johnson.

COPPER.

Extensive improvements and additions, including enlarged power supply, have been under way at the properties of the *Calaveras Copper Company* at Copperopolis during the summer and fall. Actual production was started late in December.

GOLD QUARTZ MINES.

Apex Mining Company, 78 Bacon Building, San Francisco, Henry Hyde, president. This is a new stock company based upon the *Ford Mine*, one-half mile from San Andreas. The mine was formerly opened to a depth of 700 feet. The present company unwatered the workings to the second level, after cleaning out 60 feet of caved shaft. They report new work underground consisting of 182 feet west and 190 feet east on the 100 level. On this level on the west they found a vein on which they drifted 60 feet and crosscut 44 feet in vein matter. A portion 12 feet wide in the center of this is said to assay well. Some of the quartz seen in place by the writer shows free gold. This vein is a stringer lead in black and greenish schist, with tale on the walls. It strikes about N. 18° W. and in one part of the west workings dips west on account of local faulting, the normal dip being east about 62°. The fault gouge, where one portion of vein was thrust over the other, can be seen. The hanging wall part of the mine as explored in the east crosscut, shows a vein six feet wide, well mineralized with pyrite, 100 feet east of the shaft. It dips east about 50 degrees and is very tight with no gouge. In the next 100 feet, this crosscut shows several tale gouges, and an intrusive rock now changed partly to tale cuts off stringers coming in from the northwest.

The new company claims to have spent \$18,000 to October 1, 1923. They have built 2½ miles of electric line and have installed motors for the hoist, pump and compressor. Four men were employed when visited November 9.

Bullion Hill Mining Co. (Bibl. Preliminary Report 8, Jan. 1922.) This company suspended work about the middle of the year at the Washington Mine, six miles north of Murphy. Time and money that should have been spent in the development of a promising property

were wasted in litigation between members of the company, and work stopped, according to local report, when ore above the adit level had been removed. The owner has taken steps to recover the property.

Golden Eagle Development Co. R. C. Johnson, 453 Frederick Street, San Francisco, has a lease and option to purchase Golden Eagle Claim from the owners, and has located three other claims adjoining, and has formed a stock company to work them. Claims are a mile east of Sheep Ranch, in the southwest quarter of Sec. 9, T. 4 N.; R. 14 E. Equipment includes a small steam engine and hoist, headframe, and shed.

An old shaft 70 feet deep near the center of Golden Eagle claim had been cleaned out and deepened 30 feet up to November 3. The vein shows a wide outcrop near the shaft but can not be traced far on the strike. It strikes northeast. At 100 feet depth the shaft shows a decomposed dike about 20 inches wide with five inches of bluish quartz on the hanging wall and 3 or 4 inches of quartz on the footwall. It is possible the shaft is in the hanging wall of the main vein and that a crosscut will be needed to reach the vein.

Jolly Tar Mining Company. Based on a lease and option to buy a patented quartz claim of the same name in Sec. 28, T. 3 N.; R. 13 E.; one-half mile from Altaville on the Esmeralda road.

When visited November 9 the property was idle and deserted and the shaft more than half full of water. One of the owners stated the shaft had been sunk about 325 feet and that during recent work a sudden flow of water had been opened, forcing the men out until a larger pump can be installed. The dump shows that all the work has been done in blocky amphibolite schist with meager seams of calcite and quartz. Crosscutting to the east is planned.

Morgan and Melones Mines. These mines are now operated as a unit by Carson Hill Gold Mines, Inc., William J. Loring, general manager. The group also includes *Calaveras Consolidated Mine*. The combined properties with their central milling plant, which has a monthly capacity of over 15,000 tons, are the only producing mines on the Mother Lode in the county at this time, and rank among the five largest gold quartz mines in the state as regards both gold output and tonnage handled.

The story of the rejuvenation of the Morgan Mine by Loring after an idleness of 20 years, and the purchase and successful operation of the Melones Mine by him in conjunction with the Morgan after the Melones Mining Company had closed their mine down on account of high costs, is an instructive illustration of the possibilities of deep mining on the Mother Lode.

Ore is being milled from the flat veins of the Morgan Mine and from the deep workings of the Melones Mine. The Melones workings have reached an inclined depth of 4268 feet, measured from the apex on New Year Claim. The lower levels of Melones Mine are reached by a crosscut and new 3 compartment shaft. The later developments in this mine showed again that good ore recurs in depth on this lode if finances permit sinking and exploration at sufficient depth.

The annual production for 1923 is expected to be about as in the past.

DRIFT MINING.

Considerable work is being done on the Central Hill-Vallecito channel system between Parrot's Ferry and Dogtown. These gravel deposits have never been developed extensively because the ancient channels here are below the present drainage, making it necessary to work the ground with shafts and pump the water. The channel course had never been definitely determined this entire distance and it appears that former ideas as to its exact course near Vallecito have lately been proven erroneous. The whole history of the geologic periods when the ancient gravels were deposited, was also much more complex than has been appreciated. The limestone bedrock has proven to be a factor of uncertainty due to the great susceptibility of the limestone to solution and the consequent tendency toward the formation of underground channels, caverns and mud seams.

Balaklava Mining Company. 912 Santa Fe Bldg., San Francisco. Fred Niebling, president; Lee Wilson, secretary. Based on the property including the Osborn and I.X.L. mines near the Vallecito-Columbia road about two miles from Vallecito and between the old Moffat workings on the southwest and Lombard and Sloane workings on the northeast.

There is an inclined shaft on the west half of the property. This shaft is about 400 feet deep on 27° incline, or 185 feet vertical, with a station at 375 feet. From here an old drift, now partly caved, is said to run about 100 feet southwest. Geo. Condon, superintendent, states that a winze sunk from a short crosscut off this drift showed gravel, but no further work was done to explore this gravel so it is not known if it is in place in a channel. The superintendent said it was their intention to run a drift north and east from the 375 ft. station in a search for the north rim. The gravel channel is said to have not been bottomed in these workings, and its depth, width and exact direction are uncertain and it would appear that estimates of probable tonnage of gravel and tenor of same are guesswork.

Equipment consists of gasoline engine, skip for bailing water and blacksmith shop. Seven men were employed early in November, 1923.

Bishop Estate. A. H. McKenzie, L. L. Richard, R. D. Skelley and Don Steffa are associated in prospecting this property to get information on the ancient channel preparatory to mining. They have a lease on 285 acres, and if the prospects warrant may organize under the name of Vallecito Western. At present they are prospecting with a Keystone drill on Six-Mile Creek just above the Angels Camp-Vallecito road crossing, and west of the supposed confluence of the Vallecito and Central Hill channels. Up to the first of November, 1923, they had drilled four holes, of which the first was on the north rim, and the second is said to have passed through 52 feet of rhyolite ash and cobbles and four runs of gravel. The other holes were on the south rim.

Should the results warrant them in opening the ground, they plan to work through two shafts, one near Six-Mile Creek and the other a mile west. There is thought to be about two and a half miles of old channel in the property.

The same partners worked from January, 1920, to June, 1923, at the north end of Vallecito in a search for the Central Hill Channel,

which had been thought to pass that way. Working through a shaft 192 feet deep, they report they did a total of 5300 feet of underground work. This included a drift 1150 feet long northeast on what Steffa terms a fault; also a drift 350 feet south, both from near the bottom of the shaft. They also drove both ways from a depth of 106 feet. A winze was sunk 110 feet below the bottom of the shaft and they report the fissure is about 18 feet wide at that depth. At the 192 ft. level the fissure was about 72 feet wide, but they were there about 100 feet below where the channel might be expected. There is said to be some pay on this latter level for a length of 600 feet, but no bottom. It appeared as if the gravel had been swept or dragged into the open fissure before the lava ash covered the surface. The bedrock here was limestone, and the experience in this case showed the uncertainty of mining an old channel on this formation.

Hesperides Mining Company. H. B. Patterson, president and general manager. This company is working a combined gold mine and gravel pit on the Crocker Estate property adjoining Wallace, on the Lodi-Valley Springs railroad branch. The equipment includes digging, elevating, crushing and screening machinery, besides gold saving equipment. The management reports that the gravel contains a few cents in gold per ton. Several sizes of gravel and crushed rock and pea gravel and sand are produced and a capacity of 600 to 800 tons a day is claimed, with a fair profit on the rock products besides the gold.

Jackrabbit Mine and *Purington Golden Treasure Mine* are north of the Victor Mine on Central Hill Channel. Geo. Werley of Angels Camp and F. R. Purington have been doing some work on these properties, but have not reported any production up to November, 1923. Werley stated they had struck gravel in the Jackrabbit near the old Monarch line and had also run about 70 feet downstream in the Golden Treasure but not in pay. The combined properties cover about $2\frac{1}{2}$ miles along the supposed course of the channel. The old workings of the Jackrabbit Mine included a shaft 191 feet deep and drifts totaling 1700 feet or more, the work having been done about 25 years ago. Equipment includes a Cornish pump, centrifugal pump and 3-stamp mill. The gravel is cemented.

Slab Ranch Mine is between the Victor Mine and Bishop Estate. Wm. Graflin had begun work here in November, 1923. A hoist had been put up and a shaft had been started to prospect the Central Hill Channel. This shaft was down about 45 feet at that time.

Vallecito Consolidated. This mine is on the Bishop Estate property, which see. The original lessees who are now drilling near Six Mile Creek carried on extensive work through this shaft, as described above. The fissure carried pay gravel in small quantity for a length of 600 feet, but the operators did not consider it a large enough showing for the scale of operations they planned, so they subleased this ground to Chas. Sanguinetti and associates of Vallecito, who are continuing work and express satisfaction at the results obtained and the gravel in sight.

Victor Placer Mine has been described in the monthly chapter for January, 1923. The mine has continued operation steadily throughout the year and has been making a small production of gold. The gravel is cemented and has to be milled.

El Dorado County.

There has been little activity in the gold mines of the county during 1923.

Crown Point Mine near Diamond Springs was unwatered during the year but it is said nothing was done in the way of mining.

Grit Mine was abandoned by the Grit Gold Mining Company, who have transferred their operations to the *Vandalia Mine*, which they are rehabilitating at this time.

Gold Standard Mining Company, which had been prospecting just north of the old Zantgraf Mine on a vein parallel to the Zantgraf vein, quit work after sinking a shaft over 125 feet.

There was some activity and a small production from the Slate Mountain district, but in general only small prospecting was carried on.

Just below Georgia Slide on Canyon Creek an effort was made by Wm. Kelliher and Henneuse Bros. to operate a drag line scraper in the gravel and debris that had accumulated in the creek as a result principally of the old operations at the Georgia Slide mines. This equipment was found not adapted to the work and a gravel pump was later put in, but so far there has not been any production.

STRUCTURAL AND INDUSTRIAL MINERALS.

Limestone has become in late years the principal mineral product of the county. *The Mountain Quarries* of Pacific Portland Cement Co. have been producing annually several hundred thousand tons of limestone for use in making cement. *El Dorado Lime and Minerals Company* quarry on the railroad below Shingle Springs and *Newcastle Lime Company's* quarry near Rattlesnake bridge have produced ground limestone and burnt lime for various uses, the latter quarry having been in operation the present year. Besides the kilns it is equipped with a mill to grind limestone for use as a soil corrective and 'sweetener.'

El Dorado Slate Products Company is a recently formed stock company based upon the *Chadbourne Slate* property on the steep south side of Big Canyon, a mile and a half from Placerville station. The property contains 32 acres, mostly patented and is well situated for opening by a series of benches at different levels along the canyon side. The slate will have to be hoisted to the top of the hill, a maximum vertical distance of about 400 feet. Due to its nearness to the railroad, this quarry would have an advantage in hauling costs, as the other quarries are all considerably farther from transportation.

Two or more abortive attempts have been made to open the quarry and bring it to production, but the work done and the output have been trifling. Two openings were started, one 175 feet below the brow of the hill and the other near creek level. The slate opened appears to be of good grade, free from pyrite so far as could be seen in the limited workings and of quality similar to that from other nearby quarries. In the upper pit there is a width of 22 feet without quartz seams which do, however, appear on the hill farther south along the strike.

Stock in the project is being sold but to date there has been no work done at the quarry by the present company. John F. Armstrong of Sacramento is president of the company.

For some years past the principal production of soapstone from the northern part of the state has come from the western part of this county near Shingle Springs and Brandon.

Nevada County.

Due to the lower price now paid for silver and the failure of Nevada to bring in any rich new gold mines, many of the Nevada companies have moved their activities to the Grass Valley district and in the past few months that city has taken on some of the aspects of a boom camp. There have been numerous investigations made and options taken and in several cases work has begun. The movement began too late in the year to permit the recording of actual results at this time, but it is probable that Grass Valley is due to take a prominent place in eastern stock exchange transactions next year and some interesting results may be looked for if promised underground work is carried out.

It has been the conviction of those best acquainted with our California mining districts that our mines need more active and aggressive prospecting companies, and that if new capital could be devoted to deeper exploration of undeveloped territory, the mines would be found not wanting. In this regard the new companies will be doing a real service to the mining industry of the state if they can develop even a few new mines of merit from among the many prospects that have been lying idle around the Grass Valley district.

As most of the mines and prospects of the district have been described in a recently published report of this Bureau, only a summary will be given here to indicate the lively condition of the region.

The mill at the *Alcalde Mine*, four miles southwest of Grass Valley, was put in operation July 23 last following a very flattering little discovery of high grade ore. It has been in nearly steady operation since and some very satisfactory cleanups have been reported. George W. Root and Lloyd L. Root are directing operations.

Alta Hill. (See Grass Valley Gold Mines.)

Ancho Mine, in the Graniteville district, reported taken under option in July.

Arctic Mining Company with claims on Canyon Creek in the Washington district, has been crosseutting during the past summer.

Banner Consolidated Mines including the *Central Consolidated* and the *Norambagua*, have had some preliminary work done during the past summer.

Ben Hur Divide Mining Company of Tonopah, Nevada, took an option in September to purchase the *Ben Franklin* group 2½ miles south-east of Grass Valley. Two known veins have been worked, the Alaska dipping east and the Ben Franklin west. The deepest working was on the Alaska claim which has an inclined shaft about 500 feet deep. The last previous work was in 1916. Work was begun promptly by the present lessees, cleaning out the old workings on the Ben Franklin.

Brunswick Mine was unwatered by the owners during the summer and development has been under way for several months. At the end of November the management announced that they had found what

they thought to be the Mill vein in the 1100 level crosscut and would start another crosscut from the 1300 level.

Eagle Bird Mine in the Washington district was in operation and ore was milled during the year.

Empire Mine has continued mining and milling at the usual rate during the year and will be the principal producer of the county.

The Grass Valley district has been employing about 1000 men, of whom about 400 were working at the Empire, and a nearly equal number at the North Star, and the rest at smaller properties. The quartz mines around Nevada City were idle till late in the year, when work began on the *Mayflower Group*.

Gold Wedge Divide Mining Company of Tonopah, Nevada, has taken a lease and option on the *Randolph Consolidated* property on the Wm. Grant Ranch, near Rough and Ready.

Golden Center Mine at Grass Valley has been leased with option to purchase, to M. K. Harr of Philadelphia, who is locally connected with the Grass Valley Gold Mines. It is stated that water is being removed from the shaft at this time with the idea of beginning work on the 500 level as soon as possible. The owners claim they left a good prospect on this level. This mine is equipped with a 20-stamp mill and considerable machinery. The price agreed upon will give the stockholders of the old company a handsome profit if the deal is completed.

Grass Valley Gold Mines, under the direction of M. K. Harr, president, and F. Sommers Schmidt, engineer, has been sinking a shaft on Alta Hill, near the old Hope shaft. This work had reached a depth of about 415 feet with crosscuts run several hundred feet at a depth of about 275 feet, when operations were halted late in December by lawsuits brought by the various property owners whose land had been held under option by the operating company. No important strike had been announced by this company up to the time work stopped, though it was said some quartz stringers had been crossed in the crosscutting.

Gould Mound Mine in the Rough and Ready section $2\frac{1}{2}$ miles west of Grass Valley and containing about 100 acres, was reported taken under lease and option in May.

Hilltop-Nevada Mining Company. See Grass Valley Gold Mines.

Idaho-Maryland Mines continue under development by Metals Exploration Co. of New York. Early in the year a shaft section of about 1000 feet was completed to give more direct connection with the lower levels and reduce cost of operations. The mill has been used at times for sampling.

Normandie Mining Company has continued prospecting their property near the Alcalde Mine and have reported an encouraging showing found while crosscutting.

North Star Mines curtailed milling operations early in the year on account of a decrease in ore reserves caused by a lagging in development work in recent years and failure of some of the ground to come up to expectations. They began prospecting below the 6300 level through a winze.

Osceola Mining Company has been drifting on the vein in their property near Rough and Ready and have reported good prospects.

Republic Mine in the Graniteville district was operated this year and some ore was being crushed during the summer.

Twin Sisters Mining Company, J. W. Howard, General Manager, 420 Forum Building, Sacramento. Organized in Nevada to work the Twin Sisters Group of three claims and three claims on the Independence vein in sections 12 and 13, T. 18 N.; R. 10 E.; just south of Middle Yuba River and at the south end of the Alleghany district. The claims are 24 miles from Nevada City via Snow Point.

Five men have been employed during the fall of 1923. Two adits were run on the Twin Sisters vein by former operators. No. 1 adit strikes the vein 155 feet from the portal and continues on it 280 feet southward. No. 2 adit is 120 feet below No. 1 and was reported 946 feet long when new work began. For the first 300 feet it is in disturbed ground near the surface, then on the fissure for 385 feet, passing into footwall for 100 feet, and the balance of distance on the vein. The property has not been visited by the writer, and the above details are from a report by E. C. Uren, who states that the vein averages 18 inches to 50 inches wide for the last 160 feet. Since new work started some arsenopyrite ore has been found and good prospects have been reported.

The Eureka ditch crosses the Gold Beater claim 370 feet above No. 2 adit and offers a source of cheap power, 1600 feet of pipe being needed.

PLACER MINES.

The tunnel of the *Gold Lead Placer Mine* had reached a length of 1950 feet and 12 raises had been put up by the middle of the year. Oscar L. Coffin, manager.

Malakoff Leasing Company is engaged at North Bloomfield in exploring the deep channel in part of the old Malakoff diggings. When it was found that the shaft was not yet deep enough to bottom the channel, it was decided to sink 75 feet further, giving a total inclined depth of about 350 feet. An air compressor was taken in this fall to expedite work. W. S. Weaver is manager.

Penn-California Mining Company. Their mining claims are in the Willow Valley district and have been described in our past reports.

Their main adit was driven 2700 feet to a point 600 feet vertically below the center of the ridge then 1500 feet eastward. Raises were put up at 1100 feet (air shaft) 1500, 1800 and 2300 feet from the portal and Hoge reports that 1000 feet of drifts were run from these raises to explore for gravel. Gravel was found, but although a few hundred dollars worth of gold was washed out in the course of prospecting, the manager reports that as a whole the gravel was not of such grade nor of sufficient quantity to justify breasting. It was not confined to a definite channel, but appeared spread out and thin. The last 1500 feet of adit was in slate bedrock, the rest in granodiorite. The adit was in large part double track size.

Recent work has been directed to finding the Buckeye vein which Hoge said he expected to encounter during November or December this

year. He hoped this ledge would reveal ore that would partly pay for carrying on development. The claims are equipped with a 15-stamp mill and sawmill and nine men were employed this fall. Arthur W. Hoge, manager.

Time has not permitted visiting the placer mines of the county this year.

Liberty Hill Hydraulic Mine was in operation a short time early in the year and a small cleanup was made.

Sidney Wood has been preparing for hydraulic mining at You Bet.

COPPER.

Western Copper Company is a consolidation of numerous old mines in the Spenceville district. Eugene Aram of Sacramento and Otto Woehler of Spenceville are forming the company and are part owners of the holdings. The Golden Eagle, Index and Legion claims (formerly the *Mineral Hill M. & S. Co.*) Arkansas Traveler, Last Chance, Jackson, 16 to 1, San Francisco, Philadelphia and American claims, all patented, and 10 unpatented claims adjoining, are included. The claims are 2 to 3 miles north of Spenceville and 14 miles by road northeast of Wheatland. Many of the claims have been noticed in our last county report, and space does not permit a detailed listing of all the shafts and tunnels driven in the past.

Last Chance shaft is 240 feet deep with only a few feet of drifting at different levels. Mineral Hill adit on Index claim is a crosscut 498 feet long, and is said to cut five veins. In Golden Eagle claim a vein is exposed showing carbonate ore in shallow shafts. The dump of the old Bitner shaft, sunk in the sixties and reported to be 160 feet deep, on this claim, shows pyrite ore, which was evidently too low grade to ship at the time. The Jackson claim has been prospected by the California Tunnel, 950 feet long, which is in the wall rock two-thirds of the distance, then enters the vein through a crosscut, near which a raise was put up 60 feet and a winze sunk 40 feet. From here to the face stopes were put up 10 to 25 feet and according to report considerable good ore was taken out.

Recently work has been resumed cleaning out this last named tunnel, and Woehler reports some good assays. Samples shown as having come out in this work carry chalcopyrite, pyrite, galena, other sulphides and malachite.

BARITE.

Democrat Barite Mine near the Liberty Hill hydraulic mine has produced several thousand tons of off-color barite during the past summer for use in making lithopone. The ore has to be treated by a special process to render it sufficiently white for this use.

F. W. Bradley's Barite property north of the old Spanish Mine and six miles from Washington, was undergoing development during the summer. High cost of delivery of ore to the railroad, on account of the distance, has held back the exploitation of this property.

Placer County.

Mining has been rather dormant in this county also the past year.

American Bar Quartz Mine has been under development during the year and a flume has been built to bring in water to furnish power for the mill. The mine was described in Report XVIII of the State Mineralogist, 1922, June chapter.

Canada Hill Mines have been prospected under the direction of Fred Vahrenkamp. The property was described in Report XVII of the State Mineralogist, 1920.

Daniel Webster Mine near Michigan Bluff has been active.

DRIFT MINES.

Baltimore Mine adjoining Forest Hill, has been rather extensively prospected by the owners, George McAulay and J. Steiner of Auburn, during the past two years, the work being done on contract by local miners who at the same time are mining gravel in other parts of the mine. The primary channel in this property was cut off by the later and deeper Blue Lead channel, which here was a wide stream with apparently gently sloping rims. The recent work has been done with the idea of picking up the other segment of the primary channel, and to do this they have run across the course of the Blue Lead, beneath the gravel, and have raised when they thought they were far enough on the other side to be beyond the later trough. The Blue Lead was found wider than expected, and the primary or Forest Hill channel has not yet been picked up.

Glen Mine has been in operation on a small scale. On the basis of royalty paid, the property is reported to have produced \$44,000 during 1922, but the yield for the current year has not been reported yet. As far as known, it has been the only productive drift mine in the county for some time, if we except a few prospectors' lone operations. The mine is described in our Preliminary Report 8.

Gold Dollar Mining Company continues prospecting the Blue Eyes claims near Duncan Canyon and beyond the Glen Mine, south of the Last Chance road. They also began this year the prospecting of the *Jack Robinson* drift claim, adjoining the Blue Eyes.

Gold Dollar or Blue Eyes adit has reached a length of 2200 feet. An air and exit shaft part way in is used also for ventilating with a blower. Near the face of the main adit crosscuts were run 150 feet each way and a raise was put up 20 feet from the top of which they ran 110 feet ahead. An electric lighting plant has been installed.

At the Jack Robinson claim a heavy run of secondary gravel, which was revealed by former work but never bottomed, is being prospected. This adit is now (Dec. 15) 280 feet long and Moss reports the floor is running into bedrock. Work at both properties is under the superintendence of F. A. Moss, who is convinced that there is a primary channel in the Blue Eyes that has been cut by the later Jack Robinson channel, and that this primary channel fed the fabulously rich early day diggings of Duncan Canyon and its tributaries, one of which was

worked up to near the site of the present Blue Eyes adit. The Blue Eyes claims cover some 2800 acres along a lava covered ridge which is two miles wide in places and the work by Moss is the first sustained effort to explore its possibilities, although many small 'breakouts' of gravel have been worked along the ridge. Moss reports that his company has made the first payment on the Blue Eyes property. This ridge, as well as the opposite ridge on the other side of Duncan Canyon contains large gravel deposits that have hardly been scratched. Some of these appear from such work as has been done, to be small and rich as in the case of the Glen; others are large and lower grade, but if intelligently worked may exhibit pay streaks that will be worth following.

The *Guggenheim dredge* operating in American River southeast of Applegate has been the principal gold producer of the county the past year.

Plumas County.

This county remains in the lead in the state as a copper producer. As a by-product of the copper mining operations there is also an important production of silver, running from \$150,000 to \$175,000 a year of late. The copper mines also contribute a large part of the gold produced in the county at present.

Engels Copper Mining Company operating Engels and Superior mines, is the largest metal mining company in the state in point of tonnage of ore handled and gross value of the products. The production of copper by this company has reached as much as a million and a quarter pounds per month during the current year. For the six months ending July first the company produced, according to their report, 7,398,106 lb. of copper, 82,852 ounces of silver and 1318 ounces of gold. On this basis if production does not diminish the year's output will be close to two and a half million dollars in gross value, making allowance for a slight decrease on account of the decreased price of silver. The mill handles about 1000 tons of ore daily, and a total crew of about 500 men is employed. They stated that their operating cost was about 11.45 cents per pound of copper for the first half of the year.

Feather River Copper Company's claims near the Engels Company's Superior Mine were bought this year by Engels Copper Mining Company.

Beardsley Copper Mining Company had completed a mill and were reported to be running an electric power line from the main line in Indian Valley to their claims near Taylor Lake, a distance of about 8 miles, during the past summer.

Walker Copper Mine, operated through a subsidiary by *Anaconda Copper Mining Company*, enlarged their flotation plant during the summer and it was expected that the new units would be ready for work in October. During most of the year they operated at a capacity of 250 tons a day.

Shasta County.

On account of the closing of the former office of the State Mining Bureau in Redding and the consolidation of the work with that of the former Auburn office at a new office in Sacramento, there has been an increased amount of work to be done both in the office and in the field and there has not been as much opportunity for field work in the northern end of the state since June as was desired. It may be said, however, that gold mining has been very quiet in that section, with little gold production for the year except from the dredgers and placer mines, most of the work recently begun at the quartz mines having been in the nature of prospecting, as will be seen from a short notice of the operations that have come to our attention.

The *American Mine* in French Gulch district was being prospected during the summer and fall and good ore was reported late in the year.

At the *Bonanza Gold Dollar Mine* just north of the town of Shasta, a 5-stamp mill was put up in the fall to crush an accumulation of a few hundred tons of ore.

Ganim Gold Mines Company was incorporated in August to continue operation of claims near Stella, and a small mill was reported to have been put up, but the mine was idle in October. The property is described in our 1922 report, December chapter.

Niagara Mine in French Gulch district was being prospected during the summer by H. M. Thompson.

Preparations were being made to unwater the *Reid Mine* in July, in anticipation of the reopening of the Kennett copper smelter. This mine was in operation 15 years previous to the closing of the above smelter and the quartz ore was used as flux at the smelter.

Uncle Sam Mine was being prospected during the summer by the *Colma Copper Company*. An unusual accident occurred at this mine in June, when lightning struck and destroyed the compressor building and a part of the machinery.

After eight years operation along Cottonwood Creek in the Gas Point district, *Shasta Gold Dredging Company* was cleaning up the last of its proven ground in that region in September, and it was doubtful if work would continue much longer.

COPPER.

Interest in mining in this county the past year has been centered upon the operations of the large copper mining companies and the possibilities of their resuming work. With an increase early in the year in the price of copper, and the anticipation that this increase would hold, work was started to put several of the mines in shape for ore production and two of the larger companies put crews of men at work getting the smelters ready. However, the price of copper dropped again about the time the mines and furnaces were ready for production, with the result that conditions were very uncertain toward the end of the year. In spite of the fact that the sales of copper during the past

month (November) and for several months this year, as indicated by the records of deliveries from refineries, have been record breaking, the price of copper delivered remained about thirteen and one-eighth cents a pound the middle of December. This is a price at which most California copper mines find little inducement to operate unless their ores carry sufficient gold and silver to help out.

Afterthought Copper Company's properties were sold under foreclosure late in the year to Forest P. Tralles of St. Louis, assignee of the executors of the will of J. F. Milliken of St. Louis, who, it is said, had loaned the company over a million dollars. A compromise between the Milliken interests and the bondholders is reported to have been arranged whereby the bondholders will receive a few cents on the dollar, leaving the stockholders out.

Mountain Copper Company's smelter at Martinez was fired July 26 after an idleness of four years and the first copper was turned out August 15. In September 125 men were employed at the *Iron Mountain Mine* and the oil flotation plant at Minnesota had also been put in operation. However, in November the Iron Mountain Mine had been shut down and the future operations were uncertain.

All the holdings of the *Trinity Copper Company* in Shasta County were attached in August by the Federal National Bank of Boston. The best known of the claims of this company is the *Shasta King*, nearby the Balaklala, and seven miles west of Kennett. The property had been idle a number of years.

United States Smelting, Refining and Mining Company put a crew of over a hundred men at work at the *Mammoth smelter* in August to prepare for reopening the smelter. At the same time, 65 men were put at work at the *Mammoth Mine* and about half as many at the *Key-stone* and *Balaklala Mines*. Late in November one furnace was reported in operation, but there have been no opportunities for field trips to the district the past month, so it is not known whether work will be continued or not.

BARITE.

Loftus Barite Mine was being prospected the past summer by H. C. Austin who is planning to buy the property. It lies about 2 miles in an air line east of Castle Rock. Austin has been considering the installation of a tramway, as the claims lie in rough country. The surface extent of the barite outcrops is said to be very large and a depth of about 50 feet has been reached in prospecting. The color of the rock varies from white to gray.

COAL.

An adit was being driven in October on a coal prospect on the *Lon Luce property* in section 20, T. 33 N., R. 1 W.; a little over a mile from Oak Run postoffice. A. Stevens of Oak Run was in charge.

At the time of visit the adit had been driven 43 feet and showed at the face a width of five feet of coal, of which several layers appeared more lustrous and harder than the rest, but nearly the entire width was coal, the seams of clay being narrow. The quality of the material had improved rapidly after leaving the surface. It is jet black in color

and looks like a better fuel than the ordinary run of California lignite, approaching sub-bituminous and not checking and slacking as fast as the brown lignite, though it soon shows the effect of exposure to the air. The coal bed dips east and north about seven degrees, has a sandstone and shale roof and a shale floor. The tunnel was being run a little south of east, and water was beginning to show a little at the face. On account of the direction the work was taking, it was becoming a flat incline in which it would no doubt be necessary to soon arrange for handling the water. There was no time to make an examination of the enclosing strata for fossils that might show the age of the coal, but although there is some uncertainty, the coal may be Cretaceous.

Surface outcrops of coal have been noted in a belt some ten miles long, according to local people, but for the most part these outcrops have not been prospected, although the U. S. Geological Survey comments on some coal prospects in the Ingot region, in the Ione formation. The region appears worthy of closer investigation on account of this coal and it is hoped that there will be an opportunity for field work there by the Bureau next spring.

The greatest handicap to development of the prospects is the long haul to the railroad, the nearest railroad point now being Palo Cedro, 17 miles away. It would be necessary to develop a good sized field of merchantable coal to justify a railroad, unless some lumber company should decide to exploit timber lands in that section.

Sierra County.

The Alleghany district, and particularly the Sixteen to One Mine, has produced most of the gold mined in this county during the past year. Due to the fact that some of the other large producers of the state will show a decrease in yield this year from various accidental causes, it seems probable that the Sixteen to One Mine will rank among the three largest gold quartz producers for 1923. This record is all the more notable because it is being made with a normal working crew of 30 to 40 men. Relatively small production has also been made by the Plumbago, Tightner, Rainbow, Kate Hardy and Irelan Mines during the year, so far as reports late in the year indicate, but these figures are apt to be changed at any time by discoveries of rich bunches.

All the mines and prospects that were accessible at the time were described in the October chapter of our 1922 report. Some changes since are noted below.

Work at the *Brush Creek Mine* was suspended after two explosions of gas had resulted from workmen penetrating the old workings.

A mill has been put up at the *Contact Mines* during the past summer, and underground work has continued.

Some prospecting of the *Edwards claims* at Chips Flat was contemplated.

Gold Canyon and *Rainbow Extension* claims were taken under one management and work continued during the latter part of the year.

A new hoist was being put in at the *Irelan Mine* late in the fall.

Kate Hardy Mining Company has been running the mill on their mine just below Forest and report that the proceeds have been contributing toward the cost of prospecting.

The lease and option on the *Oriental* and *Dead River Groups* of claims was abandoned by *Tonopah Mining Company* after considerable unproductive work. Very soon afterward, Bert Austin and associates took the lease and option and began work.

Prospecting work has been going on at the *North Fork* claims near Forest.

The *Plumbago Mine*, which was being reopened at the time of the last report, has since been taken under option by *Alleghany Mining Company*. Some rich specimen rock was reported to have been found by the former operators just before the transfer was made.

The *Rainbow Mine* produced a bunch of rich ore during the year, but not sufficient to repay the outlay for prospecting, according to the company's engineer.

The *Sixteen to One* completed many surface improvements and additions to the mill during the year, and as noted above remained the principal producer of the county.

In the Downieville district there was not much mining activity aside from the seasonal work in the many small drift mines, where parties of two or more men are employed each summer. There have not been any important developments, however, in this branch of mining in the district recently.

Bessler Bros. make an occasional small crushing of ore in the mill on their mine just outside the town of Downieville.

City of Six Mine comprises seven claims, unpatented, lying at the head of Slug Canyon two miles west of south of Downieville by trail. It is being developed under lease and option by A. E. Hodgkinson, 801 Lane Mortgage Building, Los Angeles.

Development work on the quartz claims to October of this year consisted of two adits. No. 2 or upper adit was run as a crosscut 100 feet then on the vein formation and the serpentine contact southward for 800 feet. The lower adit, which is 360 feet lower than No. 2 and 960 feet north of it, has been run about 1200 feet on or near the serpentine contact. The vein varies in width from a foot or less up to $4\frac{1}{2}$ feet, and in general is parallel to the contact of serpentine and Calaveras formation. From the two adits a few raises and crosscuts were run and there are two possible ore zones indicated, both raking south at a steep angle. These two shoots have produced some high grade ore similar to that from the Alleghany mines, and the property is similar geologically to the mines there. The greatest depth reached by the lower adit is about 485 feet.

Dan McGonigal, J. T. Lane and H. G. Smith were cleaning out and reclaiming the old workings of the *Finney* (or *York*) *Mine* just outside of Downieville during the past fall. The four claims and millsite of this property lie on both sides of the river. There is an old shaft 150 feet deep, with some drifting and stoping at a depth of 100 feet, and also an adit 350 feet long in which they were clearing a caved section. The mine has a record of some past production of high grade.

Gold Bluff Mine a mile from Downieville was taken under bond and option in the fall.

Tuolumne County.

QUARTZ MINES.

Many prospecting projects that were under way during the year in this county have been suspended; numerous new ones have taken their places, but in point of size of operations and number of men employed, the county has suffered a loss. The fixed price of gold relative to the cost of other commodities, which have been maintaining a high general price level, has especially affected the quartz mines on the Mother Lode in this county, as the ores that have been mined on that lode in this county have been as a rule low grade, taken as a whole. Before the war many properties kept running on rock that averaged \$3 to \$5 a ton and a recent perusal of old reports showed there were about 400 stamps in operation in the county in 1913 and 1914. In November, 1923, there was only one mill, containing 12 stamps, in operation on the Mother Lode in the county.

Alabama Mine. Work on this property, which had been carried on by the *Tonopah Mining Co.* during the year 1922, was suspended last spring. The claim was prospected through the Crystalline shaft, six hundred feet deep. Drifting was carried under the old Alabama shaft on the 600 level to prospect for the downward extension of ore.

Belmont Shawmut Mine closed down early in November, 1923. This was the last large mill operated on the Mother Lode. The owners returned to do some work after the Belmont Mining Company quit.

Crystalline Mine. Work was suspended in this property near Jamestown in the summer.

Casa Madera Gold Mines Syndicate, a Nevada corporation, has under lease and option a number of claims in the Basin Slope district, 20 miles by road and steep trail from Sonora via Confidence, three miles being by steep trail, or 8 miles from Tuolumne over a steep road. J. H. Sharpe, president of the company, Hearst Bldg., San Francisco. The claims are owned by John Nash and Rooker and adjoin the old Lewis Mine, once productive. They are near the contact of a gabbro intrusive and the extremely hard slaty quartzites and micaceous schists of the Calaveras formation. The intrusive is exposed on the mountainside just north of the workings and shows a sheeted zone the plane of which strikes northwest and dips 45° west.

The upper or No. 1 adit has been run east about 300 feet on a tight seam without quartz or gouge although the operators claim some assays. This is about 800 feet below the summit of the hill. A short way inside the portal of this adit, a crosscut has been run on a joint fissure striking about south, to follow a small bunch of sulphide ore that formed around the junction of the two joint seams. On the hillside about 100 yards south of the mouth of this adit and about on the line of the crosscut if produced, a small shallow prospect hole shows hard quartz carrying galena and other sulphides. There are no definite walls or gouge here, but there appear to be two systems of joint planes in the schist, one striking southeast and dipping vertically, and the other striking west of north and dipping 40° west. No. 2 or lower adit, 100 feet vertically below No. 1 was 60 ft. long on Nov. 3 and

showed the formation at the face similar to No. 1 adit, but the rock carries considerable sulphide.

A milling plant was being installed just below No. 2 adit when visited. It is to contain a ball mill of 40 tons capacity and 2 Plat-O concentrators, and 35 h.p. motor to run the mill. All this machinery was on the ground, as well as a 10 x 10 in. air compressor run by 50 h.p. motor at the lower adit and a 20 h.p. gas engine and 1-drill compressor at No. 1, with a tramway for supplies from the top of the ridge to the mill. Electric power was brought three miles from Confidence during the summer. The company has broached the idea of getting a water supply by running the upper adit ahead to tap the old mine workings nearby. This would be an uncertain and expensive method. If ore has been found on the surface of the claim as reported, it appears that erosion must have lain bare one of the west-dipping joint planes, which coincides with the present surface of the hillside in places. If this has occurred, the almost inevitable result would be an overestimate of the amount of ore available. The amount of work done had not yet justified a mill. Twelve men were employed in November, of whom three were working underground.

Clio Mine. Clio Vindicator Mines Co. A new surface plant is under construction at this mine, $\frac{1}{2}$ mile south of Jacksonville on Tuolumne River. A new headframe is up and hoisting is to be done directly to the surface dispensing with the old adit. A new 10-stamp mill is being prepared for to replace one lost by fire.

Cherokee Mines, Consolidated, of Modesto has been doing some work at the *Donella Mine* at Arastraville and have also reopened the old adit on the Cherokee Gravel Mine, a mile and a half north of Tuolumne and are reported to have hauled some cemented gravel for a test run at the Columbus mill.

Erin-go-bragh Claim. During 1923 J. L. Bryson and associates have sunk a shaft 92 feet deep on this claim at Stent. Early in November the claim was idle, but it was stated that a few rounds of crosscut had been run and that work had stopped only a few weeks before. The crosscut was required on account of the shaft being flatter than the vein, but it could not be learned if the vein had been picked up.

Experimental Mine. Conlin Bros., Columbia, owners. Lately this mine has been taken under a ten-year lease with option to purchase by L. L. Coffey and F. L. Mitchell, who formed a stock company. Wolfley and Schank have taken an option on the majority of stock and work had begun in November with shaft repairs. The geology and workings of the mine are briefly described in Preliminary Report 8. This mine was being profitably worked in 1854, when a mill of 8 square stamps with wooden stems was put up and used to crush rich ore from near the surface.

Harriman Mine has lately been taken under lease and option, which were later transferred to A. G. Fraser and J. Hibbard of Los Angeles.

Heslep Mine. This old Mother Lode mine at Quartz has lately been leased to J. A. Keyes and associate, their lease embracing, however, only the section from the surface to 300 feet in depth. Keyes was

foreman at the mine at the time of the big cave in 1912, when a length of about 300 feet on the north end was lost, and he knew of good ore that had been left in the upper workings. The Heslep vertical shaft is about 50 feet south of the caved ground and is being used by Keyes. The stamp mill has been moved from the Patterson Mine near Tuttle-town and 10 stamps have been erected and are in use, besides which two stamps are occasionally used.

Cost of mining and milling are low on account of the special conditions and the short distance ore is hoisted. Ore value at the same time is satisfactory, and will leave a very handsome margin of profit if the ore continues to mill as well as in October and November. Keyes states this ore shoot is about 260 feet long and six feet thick, and is in the Whitford vein which lies between the Heslep and Bull Quartz veins.

Hudson and Calhoun Pocket Mines near Sawmill Flat have made a small production of gold during the year.

Red Cross (Omega) Mine which was reopened for a short time during the summer has been closed down and is idle at the end of the year. Little more than unwatering and repair work was accomplished.

Some work has been done at the *Spring Gulch Mine* since July of this year. The shaft was cleaned out and repaired to the 200 ft. level, and crosscutting on this level is reported to have exposed a hitherto unexplored vein, which lies in the footwall of the Marshall vein, the one formerly worked. The operators planned to drift on this new vein. The mine is about five miles southeast of Tuolumne and was not visited.

A little work has also been done during the summer at *Tomescal Mine* 2 miles from Confidence. Two men were employed.

DRIFT MINES.

Monarch Mine is near Confidence. *Monarch Gravel Mining Co.*, Jerry Casey, secretary, 510 Page street, San Francisco. The company has kept at work since the 1920 report. There are now (Nov., 1923) 3500 feet of tunnel and crosscuts, mostly main tunnel. A shaft was sunk 135 feet deep on 25° incline at the face of the main tunnel and is reported to show coarse gravel. A winze level 100 feet below the main tunnel has also been run about 100 feet. A new shaft to furnish air and a second exit was being sunk in November to connect with the main tunnel. The gravel noted above as having been found below the main tunnel had not been prospected and nothing is known yet as to its extent.

Sledge Mine is about 4 miles by road from Confidence. The property has been prospected and worked in a small way for many years by the Sledge family but as far as could be learned without much output. It was drilled by *Tuolumne Deep Channel Mining Company* about 1913. A tunnel was also run 200 feet or more by former operators. The last company, which suspended work during the present year, is said to have spent about \$35,000 on the property. Several new buildings were put up and the tunnel was extended to a total length of 600 feet.

Gravel shows in the face of the pit, near where the tunnel enters. The course of the tunnel turns west, northwest and north and strikes rim gravel near the face. This is apparently an intervalvic channel, most of the sand and gravel being green with very little quartz. No work was done after striking the gravel. About a quarter of a mile ahead of the face of the tunnel presumably along the supposed course of the channel, a shaft had been started, but was nearly full of water at time of visit and had apparently not reached gravel, judging from the material on the dump. As no crosscutting nor drifting had been done in the gravel, the width, depth and direction could not be judged except by surface indications.

Springfield Tunnel and Development Company have continued to work their mine on a small scale. When the work had reached the old shaft where such a fine prospect had been found several years ago that they were led to great exertions and expense to reach it with a tunnel, it is reported the rich ground was found to be limited in extent, and they found mostly lower grade gravel surrounding it.

MARBLE.

Bell Marble Company, office address S. P. Building, San Francisco. The quarry at Columbia was being worked again in November after an idleness of six months. A crew of six men is employed. A Sullivan double channeling machine has been installed and a new 50-ton stiff leg derrick has been erected.

The market for marble is reported good but the demand is said to be principally for sawed slabs. The company is now selling stock to finance a marble sawing mill at West Berkeley. The Bell Marble Company has helped to build up a new industry in California raw material and has experienced the satisfaction of establishing the high quality of its product in competition with eastern and other marbles.

Columbia Marble Company continues the operation of its large marble quarry on the south side of the Stanislaus River canyon north of Columbia. This company has its own marble sawing mill and has been a steady producer for many years.

GRANITE.

Sonora Granite Company has a quarry on the Rablen Ranch in Sec. 14, T. 1 N.; R. 15 E.; three miles from a shipping point on the Sierra Railway. J. E. Sasek, manager, Jamestown.

The stone is a pleasing dark granodiorite. They have brought in electric power to the quarry and have an air compressor, a few small buildings with accommodations for ten men, and some small tools. A few carloads of the stone have been shipped during the two years of desultory work, but the quarry has been idle since last July.

MAGNESITE.

The *Gray Eagle Magnesite Mine* near Chinese Camp has been taken over under lease by H. R. Vail and John P. Maxwell, 820 Syndicate Bldg., Oakland. When visited in November last, they were building a calcining plant (see photo) on the Sierra Railway at Chinese Camp

station. The kiln is of 15 tons calcined product daily. The ore is hauled from the mine, a distance of two miles, by motor trucks.

The vein is developed through an adit which crosscuts it at 310' in, thence a drift has been run 50'. This level is at a depth of 98' below the outcrop, and 34' below the upper drift, which was driven from the bottom of the shaft. In the stope the vein shows 8' to 10' in width. Mining of the ore is being done under a contract.

Vail and Maxwell calcining plant at Chinese Camp, Tuolumne County, California, for handling magnesite from the Gray Eagle Mine. Photo by Walter W. Bradley.

SAN FRANCISCO FIELD DIVISION.

C. MCK. LAIZURE, Mining Engineer.

REVIEW OF ACTIVITIES IN 1923.

During the past year the Redding field division office was discontinued and the former Auburn field division office moved to Sacramento. This change necessitated a redistricting of the State and some change in the counties assigned to the present three district offices at Sacramento, San Francisco and Los Angeles, respectively.

Del Norte, Humboldt and San Luis Obispo counties were added to the San Francisco field division, and Glenn, Colusa, Yolo, Sutter, Sacramento and Mono counties were placed in the new Sacramento district.

The net result was that Mariposa is now the only gold mining county of any importance in the San Francisco field division.

METAL MINING.

Mariposa County was not visited during 1923, but reports indicate that it has shared fully in the general revival noted in gold mining activities throughout the State, and that the outlook for continued improvement of conditions in 1924 is favorable.

The only other metal of importance produced in this district is quicksilver. Some interesting speculations regarding a possible increase

in the use of quicksilver have developed since the reports of experiments with the Emmet mercury-steam boiler system have been made public in the technical press.

An experimental installation of this system on a commercial scale was made by the General Electric Company in the plant of the Hartford Electric Light Company, Hartford, Conn., and its successful operation demonstrated. Theoretically, this system permits increased efficiency of about 100 per cent over steam alone. At the test installation the increase in output of electric power per pound of fuel was practically 50 per cent. With boilers especially adapted to the system and other refinements, it is expected that an increase in efficiency of 80 per cent over the present practice of steam-power plants will be reached.

Such a wonderful saving would lead to the conclusion that in a short time mercury will be used in all steam-power plants; however, the following figures will show that the world's production of quicksilver is far too small to meet such a demand.

According to the Engineering and Mining Journal-Press¹ "the Emmet boiler at Hartford holds about 30,000 pounds of mercury. The total production of mercury in the United States in 1919 was 1,601,000 lb., enough to equip only fifty-three boilers like the one already equipped, which has developed about 1500 k.w. or nearly 2000 h.p. In 1922 the mercury produced in the United States had fallen to 478,000 lb., or enough to equip sixteen boilers of the size of the Emmet installation at Hartford. This United States production was, to be sure, only about one-fifth of the average production for nearly twenty years; nevertheless, it is clear that these twenty years have skimmed the cream from our deposits.

We have a tentative figure of the total amount of boiler horsepower used in the United States in the mining industries at 2,258,000 h.p., which, taking the amount of mercury required for the Hartford boiler, would require altogether nearly 34,000,000 lb. of quicksilver, which is more than the total amount of quicksilver produced in the United States in the last twenty-one years—1902 to 1922 inclusive. But the total amount for all purposes in the United States is 18,000,000 h.p., whose equipment would require 270,000,000 lb. of mercury!

The world production of mercury in 1921 was only 4,451,000 lb., enough to equip only 148 boilers of the size of the Hartford plant! The total world's production for fourteen years from 1908 through 1921 inclusive was 110,337,000 lb., or less than half what would be required to change the high-pressure steam boilers of the United States alone to the mercury system."

As a further illustration of the revolutionary character of this system, it is said that the mercury used in the Hartford plant boiler cost about \$16,000. This represents a considerable sum of money, but officials of the Hartford Electric Co. expect their coal bill to be cut in half by the installation of this boiler system, and their coal bill in 1922 was about \$1,500,000, showing that they would save the cost of the mercury, at that price, in about eight days. Even with a much higher price for mercury, such an installation would prove economical in many cases. The mercury is used over and over again and need not be replaced.

¹Eng. & Min. Jour.-Press, Vol. 116, No. 25, page 1057, Dec. 22, 1923.

It is quite evident from these figures that, if the demand for quicksilver for mercury-boiler power purposes grows, the lack of supply will send quicksilver prices soaring, and even this use in only a comparatively few boiler plants is likely to cause an immense increase in the price of the metal.

The principal producers in 1923 were the New Idria Quicksilver Mining Co., the New Almaden Co., Inc., and the Cloverdale mine of the Western Mercury Co. Mercury produced was about 75 per cent greater than the 1922 output.

Announcement has been made by Mr. Andrew Rocca, president of the Western Mercury Co., of the sale of the Cloverdale mine to H. W. Gould, et al.

The Helen mine, situated near Middletown, Lake County, has been purchased by Ludwig Graefe and A. Romaine.

A small production of manganese ore was recorded from San Joaquin and Stanislaus counties.

NON-METALLIC MINERALS.

Although the mining of metals is limited, the mineral products of the twenty-five counties in this division approximates 25 to 30 million dollars annually, or twice the total gold production of the State. The products are chiefly those minerals classified as fuels, structural materials, industrial materials and salines; and they include petroleum, natural gas, coal, brick and tile, cement, granite, lime, magnesite, sand and gravel, crushed rock and other miscellaneous stone, asbestos, pottery clay, dolomite, gems, gypsum, diatomaceous earth, limestone, mineral paint, mineral water, silica, sulphur, magnesium salts, potash, common salt and a few other minor minerals.

The mining and marketing of these products differ widely from metal mining in general and especially from gold mining. The gold producer has an unlimited market for his product at a fixed price of \$20.67 per ounce, while the production of the structural and industrial minerals, fuels and salines is on a competitive basis. In the case of large mineral deposits of comparatively uniform composition, mining operations acquire many of the characteristics of a manufacturing industry. For aiding in the development of the mineral industry, reports upon the activities of going concerns of this character are of less value than are data on undeveloped deposits and new discoveries.

Fresno County, the principal mineral products of which are petroleum and natural gas, leads in value of production in this district. At the same time 'wildeat' drilling has continued more or less steadily in over half of the twenty-five counties, but to date no new commercial production has been established. That there are possible producing areas in this district, yet unproved, is unquestioned concerning both petroleum and natural gas.

Lively interest has been shown in the coal deposits of the State and development in this district has been carried on in Mendocino and San Benito counties, with additional activities probable in Contra Costa, Alameda and Monterey counties. A report upon the Eel River district in Mendocino County, where development work has been particularly active, was published in Report XIX of the State Mineralogist, Chapter IV, September 1923.

Coal investigations have taken the form of the possible utilization of California lignite in the production of pig-iron and steel in the electric furnace under the Driscoll patents. This is a process in which the volatile gases are driven from the coal and used in a gas engine to generate the required electric current. The carbon remaining is utilized to reduce the iron ore to metallic iron (sponge iron), which is then melted in the electric arc. The apparatus comprises a combination rotary kiln and electric furnace and the process is continuous. Small scale tests have shown California lignite to be suitable for this process. Others have investigated the low-temperature distillation of the lignite under a German patented process with the production of a semi-coke briquette, said to be an ideal smokeless domestic fuel, and other by-products. Still other investigators are figuring on the manufacture of calcium carbide (CaC_2) from lime and lignite coal. Apparently, the time is not far distant when the coal deposits of California will be developed to a much greater extent than at present; the better grades being used for domestic and steam fuel, in competition with imported coal, and the lower grades as powdered coal, in the manufacture of producer gas, or in one or more of the other industrial processes outlined above.

The demand for building materials continued active during 1923 and the established cement plants in this district, one each in Contra Costa, Solano, Santa Cruz and San Benito counties, enjoyed a prosperous year.

Pacific Portland Cement Company started the construction of a 2000 barrel per day unit of a new cement plant, located on San Francisco Bay near Redwood City, approximately at the site of the construction and launching during the war of the concrete ship, Faith.

The wet process of manufacture will be used. Two of the principal raw materials, oyster and clam shells, and clay, will be obtained from the bay bottom by a suction dredger, and conveyed to the plant. These shell deposits are said to be practically inexhaustible. The plant is expected to be completed by July of this year. Its location gives it the advantage of direct water and rail shipment for the finished product, while at the same time the principal raw materials are at hand.

It is reported that the Guadalupe Portland Cement Company expects to build a plant six miles southwest of San Jose, which will have an initial capacity of 2500 barrels per day. An immense hill of limestone is said to have been acquired in the vicinity of the proposed plant.

Yosemite Portland Cement Co. began construction of a large cement plant at Merced. Limestone occurring near El Portal will be utilized.

MAGNESITE.

Magnesite production, which is confined almost entirely to the San Francisco field division, showed a healthy growth during 1923. Several old properties were re-opened and one new deposit was worked.

The following data on the active magnesite properties in the district were prepared by Mr. Walter W. Bradley, deputy State Mineralogist, as the result of a short field trip.

Napa County.

Maltby No. 2 Magnesite Mine, C. S. Maltby, Humboldt Bank Bldg., San Francisco, lessee. The lease covers the old *Blanco* and the *Snowflake* mines, owned by the Tulare Mining Company, the first-named

having been operated by that company during 1917 and 1918. They were among the first magnesite mines to be worked in California, shipments having begun in 1891 and continuing for ten years at a rate of over 1000 tons per year. They are in Sec. 28, T. 8 N., R. 4 W., M. D. M. about two miles south of the old Chiles mill in Chiles Valley.

Since taking over this property in February 1923, the present lessee has driven a new adit in the Blanco ground 1000' long which crosscuts the vein at 78' on the dip (or 53' vertical) lower than the bottom level of the former operators. Drifts have been run 100' north and 165' south, the vein showing an average of 6' in width. The ore is being broken down by overhand stoping, and the small proportion of waste is sorted in the stopes, by forks and by hand.

Calcining equipment consists (see photo) of a rotary kiln, 3½' inside diameter, by 50' long, driven by a 6 h.p. gas engine and oil fired. The

Calcining plant at Maltby No. 2 Magnesite Mine, Chiles Valley, Napa County, California. Producing dead-burned magnesite in a rotary kiln. Photo by Walter W. Bradley.

ore is crushed to pass 1-inch mesh before charging to the furnace, and is dead-burned for refractory purposes. The output of the furnace is 15 tons of calcined material per 24 hours. This rotary kiln was formerly in use for quicksilver reduction at the Bella Union quicksilver mine near Oakville in the same county. The calcines as discharged from the furnace are raised by a bucket elevator and run over a sheet-iron chute to the bunker, from which the motor trucks are loaded which haul the product to the railroad at Rutherford. Maltby states that he is having a ready sale, mainly on the Pacific Coast, for the dead-burned magnesite which he is producing here and at the Sampson mine in San Benito County, which he is also operating.

The *White Rock* magnesite mine in Pope Valley, operated by C. S. Maltby of San Francisco under lease during 1921-1922 was closed

down early in 1923 and the movable equipment transferred to the Blanco mine in Chiles Valley. It is stated that the orebodies of the White Rock were bottomed at a depth of 300 feet below the outcrop.

San Benito County.

The *Sampson Magnesite Mine* (known also as *Maltby No. 3*), west of Idria, is being operated under lease by C. S. Maltby, Humboldt Bank Bldg., San Francisco. The six vertical kilns formerly in use at this mine have been replaced by a rotary furnace 7' by 80' (see photo), operating at $1\frac{1}{2}$ minutes per revolution. It is oil-fired and is producing 35 tons of dead-burned magnesite per 24 hours. The ore is crushed to $\frac{3}{4}$ -inch mesh before charging, and $2\frac{1}{3}$ tons of crude ore are required

Calcining plant at the Sampson Magnesite Mine, west of Idria, San Benito County, California. Producing dead-burned magnesite in a rotary kiln. Photo by Walter W. Bradley.

for 1 ton of calcined. Steam power is used. Fuel oil is obtained from the pipe line of the Associated Oil Company at Mendota, there being a pumping station on the line at that point. The calcined ore is hauled by trucks to the railroad at Mendota.

As the orebody is on top of a ridge, the ore is broken by quarrying operations, and carried to the furnace by a Painter aerial tram, 5000 feet in length, having 16 buckets and being gravity operated. Jack-hammer drills are used in the quarry. The compressor is driven by a 4-cylinder gasoline engine which formerly did duty in a Packard automobile. At the time of our visit (in November, last) it was certainly shooting merrily along on all four with a sharp bark out there on the open hillside without any muffler to worry it.

Santa Clara County.

The *Western Magnesite Company's* properties (known also as *Maltby No. 1 Mine*) 33 miles southeast of Livermore have been operated under lease by C. S. Maltby, Humboldt Bank Bldg., San Francisco, since 1919. Many improvements have been made in the plant equipment, and new orebodies have been developed. The earlier underground operations were due east from the furnaces, and some ore is still being drawn from that portion of the property. Later developments have been towards the north and northwest from the older workings. While none of the north-end stopes have as yet reached the size of some of the older south-end orebodies (there was one, 300' long x 50' wide x 300' high;

Tramming ore from north end workings at Maltby No. 1 Mine (Western Magnesite Development Co.), on Red Mountain, Santa Clara County, Cal. Photo by Walter W. Bradley.

and another 200' long x 150' high x 30' wide), some are over 20' wide in places. The ore is of the same, white, high-grade character.

Ore from the north end is trammed around the hill (see photo) to the loading bunkers of the main aerial tram (of which there were two). When visited in November 1923, preparations were being made for the installation of a third aerial tramway, at the north end, in order to eliminate the long haul around the hill. A total of 150-200 tons of ore per day was being delivered to the furnaces, of which 40 tons was being mined at the south end, 30 tons from the extreme north end, and the balance from the main north workings. A new 4-inch pipe line was being laid direct to the north end to serve those workings with compressed air, in place of the line from the south end around the hill.

Pressure is maintained at 100 pounds at the compressors (two 50 h.p. Chicago Pneumatic, direct-connected to oil engines; also a Doak compressor as extra stand-by) and at least 90 pounds at the mine.

There are four upright kilns which burn the lump ore, and a Scott fine-ore quicksilver furnace which handles the fines. The ore as it comes from the mine is dumped on grizzlies set with a $1\frac{1}{4}$ inch opening; and the through material passed over a $\frac{3}{4}$ -inch screen. The plus $\frac{3}{4}$ -inch material goes to the Scott, and the minus $\frac{3}{4}$ -inch to the waste dump as it contains mostly impurities. There is a Thwing electric pyrometer on the Scott furnace, by which the temperature is maintained at 2100° F. The calcines are drawn each hour, and an output of 20-24 tons per day obtained. The upright kilns are drawn every 2 hours, and their output totals 50 tons daily for the four. The burned lump ore is carried by a belt conveyor to a trommel with 1-inch apertures. The waste and off-colored magnesite are picked off the belt. The unburned cores after passing out of the trommel are hauled back to the main ore bin and re-burned in the kilns. Steam for atomizing the fuel oil is provided by two boilers, of 100 h.p. respectively. There were 14 motor trucks in service, hauling the calcined magnesite to the railroad at Livermore.

Tulare County.

Magnesite mining in Tulare County at the present time is practically confined to the several properties operated by the Sierra Magnesite Company, and to the Hoff-Harker lease on the old Harker or Porterville Hill mine.

Harker Mine. This property is owned by Mrs. Barngrover, Porterville, widow of Chas. S. Harker, and is at present under lease to Hoff & Harker. From 1915 to 1921 it was operated by the *Porterville Magnesite Company* and a large tonnage of ore mined, a part of which was calcined before shipping. It is two miles from the railroad at Porterville. During 1922 the property was operated under lease by the Sierra Magnesite Company, the ore being calcined in their furnaces at Porterville.

When visited in November, 1923, the rotary kiln was not in use, the present lessees confining their work to a vertical kiln of 15 tons calcined daily capacity. The product is shipped for plastic purposes. There is a small crushing plant, the equipment of which includes a hammer mill and a buhr mill for grinding the calcined material, although not being utilized at the time. The ore is being mined from the veins on the north side of Porterville Hill and hauled by motor trucks around to the furnace, which is on the south side of the hill.

Sierra Magnesite Company. This company was organized in 1920, and took over all of the important producing properties in the vicinity of Porterville, which they still retain with the exception of the Harker Mine (Porterville Magnesite Company) which, however, they operated during 1922. The Sierra company now owns in fee the properties described in preceding reports of the State Mineralogist¹ under the following names: Rex Plaster Company, Lindsay Mining Company, Tulare Mining Company, and mineral rights of the Oakland Magnesite

¹ Report XV, pp. 919-940, 1917; Report XVIII, pp. 528-535, 1922.

Company on 80 acres adjoining the Harker Mine on the north. This company also has a lease on the magnesite deposits on the Gill ranch adjoining the Oakland ground on the north. The first three groups adjoin and are in the Success district 7 miles east of Porterville. The Oakland-Gill groups are on the north of Porterville Hill 3 to 4 miles northeast from the railroad station at Porterville. At present, mining operations are confined mainly to the 'Tulare' ground, and portions of the 'Lindsay' and the 'Gill Lease' properties, the last-named being worked under a contract by Ed. Cramer. All calcining is done in rotary furnaces at their plant in Porterville (formerly American Refractories Company; also American Magnesite Company a subsidiary of International Magnesite Company). Ore from the Success district is brought in by rail over the branch line of the Southern Pacific Company, and from the others by motor truck.

The National Kellastone Company, of which the Sierra Magnesite Company is an associate (being controlled by the same financial interests), has one of its stucco plants here, where stucco mixtures are prepared for sale to contractors and material dealers. All of the technical control work of the National Kellastone Company is carried on at Porterville in the physical-test and chemical laboratories. Both of these laboratories are especially and completely equipped for such work. Because of the high summer temperatures, there is a below-ground basement room under the physical-testing building for use in the summer months, so that fairly uniform temperatures may be had for testing throughout the year.

Because of their careful technical control a uniform product of guaranteed behavior can be delivered. Their three commercial grades, with approximate chemical analyses are as follows (it being understood that the guaranteed physical tests are of more vital concern than a specific chemical composition):

'Sierra Standard.' White or light gray color when ground; MgO 83%–85%; CaO (under 4% total; 1.5% active); Al_2O_3 & Fe_2O_3 under 1%; SiO_2 up to 8%. Ignition loss 2%. Used for finish-coat stucco.

'Tulare A.' Cream color; MgO 85%–87%; Al_2O_3 & Fe_2O_3 3%; CaO (3% total, 1½% active); SiO_2 5%–6%. Ignition loss 3%. For flooring finish coat; also some for stucco.

'No. 20' or 'Base Coat' (also called 'No. 20 B.C.'). Color varies, dark cream, light brown, etc. MgO 80%; CaO 3%; Al_2O_3 & Fe_2O_3 about 4%; SiO_2 12%–14%. Ignition loss 4%. For base coats, both in stucco and floors.

Fine grinding of the calcined material, in preparation for stucco and plaster mixtures, is accomplished in 12 buhr mills in two banks, so that 85% will pass 200 mesh.

In November, 1923, there were 75 men employed in the mine, and a total of 49 in the plant, laboratories, and office, including 9 in the National Kellastone unit.

OTHER NON-METALLIC MINERALS.

An effort to increase the use of agricultural limestone, gypsum and other so-called mineral fertilizers is evident, and among the new operators in this district are the Mt. Diablo Lime and Marl Co., Walnut Creek, Contra Costa County, and the Mission Lime Marl Co., of Irvington, Alameda Co.

Various colored rocks, when crushed and sized, are used as a 'dash' coat on stucco for exterior finish and for roofing. There is a good demand for hard, bright-colored material. Obsidian was produced for this new use during 1923, the production coming from near St. Helena, Napa County.

The foundry men of America have raised a fund for carrying on detailed tests and research work on samples of sand which are being used or which may be thought suitable for foundry molding use. The tests are being made under the supervision of the Engineering Division of the National Research Council, with the cooperation of State Geologists and the U. S. Geological Survey.

In order that the producers and users of molding sand in California might benefit from this investigation, the State Mining Bureau has cooperated to the extent of collecting samples from all known deposits and reporting upon their character, size, method of working, ownership, etc.

Samples from two producers in the San Francisco field division were procured and included in the total of twelve samples sent from this State. These two were from the deposit of the Del Monte Properties Company, near Carmel, Monterey County, and from the George Small deposit, on the Alameda Creek road, near Decoto, Alameda County. The Del Monte Properties Company produce sand for a variety of uses, but the George Small deposit is strictly molding sand.

A new plant for the recovery and production of various magnesium salts from the bitterns remaining after the precipitation of common salt from sea water was completed in 1923 by the Industrial Chemical Corporation, and is now in operation. The plant is located on the property of the Arden Salt Works near Newark, Alameda County; the bitterns from the Arden Salt Works being taken under contract. E. M. Vail is manager, Newark, California.

Much of the San Francisco division engineer's time is taken up in routine office duties and in replying to written and verbal requests for information relative to all phases of the Mining industry.

After the discontinuance of the monthly publication of 'Mining in California' in April, the service formerly offered 'Producers and Consumers' in this publication was continued by issuing a monthly mimeographed list of current inquiries for deposits and tonnages of minerals 'wanted' and 'for sale,' under the title of Commercial Mineral Notes. Apparently these lists have been of considerable value to those looking for a source of supply and to prospective producers seeking a market, as the State Mining Bureau has been advised of a number of transactions closed through its aid, or under negotiation.

It has also been noted that these listings are closely watched by many large and responsible firms, who form an increasing percentage of those investigating offers. Requests for various minerals come from the manufacturing centers in the eastern states, a few from foreign countries, and many from local firms and individuals. Only deposits in California, or tonnages originating therein, are intended to be listed for sale.

During the year 303 parties seeking a market were listed; there being 88 different products offered by them, and 152 separate 'wants' were listed, which included requests for 102 different mineral products. The larger part of the 'wants' was for non-metallic minerals of the

structural, industrial, fuel and saline groups, with a lesser number of inquiries for gold and other metal mines.

Inquiries for arsenic ores, clay, magnesite, coal, manganese, limestone, montmorillonite, quicksilver, sillimanite, andalusite and cyanite were comparatively frequent. Other minerals wanted included zeolite, lepidolite, gilsonite, flint, epidote, beryl, amblygonite, alunogen, asbestos, molybdenite, jasper, as well as the more common minerals.

With very few exceptions, all of the minerals wanted are known to occur in the State, but as yet some of them have not been found in commercial quantities. In many cases this may be due to lack of knowledge of the valuable non-metallies on the part of prospectors. Sillimanite, for which there is a keen demand, would scarcely attract the attention of one not especially searching for it, as much of it resembles an ordinary worthless rock. The only deposit so far being mined in the United States is in Mono County, California, but it is quite certain that other deposits of commercial size will be found, and, if so, they should prove valuable to the discoverers. Sillimanite is used in the manufacture of high-temperature and high-tension electrical insulators and spark plugs. That produced here at present is being shipped to Detroit, Michigan. It is worth about \$.05 per pound, or \$100 per ton, as mined.

LOS ANGELES FIELD DIVISION.

W. B. TUCKER, Mining Engineer.

Imperial County.

Shipments of pumice are being made from a deposit owned by J. H. When, G. E. Miller, and D. S. Underwood of Niland. The deposit is located near Niland, and it is reported that during the month of August, 1923, seven cars were shipped to Chicago.

Inyo County.

CERRO GORDO DISTRICT.

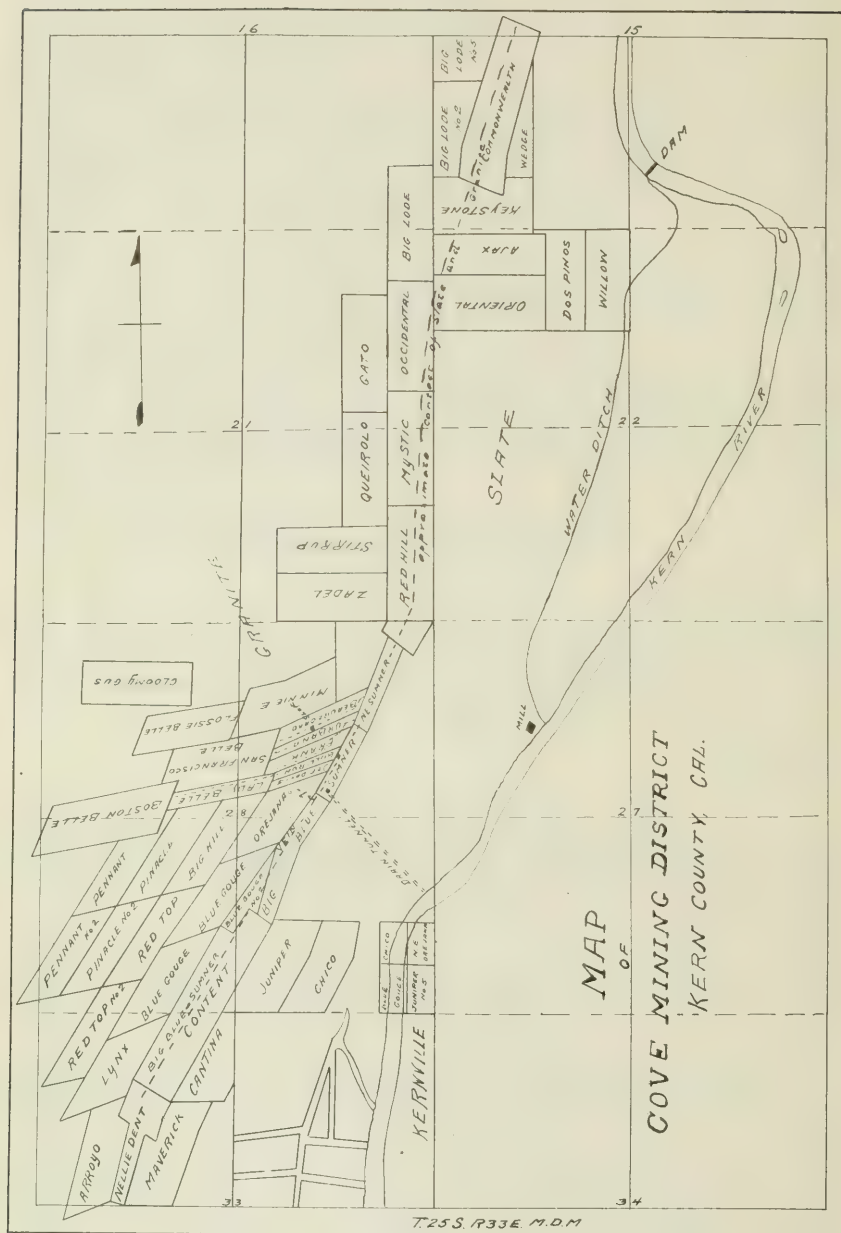

The Cerro Gordo Mines Company reports that a new ore body, carrying high grade silver values, has been encountered at a depth of 1000 feet in the old Union Mine. The vein is said to have a width of four feet.

Queen of Sheba Group of Mines, consists of nine claims located in the eastern slope of the Panamint Range of mountains, about 40 miles northeast of Zabriskie, a station on the Tonopah and Tidewater Railroad.

Owners: *New Southerland Divide Mining Company*, of San Francisco. The property has recently been leased to the *United States Smelting Refining and Mining Company*; main office, 55 Congress Street, Boston, Mass.

The ore occurs as replacement ore bodies in limestone and is rich in galena, lead carbonates and silver sulphides. The ore is said to average 15 per cent lead, and 8 ozs. of silver per ton. It is stated that 6500 tons of sorted ore shipped to the smelter near Salt Lake City averaged 40 per cent lead and 20 ozs. in silver per ton.

It is reported that the *United States Smelting, Refining and Mining Company* expect to start mining operations at an early date.

Kern County.

COVE MINING DISTRICT.

The Cove Mining District is situated 42 miles north of Caliente, near the town of Kernville. The mines are at an elevation of 2600 to 3000 feet above sea level in the foot hills of the High Sierras. The district is connected by a good mountain road with Caliente, on the Southern Pacific Railroad, which is the nearest railroad point.

History: The first discovery of gold in this region was made by a member of General Fremont's party in 1851, in Greenhorn Gulch. In 1861, Rogers and Old discovered gold on what is known as the Beauregard vein, near Kernville. The discovery of the Beauregard, Jeff Davis, Lady Belle, Bull Run, and other mines of this region, led to the formation of the Cove Mining District.

The Beauregard Company installed a mill of eight wooden stamps, and it is stated that their production was from twelve to fifteen thousand dollars per month. At a depth of 65 feet, the vein was five feet wide, and the ore is said to have milled \$70.00 per ton.

The original claims located on the Jeff Davis, Bull Run, Lady Belle, Frank, Urbana, and Beauregard veins were 200 feet wide by 1200 feet in length. In 1875, the Sumner Gold Mining Company was organized and consolidated the principal claims in the district. A sixteen stamp mill was erected, which was increased later to eighty stamps. This eighty stamp mill operated until 1883. The weight of the stamps was 850 lbs., crushing the ore to about 40 mesh, using straight amalgamation, and no attempt was made to save the concentrates. It is stated that the production of the mill during this period varied from twenty-five to seventy-five thousand dollars per month. At the time of maximum production, the operations were carried on through the Sumner shaft, located on the Big Blue-Sumner vein. This shaft was of six compartments, and equipped with steam driven hoist and cornish pumps. In 1882, a drain tunnel was started from the river level to cut this Sumner shaft at a depth of 260 feet. In 1883, the shaft house, hoist, pump equipment and shaft timbers were destroyed by fire, and the lower levels of the mine flooded. This company completed the drain tunnel over 2000 feet in length to the Big Blue Mine, which drained the upper workings.

After the fire of 1883, ore extraction was confined to stoping above the 240 foot level. The control of the company then passed to the Kern Development Company, who adopted a leasing system.

Up to the time of the organization of the Sumner Company, no definite records of production were kept at the mines. The Sumner Gold Mining Company showed records of production of 151,000 tons, which yielded \$1,250,000 or \$8.27 per ton. Records of later production mainly from leases show over 37,000 tons of ore extracted from which \$13.43 per ton was saved. Total production of the Cove district is estimated as being from \$5,000,000 to \$8,000,000.

Estimated production of the various producing mines of the district is as follows:

Beauregard Mine \$600,000; Urbana and Frank \$200,000; Big Blue \$2,000,000; Blue Gouge \$75,000; Bull Run \$450,000; Jeff Davis \$150,000; Lady Belle \$500,000; Nellie Dent \$100,000; Sumner and North Extension \$600,000.

R. W. Raymond, U. S. Mineral Statistics, in 1875, stated that "the vein on the Nellie Dent mine is 200 feet wide between walls, and carries ore yielding \$10.00 to \$12.00 per ton."

R. W. Raymond, in Seventh Annual Report of the U. S. Commissioner of Mining Statistics, states: "the Sumner produced in 1874, 5000 tons of ore with an average yield per ton of \$40.00, total bullion product being \$200,000—number of stamps, 16; cost of mining per ton, \$2.50; cost of milling, \$2.00; kind of power, water. The lode underground is 80 feet wide between walls, and has been opened up for 1000 feet along the vein for a depth of 160 feet. The average yield was \$18.00 per ton."

From 1883 until 1901, the mines were operated under a series of leases. In 1921, the North Sumner Gold Mines Company acquired the Beauregard, Urbana, Frank, and North Extension Sumner Mines, and Lot No. 1, 33.48 acres of patented ground. The North Sumner Gold Mines Company started development operations on the Beauregard Mine in 1921, which has been in steady progress to date.

Geology and Vein Systems.

The formations consist of granite, slate and schist, the former predominating. Near Kernville, a narrow bed of slate and schist extends north and south, a distance of about 8 miles, and the Big Blue-Sumner lode occupies the contact. This belt of slates and schist is one to two miles in width and fifteen or more miles in length. The contact with the granite is irregular in outline and the Big Blue-Sumner vein occupies a fault which has broken through the various formations along the contact line. In places the slate and schist does not show for a considerable distance east of the Sumner vein, but notably on the Sumner North Extension, it should be in close contact. In the 2000 foot drain tunnel, we fail to find the slate, as the tunnel is in granite until it strikes the Big Blue vein, where it forms a part of the vein.

The Big Blue-Sumner vein occupies the line of the reverse fault. The vein is of great width, vein matter and quartz showing from 80 to 115 feet or more in width, and this lode is traceable several miles. The main lode has generally been regarded as composed of three veins, called the West Vein, which shows a width of five or six feet, the Middle, or Big Blue vein, which shows a width of about 40 feet, and the East or footwall vein, showing a width of about 5 feet. The filling between these veins is well silicified and somewhat mineralized, and in places the West and Big Blue veins merge.

In addition to the main lode, there are a number of veins striking N. 75° E. to N. 40° E., which occur in the granite west of the lode and should form junctions with main lode, probably on the North Extension Sumner claim.

The Beauregard, Frank, Urbana, Jeff Davis and Lady Belle veins were heavy producers in the early days, the ore being of higher value than the main lode.

Beauregard Mine is located in Sec. 28, T. 25 S., R. 33 E., M. D. M., in the Sequoia Forest Reserve, and three-quarters of a mile north of Kernville. Elevation 2860 feet. The property consists of one claim, (1200 feet long and 200 feet wide), making a total area of 6 acres, patented in 1882, and is owned by the Kern Development Company.

Cave Mining District, $3\frac{1}{4}$ miles in length. Big Blue and Summer lode along base of mountains. View from east side of Kern River.

Property of North Summer Gold Mines, Inc., looking north, and showing open cut on Big Blue Vein. Photos by courtesy of C. S. Long.

Property of the North Sumner Gold Mines, Inc. Photo by courtesy of C. S. Long.

The Beauregard and North Extension Sumner mines are under lease and bond and the Frank and Urbana mines are leased, by the North Sumner Gold mines. The adjoining claims, the Red Hill, Stirrup, Zadel, and Lot 1, consisting of 93 acres, have been deeded to the North Sumner Gold Mines, Inc.—a total area of 115.24 acres. P. V. Long is president; M. S. Baylor, secretary; R. L. Long, general manager. Office, 203 Merchants Exchange Building, San Francisco.

The present company started operations in August, 1921. There are five veins in the hanging wall granite, known as the Beauregard, Urbana, Frank, Lady Belle-Bull Run, and Jeff Davis, which probably form junction with the main fissure (Big Blue-Summer lode) on the Sumner North Extension claim. The Beauregard vein strikes N. 75° E., dip 85 degrees N. W., average width 4 feet. Pay shoot worked is said to be 600 feet in length, with an average width of 3 feet. Ore is

Big Blue Vein, 240' level—old stope, Big Blue and Sumner Mine. Photo by courtesy of C. S. Long.

free, and plates \$35.00 per ton, concentrates are said to have an average of \$150.00 per ton. This shoot of ore was worked to a depth of 200 feet. Workings consist of seven shafts from 100 to 300 feet deep, three levels, 2500 feet of drifts, and six stopes. The Urbana vein strikes N. 50° E., dips 75 degrees N. W., average width of 18 inches. Pay shoot is said to have been 600 feet long and 18 inches wide, free milling ore. Workings consist of five shafts from 50 to 180 feet deep, drifts and stopes. The Frank vein strikes N. 40° E., dip 77 degrees N. W., the vein forms a junction with the Urbana vein about 200 feet northeast of the Beauregard shaft, and also merges with the Beauregard vein on dip and strikes to the northeast.

The company has cleaned out and retimbered the Beauregard shaft, and is sinking this shaft to the 300 foot level. On the 200' level, the vein was found stoped 300 feet northeast of the shaft. This level has

been extended 350 feet northeast on the vein, to a point where the main north and south fault cut the vein off, and this fault was drifted on 200 feet to the northeast. A crosscut was also driven east 200 feet into slate footwall, cutting through the Big Blue-Summer vein. Water is secured from the Kern River through a ditch $3\frac{1}{2}$ miles long.

Equipment consists of Ingersoll-Sargent compressor, capacity: 650 cu. ft., driven by water turbine. Single drum hoist, driven by air and air drills, two Cameron pumps, assay office, ore bins and cars. Ten stamp mill, 850 lb. stamps.

Fifteen men employed.

Bibl.: Report XIV of State Mineralogist, pp. 487 and 488.

Big Blue and Summer, owned by *Kern Development Company*, C. S. Long, president and manager, Hayward, California; C. C. Hamilton, secretary. Office, 102 Exchange Building, Portland, Maine. Holdings consist of 36 acres, patented in 1872, and 1874, located in Sec. 28, T. 25 S., R. 33 E., M. D. M., about $\frac{1}{2}$ mile north of Kernville. Elevation, 2850 ft. There are three parallel veins, known as East, West and Middle, which have an average width of 40 feet, strike N. 30° E., dip 70 degrees west. These veins form what is locally known as the Big Blue-Summer lode. The pay shoot on west vein is said to have been 1400 feet in length, with an average width of 6 feet, and where this vein merged with the middle vein, it is stated that the lode was 80 feet in width between walls. The mine was developed to a depth of 400 feet. Workings caved and inaccessible. Idle.

Bibl.: VIII and XIV State Mineralogist Reports, VIII, p. 313; XIV, pp. 488-489, 511. Raymond, Seventh Report, U. S. Commissioner of Mining Statistics.

Blue Gouge Group of Mines, consists of 350 acres, located in Sec. 28 and 33, T. 25 S., R. 33 E., 2 miles north of Kernville. Elevation—3600 feet.

Owners: *Orcjuna Mining Company*, C. S. Long, president; C. C. Hamilton, secretary. Home office: Hayward, California.

Eight parallel veins occur on this group of claims in the granite, strike northeast and southwest, dip 68 degrees to northwest. Average width of these veins is from 4 to 5 feet. The Blue Gouge vein was developed by tunnel about 1000 feet in length, and shaft 200 feet in depth. Idle.

Bibl.: State Mineralogist Report XIV, p. 489.

Bull Run and Lady Belle Group consists of the following claims: Bull Run, Boston Belle, Jeff Davis and Lady Belle, located in Sec. 28, T. 25 S., R. 33 E., $\frac{1}{2}$ mile north of Kernville. Elevation 2980 feet.

Owners: *Lady Belle Mining Company*, of Portland, Maine. C. S. Long, manager, Hayward, California.

The Lady Belle-Bull Run vein occurs in the granite, and has an average width of 3 feet. Strike N. 75° E., dip 62 degrees north. The vein is cut by a fault striking north and south about 200 feet west of Lady Belle shaft. This fault evidently cut off the Lady Belle ore shoot to the southwest. The vein has been developed on the Lady Belle claim by a shaft 380 feet deep sunk on the vein. Four levels driven

east and west on the vein, amounting to several thousand feet, and three stopes 200 feet long. The ore shoot developed is reported to have been 250 feet long with an average width of 3 feet. The last operations conducted from the Lady Belle shaft was in 1914, when ore extracted from the 300 foot level is reported to have plated \$40 per ton. On the Bull Run claim, there is an incline shaft 360 feet deep, seven levels, several thousand feet of drifts and crosscuts, and one stope 900 feet long.

On the Jeff Davis claim, a vein of quartz twelve inches wide occurs in the granite, and is parallel to the Bull Run-Lady Belle vein. Strike N. 75° E., dip 70 to 75 degrees north. Workings consist of shaft 200 feet deep. It is reported that the ore shoot was 550 feet in length, and had an average width of 12 inches—stoped from 150 foot level to surface. Idle.

Bibl.: State Mineralogist Report, XIV, pp. 490, 498, and 501.

Commonwealth, owned by the *Kern Development Company*, C. S. Long, president; C. C. Hamilton, secretary. Offices: Portland, Maine. Consists of 32.4 acres, patented, in Sec. 15, T. 25 S., R. 33 E., about 2 miles north of Kernville. Prospect. Idle.

Bibl.: State Mineralogist Report, XIV, p. 491.

Nellie Dent and Content: consists of 54.3 acres, patented, in Sec. 28 and 33, T. 25 S., R. 33 E., about $\frac{1}{2}$ mile west of Kernville.

Elevation: 3000 feet.

Owners: *Kern Development Company* of Portland, Maine. C. S. Long, president and manager, Hayward, California; C. C. Hamilton, secretary, Kernville.

The vein is reported to be from 40 to 100 feet in width, between granite walls. Strike N. 30° E., dip 68 degrees west. Massive outcrop of quartz occurs on both the Content and Nellie Dent claims, which is about 50 feet in width. Workings on Nellie Dent claim consist of shaft 150 feet deep, in which it is reported that the shoot of ore worked was 450 feet long. Workings caved. Idle.

Bibl.: State Mineralogist Report, XIV, p. 505. Raymond, U. S. Commissioner of Mineral Statistics, 1875.

Zenda Mine, consists of 180 acres located in Sec. 30, T. 30 S., R. 33 E., M. D. M., in the Amalie Mining district, 14 miles northeast of Caliente, in the Sequoia Forest Reserve, at an elevation of 3000 to 3500 feet.

Owner: *Zenda Gold Mining Company*. Frank Counen, president; Arthur D. Storke, general manager; B. D. Abbott, superintendent. Offices, 120 Broadway, New York City.

Since the last report on the mine, contained in the XIV Report of the State Mineralogist, the property was acquired by the above mentioned company, in 1922, and operated from October, 1922, to April, 1923, when the mine suspended operations, pending the remodelling of the 150 ton cyanide plant. The new mill has been under continuous operation from August 1, 1923. The vein occurs as a massive outcrop of quartz in quartz-porphyry, strike northeast and southwest, dip 35 degrees north. The width varies from 30 to 50 feet, and where exposed

in the glory hole, it has a width of 50 feet. The known pay shoot is 300 feet in length, with an average width of 30 feet. Workings consist of a number of tunnels from 150 to 600 feet in length, and two glory holes. The ore is mined from a glory hole on top of the ridge, at an elevation of 3550 feet. At an elevation of 3000 feet, the main haulage tunnel is driven N. 30° W., about 350 feet, from which point an upraise connects with glory hole. The ore is trammed in four $1\frac{1}{2}$ ton cars from ore shoots to ore bins, at head of mill. The ore as mined from glory hole runs \$3.00 per ton, of which the values are .07 to .08 ozs. in gold, and 3.5 ozs. in silver. Mine equipment consists of Ingersoll Rand Imperial type (13" x 12") ($7\frac{1}{2}$ " x 12") compressor, driven by 60 h.p. motor, 60 h.p. electric hoist, air drills and blacksmith shop.

Mill: 150 ton ore bins, 10" x 20" Blake crusher, where ore is crushed to pass 1" ring, then to Hardinge ball mill in closed circuit with Dorr Simplex classifier, and ground to pass through 80 mesh. The pulp is then treated by Dorr decantation method. Cyanide plant consists of 10' x 40' solution tank, 5 Parral agitation tanks and 6 cyanide vats and three zinc boxes. The recovery made is said to be 85% of silver, and 99% of gold, 0.8 of pound of cyanide consumed per ton of ore, and 8 lbs. of lime per ton of ore. Electric power is secured from the Southern California Edison Company, and water is pumped from Caliente Creek, a distance of $\frac{1}{2}$ mile to plant.

Twenty-five men employed.

Los Angeles County.

COPPER AND GOLD.

Indicator Mine, formerly owned by the *Denver Mining and Milling Company* of San Fernando, has been recently acquired by J. W. Gates of Los Angeles. The property is located in Pacoima Canyon, 12 miles northeast of San Fernando. Elevation 2600 feet. The principal claims are known as: Denver, Chance, Fenner, Indicator and Red Ledge. There are a series of parallel quartz veins traversing a country rock of schist and gneiss, striking N. 80° E., dipping 60 to 80 degrees south. The veins vary in width from two to four feet. The ore is a complex sulphide, carrying massive pyrrhotite, chalcopyrite, galena, sphalerite, also stated to carry traces of nickel, cobalt and antimony, and said to carry values in gold and silver. These sulphides occur in lenticular masses in the different quartz veins.

Developments consist of a number of shallow shafts and tunnels on the different veins. Several men employed on development work.

Champion Group of Mines, consists of 15 claims, totaling 300 acres, in Sec. 28, T. 5 N., R. 14 E., in the San Fernando Mining District, about 4 miles northeast of Saugus, in the Santa Barbara Forest Reserve, at an elevation of 2000 feet.

Owners: S. B. Drum, 147 North Los Angeles Street, Los Angeles. Five veins; four parallel, have an average width of 4 feet, diorite foot-wall and porphyry hangingwall, strike east and west, dip 80 degrees south. There is one cross vein, having a width of 2 feet, which strikes north and south. The ore is oxidized gold quartz for a depth of 50 feet, where the sulphide zone is encountered.

Developments consist of a number of tunnels and prospect shafts on the different veins. The most extensive is on one of the east and west

veins; here a tunnel is driven 640 feet on the vein, and at 300 feet from portal cut ore shoot 80 feet long, average width of 3 feet, and ore is said to average \$11.00 in gold, per ton.

Winze sunk on ore shoot to depth of 30 feet, and drift driven 128 feet east on vein. There is another tunnel driven on No. 3 vein, 290 feet. On this group of claims, there is also a large blow out of white quartz, free from iron, that should be of some value on account of high silica content.

Equipment consists of cars, track and blacksmith shop. Idle.

CLAY.

Tropico Potteries, Inc., plant located at Tropico, has been recently acquired by *Gladding, McBean and Company* of San Francisco. The plant was formerly operated by the Pacific Minerals and Chemical Company, with L. Lindsey, president, but in 1920 was incorporated by B. M. Wotgas as the Tropico Potteries, Inc. The principal products manufactured by the company are architectural terra cotta, vitrified clay, sewer pipe, ornamental tile. The company owns clay deposits in Riverside and San Bernardino counties. The new owners are planning to increase the capacity of the present plant.

IRON AND STEEL.

Pacific Coke and Coal Company has recently been incorporated, capitalized at \$7,500,000, under the laws of Delaware, with \$2,500,000 in preferred, and \$50,000 shares of no par value common stock. The company is said to be a subsidiary of the Pacific Coast Steel Corporation, to take over the properties of the Pacific Coast Steel Company, with plants at San Francisco, Portland and Seattle. This corporation has acquired 230 acres of harbor land, lying between Long Beach and Los Angeles Harbor, and plans to erect the first unit of a blast furnace, capable of producing 600 tons of pig iron per day.

The company, besides owning coal and iron deposits in Utah, has also acquired the *Vulcan Iron Deposits*, located in the Providence Mountains, 4 miles east of Kelso, a station on the Salt Lake Railroad. The holdings, consisting of 260 acres, are in the southeast corner of T. 10 N., R. 13 E., San Bernardino County. The ore is a semi-hard red hematite, and is a replacement of limestone near its contact with monzonite. Average analysis of the iron ore is as follows: Iron, 64.82%; Phosphorus, 0.044%; silica, 3.04%; manganese, 6.278%; alumina, 0.568%; lime, 0.444%; sulphur, 0.059%; volatile, 1.85%. They have also acquired a large deposit of limestone near Victorville, San Bernardino County.

The officers of the Pacific Coke and Coal Company are: E. M. Wilson, president; T. F. C. Gregory, vice president; Wallace Sheehan, secretary.

Orange County.

Blue Light Mine. This property, which was formerly known as the Silverado Mine, is located on the west slope of the Santa Ana Mountains, in Silverado Canyon, 20 miles east of Orange, Secs. 11, 14, T. 5 S., R. 7 W. Elevation 2650 to 2950 feet. The property was discovered in 1894. Operated by the Western Zinc Mining Company from 1906 to 1908, who installed a mill and produced six cars of lead and zinc

concentrates. The property was idle until 1913 when acquired by W. H. Thorpe of Los Angeles, who installed 50 ton flotation plant, and operated the property until 1919. In 1919, the property was purchased by the *Blue Light Silver Mines Company*, Mr. Egabroad, president; C. S. Chapman, vice president and managing director; S. L. Collins, secretary; O. H. Pember, superintendent. Offices, F. & M. Building, Fullerton. The company have been developing the property to date. Claims: Dunlap-Blue Light, Harvey-Blue Light, Flannagan-Blue Light, Iron Clad No. 1, No. 2, No. 3, No. 4, Blue Light Extension No. 1, No. 2, No. 3, No. 4, and No. 5. Total holdings amount to 269 acres, of which 60 acres is patented.

The mineral belt in vicinity of Silverado Canyon is two miles wide, and extends nearly north and south for a distance of 8 miles. The country is formed to a great extent of dikes of greenish to blackish rocks, often showing distinct hornblende crystals. The mines south of the canyon are in a feldspathic rock, which is probably an intrusive porphyry. The crystalline rocks of this region are of the Cretaceous age. Two parallel lodes, known as Blue-Light lode and Dike vein, occur in the metamorphic rocks. The former having proved the most productive, has been extensively developed along its outcrop for a considerable distance. The veins have widths of 2 to 6 feet. The ore is silver bearing galena, associated with zinc-blende and pyrite. Irregular lenses of complex lead-zinc sulphide ore occur in these two lodes. Seven known ore bodies have been developed on the Blue Light lode, in the north and south workings from No. 3 tunnel on the Blue Light Mine.

The Blue Light vein strikes N. 16° E., dip 30 degrees to east, and has been proven on the surface for a distance of 4500 feet. Average width of vein being 4 feet. The vein has been developed by seven tunnels. At elevation of 3000 feet, No. 2 tunnel is driven on the vein 350 feet. No. 3 tunnel, which is 50 feet below No. 2 tunnel, is a crosscut tunnel for 200 feet to vein, then driven 470 feet south on vein, this tunnel is connected by upraises and stopes with No. 2 workings. No. 4 tunnel, which is located south of these workings, is a crosscut tunnel driven 900 feet east, cutting the vein at 540 feet from portal; no ore was found at this point and the vein was not drifted on either to the north or south.

The most recent development has been in driving No. 7 tunnel, which is located north of No. 3 workings and at a vertical elevation of about 400 feet below No. 3 workings, in Pine Canyon. The tunnel is driven 50 feet southwest, then crosscut 110 feet east to vein, with drift south 500 feet on the vein, with the expectation of developing the known ore shoots worked in upper workings. It is reported that 8000 tons of ore have been developed above No. 3 tunnel level that has an average value of .06 ozs. gold, 25 ozs. silver, 4% lead and 13% zinc.

Equipment: 14" x 8" x 8" Clayton compressor, driven by semi-Diesel Y-type gas engine, air drills, blacksmith shop, cars and track.

Mill: 50-ton flotation plant, two 9" x 15" Blake jaw crushers, driven by 30 h.p. West Coast gas engine, Challenge ore feeder, 5' x 4' ball mill in closed circuit with Dorr classifier, one 12' K. & K. flotation machine, two 6' K. & K. flotation machines, one Wilfley, one Overstrom and one

Cottrell table, two Dorr thickeners and one Denver filter, flotation plant driven by 100 h.p. Fairbanks-Morse semi-Diesel gas engine.

Product: produced in 50-ton flotation plant:

5 cars shipped in 1917 by W. H. Thorpe.

Lead concentrates:

Au. = 0.25 ozs.; Ag. = 303.8 ozs.; Pb. = 15%; Zn. = 14.4%; Fe. = 19.8%.

Zinc concentrates:

Au. = .08 ozs.; Ag. = 21 oz.; Pb. = 2.28%; Zn. = 45%; Fe. = 8.6%.

Iron concentrate:

Au. = .02 ozs.; Ag. = 4.3 ozs.; Zn. = 0.5%; Fe. = 43.5%; S. = 40%.

During 1922, shipped to Selby smelters: 52,280 lbs. of lead concentrates, assaying: Au. = 0.29 ozs.; Ag. = 207.20 ozs.; Pb. = 19.9%; Zn. = 31%; S. = 26.1%; Fe. = 6.2%.

29,120 lbs. of lead concentrates, assaying: Au. = 0.22 ozs.; Ag. = 104 ozs.; Pb. = 14.7%; Zn. = 21.7%; Fe. = 6.2%; S. = 21%.

Also produced a zinc product, assaying: Zn. = 45%, and carrying 30 ozs. silver, which was stored at plant, and a clean iron product, assaying: Au. = 0.02 ozs.; Ag. = 4.3 ozs.; Zn. = 0.5%; Fe. = 42%; S. = 40%, which was also stored at plant.

The company plans to increase the capacity of its present experimental flotation plant, as soon as the present plan of development work on No. 7 tunnel level is completed. Ten men are employed.

Riverside County.

CRUSHED ROCK.

Temescal Rock Quarry. The quarry was formerly owned by the *Temescal Rock Company*, now operated by the *Blue Diamond Materials Company*, 2200 E. 16th Street, Los Angeles.

The company's holdings cover 1100 acres of mountain land lying in T. 4 S., R. 6 W., S. B. M. The quarry is located in Temescal Canyon, 4 miles southeast of Corona. The material that is being crushed is a rhyolitic porphyry and is very hard and sharp. The mountain side where the rock is quarried slopes steeply, and has an elevation of 1000 to 1200 feet above the canyon. The bench now being quarried is approximately 350 feet high and 1200 feet long. The present production of the rock crushing plant is 5000 tons per day.

John Schreiner, manager; George Haines, superintendent.

Description of the crushing plant is contained in XVth Report of the State Mineralogist, pp. 586-587, and a more recent description is found in the *Engineering and Mining Journal Press*, November 24, 1923.

GOLD.

White Mines Corporation, John M. White, president. Offices: 440 Wilcox Building, Los Angeles, is developing a group of claims, located 35 miles north of Indio. The company owns six claims, on which it has a shaft 150 feet deep, and a tunnel driven on the vein 300 feet. The vein has an average width of 3 feet and is said to have an average value of \$12.00 per ton in gold. Three men employed.

TIN.

Temescal Tin Mine, located four miles southeast of Corona, on the old Spanish grant, known as the El Sobrante de San Jacinto, has recently been taken over under lease and bond by J. O. Stewart and associates of Los Angeles. The property was operated in 1887 by the *San Jacinto Tin Company*, an English corporation. The developments consisted of two incline shafts, 272 feet apart, located on Cajaleo Hill, which were sunk on a vein which strikes N. 45° E., dip 65 degrees northwest, and is said to have had an average width of 6 feet. A tunnel was driven on this vein which intersected one of these shafts at a depth of 45 feet, and the other shaft at a depth of 100 feet. A number of parallel veins occur in hornblende-biotite granite, having a general course of northeast and southwest. The belt in which these veins occur, carrying values in tin, is about 4 miles in length, and about 2 miles in width, the deposits being confined to the granitic rocks in this area. Two varieties of tin ore occur in the district. The yellow, occurring in thin layers in an uncrystalline form, and the brown oxide of tin.

The deposit is fully described in the XIth Report of the State Mineralogist, by H. W. Fairbanks, and also in the XVth Report, pp. 547-550, by F. J. H. Merrill.

MOLDING SAND.

Jurupa Molding Sand Deposit is situated in Sec. 29, T. 2 S., R. 5 W., on the Evans Ranch, about one quarter of a mile northwest of Jurupa Station on the Salt Lake Railroad, and on the south bank of the Santa Ana River, within the city limits of Riverside. The deposit is being developed by H. E. Blood, of 917 Citizens National Bank Building, Los Angeles, who has a lease on 20 acres.

The deposit is a fine-grained, sandy loam, and is from 6 to 20 feet thick, covering an area of 20 acres. It is stated that 90% of the sand will pass through 100 mesh screen.

Equipment consists of 18" belt conveyor, 20 feet long, and $\frac{1}{4}$ mesh shaking screen. About ten cars of screened sand is being shipped to Los Angeles. Two men are employed.

San Bernardino County.

CLAY.

Pacific Clay Deposit is located in Hart Mining District, which is situated in the extreme northeast corner of San Bernardino County, near the Nevada-California line. The deposit is being developed by the *Pacific Sanitary Manufacturing Company* of San Francisco.

GOLD.

Belmont Mine is located in the Goldstone Mining district, 34 miles N. E. of Barstow. Elevation, 3700 feet.

Owners: *Belmont Mining Company*, Dr. W. W. Ramsey, president; George I. Drumm, secretary; Morgan Berggreen, superintendent.

Holdings consist of 21 claims, totaling 240 acres. The present development work is confined to the Belmont group, consisting of five claims.

Two parallel quartz veins occur in shales and schist, strike N. 60° W., dip 35 degrees to northeast. These veins vary in width from 12 inches to 3 feet. The ore is free milling with some pyrite and chalcopyrite.

Developments consist of a number of shafts sunk to depths of 50 to 300 feet on the different veins. The main shaft is 300 feet deep, sunk on incline of 35 degrees. Drifts have been driven on the vein for a short distance on the 100', 200' and 300' levels. Present work confined to drifting on the vein on the 300 foot level; here the vein is 3 feet wide, and is said to average \$20.00 per ton. Some high grade ore was shipped from the property during 1916 and 1917.

Equipment consists of 15-h.p. Fairbanks-Morse gas engine hoist (7½" x 6"), Chicago pneumatic compressor, air drills, blacksmith shop and cars. The property adjoins the Goldstone Mining Company property, on the southeast. Three men employed.

Goldstone Mine is situated in the Goldstone Mining District, 33 miles northeast of Barstow. Elevation, 3600'.

Owners: *Goldstone Mining and Milling Company*, J. M. Schofield, president; G. Marston Leonard, secretary, Boston, Mass.

Holdings of the company consist of 22 claims, divided into five groups known as Goldstone, Golden State, Gold Dollar, Big Drum and Lucky Find. A vein of quartz occurs on the contact of crystalline limestone and shale. The vein has a course of north and south to northwest and southeast. Dip 40 degrees west. Average width of 4 feet. Ore shoot developed was 150 feet in length and 4 feet wide. Since XVth Report of the State Mineralogist, the company sunk a 2-compartment vertical shaft to depth of 300 feet, at 50 feet below the collar, cut the vein, and for the remaining distance the shaft is in the limestone footwall. No crosscuts were run to intersect the vein from this shaft. A number of incline shafts were sunk along the outcrop to depths of 40 feet, south of the main shaft. An open cut 150 feet in length was also made on the vein. Most of the ore mined came from this open cut. 100 tons of ore milled is said to have averaged \$40.00 per ton. One car of ore shipped by the company to Selby Smelter averaged \$70.00 per ton.

The property was operated from 1916 to 1918, when operations were suspended.

Equipment consists of 25-h.p. single drum gas engine hoist, 12" x 12" Fairbanks-Morse compressor, driven by 50-h.p. gas engine, headframe, blacksmith shop, assay office and buildings. Two men employed.

Bibl.: State Mineralogist Report XV, pp. 805-806.

Massen Group of Mines, consists of 87 claims, located on the northwest slope of the Alvord Range of mountains, in Sec. 26-35, T. 12 N., R. 3 E., 32 miles northeast of Barstow.

Elevation, 2400 to 3100 feet.

Owner: J. H. Massen and associates of Barstow.

A number of roughly parallel narrow quartz veins occur in the granite. These veins have a general course of northwest and southeast, with dips varying from 40 to 60 degrees to southwest. The veins vary in width from 2 inches to 2 feet. These narrow veins of quartz usually occur along fault fractures in the granite, and as a rule the fracture is filled with a diorite-porphry, with quartz occurring either

on the hanging or footwall of the fissure. The ore is oxidized quartz, showing free gold.

Developments consist of a number of shallow shafts and tunnels on the different veins. It is stated that ore shipped from the Gem State Group averaged \$50.00 per ton. Two men employed.

Olympus Mine, situated on the south slope of the Paradise Range of mountains, at elevation of 2400 feet, 22 miles north of Daggett.

Owner: *Olympus Gold Mining Company*, S. E. Bagley, president; M. W. H. Williams, secretary; H. Galerone, superintendent. Offices: 508 Alvarado Street, Redlands, California.

Since the data in XVIIth Report of the State Mineralogist was published, the company has been driving a crosscut tunnel to cut the vein at 200 feet below the collar of the incline shaft. At an elevation of 2200 feet, the tunnel has been driven 75 feet northwest, then 325 feet west to vein, with a drift north on the vein 100 feet. In this north drift, the vein has a width of $\frac{1}{2}$ feet. The vein filling being quartz and porphyry, which pans well in free gold. The company proposes to continue drifting on the vein until shoot of ore encountered in upper workings is developed. Four men are employed.

SILVER.

Rand District.

California Rand Silver, Inc. The company's report of operations for the year ending September 1, 1923, states that the outstanding feature of the mining enterprise today is the practical demonstration that the property can be operated with the market price of silver from 60 to 65 cents per oz. The company has been able to pay its regular monthly dividends of two cents a share, requiring a distribution of \$25,600, and has at the same time increased its surplus by \$135,000.

The original mill, with a capacity of 150 tons, was enlarged during the year to 400 tons capacity. For the year, there were 16,161 feet of underground development. Up to September 1, 1923, a total of 44,455 feet, or 8 miles of underground development work has been done since the opening of the mine. Aside from development work on other shafts, shaft No. 1 and No. 2 produced 134,000 tons of rock during the year, segregated as follows:

| | |
|--------------------|--------------|
| Shipping ore ----- | 8,830 tons |
| Milling ore ----- | 80,790 tons |
| Waste ----- | 44,380 tons |
| Total ----- | 134,000 tons |

Total Production.

Recapitulation of all production to August 1, 1923:

| From Ore— | Gold, ozs. | Silver, ozs. |
|---------------------------------------|------------|--------------|
| Prior to September 1, 1922----- | 10,084,253 | 4,232,241.73 |
| September 1, 1922–August 1, 1923----- | 1,625,658 | 923,563.35 |
| From Concentrates— | | |
| Prior to September 1, 1922----- | 1,176,853 | 363,695.44 |
| September 1, 1922–August 1, 1923----- | 5,147,982 | 1,471,451.97 |
| Grady Lease ----- | 5,429,989 | 1,487,742.11 |
| Totals ----- | 23,464,735 | 8,478,694.60 |

| <i>Values from Ore—</i> | <i>Gold</i> | <i>Silver</i> |
|--|----------------|----------------|
| Prior to September 1, 1922 ----- | \$4,602,650.17 | \$3,312,908.33 |
| September 1, 1922–August 1, 1923 ----- | 927,652.88 | 689,357.14 |
| <i>Values from Concentrates—</i> | | |
| Prior to September, 1922 ----- | 388,020.99 | 323,086.75 |
| September 1, 1922–August 1, 1923 ----- | 1,412,126.87 | 1,192,587.70 |
| Grady Lease ----- | 1,599,979.98 | 1,099,119.70 |
| Totals ----- | \$8,930,430.89 | \$6,617,059.62 |

The mill has treated 90,363 tons of ore in 332 days, which is an average of 272.17 per day. There were $27\frac{1}{2}$ days lost time, of which 50 per cent was due to delays, such as water shortage, ore shortage, or power interruptions. The running time efficiency was 91.72 per cent. The running time tonnage averages 296.75 tons per day.

The average gold heads were \$1.93; average gold tails were \$0.528; average gold extraction was 72.64 per cent. The average silver heads were \$15.00; average silver extraction was 90 per cent. The total average heads was \$16.93; total average tails were \$2.02; total average extraction was 88.50 per cent. The recovery per ton was \$14.91; total recovery on 90,363 tons, \$1,347,312.33; average concentrate value was \$307.29; tons of concentrates shipped 4,595.414; gross value of concentrates shipped \$1,412,126.87; net value of concentrates shipped, \$1,192,587.70. Cost of marketing 4,595.414 tons of concentrates was \$219,539.17, or \$47.77 per ton.

After payment of the dividends of September 4, 1922, the company had on hand a balance of \$319,200.

Revenue from the smelter for ore and concentrates for the year was \$1,881,944.84, to which is added bullion sold, interest earned, and sundry receipts, totaling \$17,624.87, making a total revenue of \$1,899,569.71.

Principal items of disbursement were:

| | |
|--|----------------------|
| Labor ----- | \$517,909.90 |
| Materials, supplies, power development, litigation, insurance and incidentals ----- | 484,128.54 |
| Taxes ----- | 147,268.60 |
| | <hr/> \$1,149,307.04 |

The company paid in dividends to stockholders, including the September, 1923, dividend, \$819,200 and had on hand September 4, 1923, a balance of \$589,841.28, an increase of \$270,641 over the balance at this time last year.

In the four years and two months of operation of the mine, there have been distributed in dividends as follows:

An initial dividend of $7\frac{1}{2}$ cents per share, forty-four regular dividends at two cents per share, and eleven extra dividends at 10 cents per share, making a total of \$2.05 $\frac{1}{2}$ per share or \$2,630,400.

San Diego County.

GEMS.

Himalaya Gem Mine, located in Sec. 17, T. 11 S., R. 2 E., near Mesa Grande, is being operated by Fred Rynerson of San Diego. The property was formerly operated by the *Himalaya Mining Company* of

New York. A pegmatite dike having a general north-western direction, occurs in a dark green gabbro. The average width of dike is about 4 feet. The tourmaline and other gem material occur imbedded in clay, in cavities and pockets in the coarse pegmatite dike. A new tunnel is being driven to cut the vein at a greater depth that was attained in the old workings and the present operator expects to open up important deposits of gem tourmaline with this deeper development.

A. B. C. Gem Mine, located in Sec. 8, T. 13 S., R. 2 E., near Ramona, is being developed by C. A. Seay, and L. B. Spalding of Ramona. It is reported that some new pink beryl deposits have been encountered. The gem material occurs in pegmatite dikes in granite. The mine has been worked at intervals since 1907, and is reported to have produced a large amount of pink beryl. The largest production came from what is known as the old Daggett stope, a narrow, irregular working, which followed the vein on its dip for something over 100 feet. Recently, a new shoot of gem-bearing clay has been found north of the Daggett stope.

GOLD.

North Star Mines, located in Sec. 31, T. 14 S., R. 5 E., in Deer Park Mining district, 7 miles northeast of Descanso, was recently purchased by Francis Gage and associates of Los Angeles, from J. H. Schook of Descanso. It is reported that the new owners will start active development work on the property, and also plan to install a 5-stamp mill. The ore is stated to have an average value of \$25.00 per ton.

NICKEL.

Friday Copper Mine, consists of the following claims: Sterne, Copper Queen, Uncle Sam, Cobalt King, and Nickel King, located in Sec. 15, T. 13 S., R. 4 E., 4 miles south of Julian.

Elevation: 4400 feet.

Owner: *Friday Copper Mining Company*, Frank H. Brown, president; Beecher Stern, secretary. Offices, American National Bank Building, San Diego.

The property has recently been taken over under lease and bond by Allen R. Partridge of Los Angeles.

On the surface, the outcrop of the vein is an iron gossan, consisting chiefly of limonite, striking east and west, with a width of 25 to 50 feet. The ore occurs near the contact of gabbro and schist and in places is enclosed in gabbro. The ore consists mainly of pyrrhotite, but contains pyrite, and an iron nickel sulphide, and is accompanied by small quantities of amphibole and calcite. Analysis of ore shows 4% nickel, 2% cobalt, and 6% arsenic.

Developments consist of shaft 175 feet deep, with two levels, one at a depth of 130 feet, the other at a depth of 175 feet. The ore body developed is 60 feet long by 20 feet in width.

The mine is being unwatered, and an extensive plan of development has been planned. Joseph Hartley, superintendent.

OIL FIELD DEVELOPMENT OPERATIONS.

By R. D. BUSH, State Oil and Gas Supervisor.

FEATURES OF 1923 PRODUCTION.

California again broke all previous records in its production of petroleum by producing 263,729,000 barrels in 1923. This is about 36 per cent of the amount produced in the entire United States, and almost double the amount produced by California in 1922, which was a record year. This great increase was due to the intensive and rapid development of the Huntington Beach, Santa Fe Springs and Long Beach fields, where initial productions of nearly all the wells were large. These three fields produced 69.4 per cent of the State's production in 1923. This tremendous production taxed the storage capacity and marketing facilities of the large companies, and caused new markets for California crude oil to be opened. About 92,000,000 barrels of crude was in storage at the end of 1923, as compared with 61,380,000 barrels at the beginning of the year, and notwithstanding about 54,455,000 barrels was shipped through the Panama Canal to eastern refineries.

During September, 1923, production reached its maximum, and then declined, this decline continuing to the end of the year, in spite of the fact that production was resumed in some of the San Joaquin Valley fields where it had been shut in. In December, 1923, for the first time since December, 1920, storage decreased, or, in other words, consumption, which includes oil shipped to eastern ports through the Panama Canal, was greater than the December production, which averaged daily 706,000 barrels. The indicated consumption of oil increased during the year from 451,613 barrels in December, 1922, to 711,459 barrels in December, 1923.

There were three reductions in the price of oil in 1923: the first reduction was made on January 6, when all grades, including 20 degrees Baumé, and above, were reduced, the highest gravity (35 degrees and above) being reduced 53 cents. The next reduction, on April 10, for the refinable oils, amounted to 41 cents for the highest grade. The third reduction, amounting to 18 cents on the highest grade, was made on October 9. Fuel oil, or the grades below 20 degrees Baumé, remained stationary during the year.

A total of 1400 new wells was started in 1923, as compared with 1439 in 1922. During the year, 980 producing wells were completed.

At the close of the year with the Santa Fe Springs, Huntington Beach and Long Beach fields almost completely developed, activity in the Los Angeles Basin centered in Torrance field, but this field does not give promise of being as prolific, or of developing as rapidly, as the above mentioned fields, since most of the acreage is held in comparatively large leases by the larger companies. Activity is also gradually increasing in the older fields of the San Joaquin Valley, and the outlook for the petroleum industry for the year 1924 looks bright at the present time. The year started out with an increase in the price of all grades of oil amounting to 25 cents, effective January 22, and the prospect of additional increases during the year is good.

From September 8, 1923, to and including December 29, 1923, the following new wells were reported as ready to drill:

ADMINISTRATIVE DIVISION.

WALTER W. BRADLEY, Deputy State Mineralogist.

New Publications.

During the period covered by this issue (September 15, 1923-January 15, 1924), the following Bureau publications have been made available for distribution:

Bulletin No. 93, "California Mineral Production for 1922," by Walter W. Bradley. For free distribution.

Summary of Operations, California Oil Fields, Vol. 8, No. 12, June, 1923; Vol. 9, Nos. 1, 2, and 3, July, August, and September, 1923, respectively.

Mining in California, September, 1923, Vol. 19, No. 4.

Commercial Mineral Notes: Nos. 6 to 9 (inc.), September to December, respectively.

As the timeliness of publication is important in the case of the lists of 'mineral deposits wanted' and 'minerals for sale,' this information is issued in the form of a mimeographed sheet once a month since the change to a quarterly status of 'Mining in California.' This list is mailed, free of charge, to those on the mailing list for the quarterly.

In connection with the monthly 'Commercial Mineral Notes,' it has been gratifying to receive the many congratulatory letters and statements telling of its value and the practical results obtained from it. We have been informed of actual business and of sales directly traceable to the data thus disseminated.

Mails and Files.

The Bureau maintains, in addition to its correspondence file, a mine report file which includes reports on some 7500 mines and mineral properties in California. Also there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the period of July 1, 1923, to January 15, 1924, there were 3750 letters received and answered at the San Francisco office alone, covering almost every conceivable phase of prospecting, mining and developing mineral deposits, reduction problems, and marketing of refined products.

DIVISION OF MINERALS AND STATISTICS.

Statistics, Museum, Laboratory.

WALTER W. BRADLEY, Deputy State Mineralogist.

STATISTICS.

Estimate of 1923 Output.

The total value of the mineral production of California for the year 1923 is conservatively estimated to have been approximately \$270,472,000. This is, in part, detailed in the tabulation below; but, as there are more than fifty mineral substances on California's commercial list, it is impractical at this early date to obtain anything approaching definite figures on other than the more important items. The blank report forms are being mailed out to the operators in all mineral lines, and the date of publication of the final and complete report will depend upon the promptness of their replies. The State Mining Bureau urges the hearty cooperation of all concerned, to the end that the results may be made known early.

This estimated total of \$270,472,000 is an increase of over \$25,000,000 above the 1922 production and surpasses by more than \$2,000,000 the previous record value of \$268,157,472 of the year 1921. This increase in value is due principally to petroleum, which shows a new record quantity for 1923, which is nearly double the previous record figure of the year 1922 in number of barrels. Even with the resultant lower prices prevailing, it is estimated that the 1923 petroleum yield will show an increase of approximately \$22,000,000 in total value over that of 1922.

Though reports from a number of the gold mining districts have been indicative of renewed interest and renewing operations, receipts of bullion at the mint and smelters show a decrease for the year. Apparently some of the larger lode mines have not operated to their full capacity. There has been considerable activity in the Alleghany district, Sierra County, and in the Grass Valley district, Nevada county. Smelter reports give increased quantities for copper and lead, and as a consequence a larger amount of silver, though the last named will show a lessened total value owing to cessation after June of \$1 per ounce purchases by the Government under the Pittman Act.

As the demand for building materials continued active during 1923, nearly all items of the structural group will show increased quantities and total values, especially cement, brick, hollow building tile, crushed rock, sand and gravel. Magnesite shipments increased about 25 per cent. The demand for this material for stucco and other plastic purposes is showing a healthy growth. There were no notable changes in the general status of the miscellaneous 'industrial' group, nor among the salines, except pottery clays and borax. Demand for architectural terra cotta and tile has caused increased shipments of pottery clays of all grades. Reports from the borax producers indicate a 50 per cent increase in borate minerals for 1923.

The estimated quantities and values for 1923 are tabulated as follows:

| | |
|---------------|--|
| \$13,250,000 | gold. |
| 2,771,000 | (3,400,000 fine oz.) silver. |
| 3,942,000 | (27,000,000 lb.) copper. |
| 605,000 | (8,400,000 lb.) lead. |
| 20,000 | iron and manganese ores. |
| 409,000 | (6,200 flasks) quicksilver. |
| 100,000 | (800 fine oz.) platinum. |
| 195,000,000 | (262,000,000 bbl.) petroleum. |
| 7,475,000 | (115,000,000 M. cu. ft.) natural gas. |
| 17,000,000 | (10,000,000 bbl.) cement. |
| 12,000,000 | crushed rock, sand and gravel. |
| 9,000,000 | brick and hollow building tile. |
| 840,000 | (70,000 tons) magnesite. |
| 1,500,000 | other structural materials, including granite, lime, marble et al. |
| 3,000,000 | miscellaneous 'industrial' minerals (including asbestos, barytes, pottery clays, dolomite, feldspar, gems, graphite, diatomaceous earth, limestone, lithia, mineral water, shale oil, silica, talc, et al.). |
| 3,560,000 | salines (including borates, calcium and magnesium chlorides, potash, salt, soda). |
| <hr/> | |
| \$270,472,000 | total value. |

MUSEUM.

The Museum of the State Mining Bureau possesses an exceptionally fine collection of rocks and minerals of both economic and academic value. It ranks among the first five of such collections in North America; and contains not only specimens of most of the known minerals found in California, but much valuable and interesting material from other states and foreign countries as well.

Mineral specimens suitable for exhibit purposes are solicited, and their donation will be appreciated by the State Mining Bureau as well as by those who utilize the facilities of the collection.

The exhibit is daily visited by engineers, students, business men, and prospectors, as well as tourists and mere sightseers. Besides its practical use in the economic development of California's mineral resources, the collection is a most valuable educational asset to the State and to San Francisco.

LABORATORY.

FRANK SANBORN, Mineral Technologist.

The State Mining Bureau since its organization has supplied the necessary identification of minerals, without cost, to thousands of individuals, and has been largely instrumental in bringing to light those of commercial importance in California.

At irregular intervals new uses are found for minerals; as a result, the market for the particular mineral is stimulated or created, and the prospector adds a new name to his list of commercial products.

Recently the aluminum silicates sillimanite, andalusite, and cyanite have been in demand. These minerals are not easily identified in the

field, therefore prospectors who have made inquiry at this Bureau for a description of the silicates have been supplied with small samples. Counties in which some or all of these minerals are known to occur are: Mono, Riverside, Inyo, Imperial, and San Bernardino.

During the four months' period, September 15, 1923, to January 15, 1924, 1223 samples were received and determined at the laboratory.

LIBRARY.

FOREST L. CAMPBELL, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the State are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

OFFICIAL PUBLICATIONS RECEIVED.

Governmental.

U. S. Geological Survey:

Annual Report, 44th, of the Director to the Secretary of the Interior for the fiscal year ending June 30, 1923.

Bulletin No. 78—The Twentymile Park District of the Yampa Coal Field, Routt Co., Colorado. By Marius R. Campbell.

Bulletin No. 755-A—The Alaskan Mining Industry in 1922. By Alfred H. Brooks and Stephen R. Capps.

Bulletin No. 755-B—The Metalliferous Deposits of Chitina Valley, Alaska. By Fred H. Moffit.

Bulletin No. 760-A—Pedestal Rocks in the Arid Southwest. By Kirk Bryan.

Bulletin No. 749—Geology of the Tullock Coal Field. By G. S. Rogers.

Prof. Paper No. 132-B—A New Fauna from the Colorado Group of Southern Montana. By John B. Reeside, Jr.

Prof. Paper No. 133—The Correlation of the Vicksburg Group. By C. Wythe Cooke; and The Foraminifera of the Vicksburg Group. By Joseph A. Cushman.

Prof. Paper No. 132-C—Notes on the Geology of Green River Valley between Green River, Wyoming, and Green River, Utah.

Water Supply Paper No. 527—Surface Water Supply of the United States, 1921. Part VII. Lower Mississippi River Basin. By Nathan C. Grover.

Water Supply Paper No. 520-A—A Variation in Annual Run-off in the Rocky Mountain Region. By Robt. Follansbee.

Water Supply Paper No. 528—Surface Water Supply of the United States, 1921. Part VIII. Western Gulf of Mexico Basin.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of buyers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them, have been made known to those looking for raw mineral products.

Since the publication of MINING IN CALIFORNIA was begun, current inquiries from buyers and sellers have been summarized and lists of mineral products or deposits 'wanted' or 'for sale' included in each issue.

It is important that inquiries of this nature reach the mining public as soon as possible and in order to avoid the delay incident to their quarterly publication in MINING IN CALIFORNIA, these lists are now issued monthly in the form of a mimeographed sheet under the title of 'Commercial Mineral Notes.'

EMPLOYMENT SERVICE.

Following the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau registers technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of current applications for positions and 'positions open' is carried in each issue. Notices are designated by a key number, and the name and address corresponding to any number will be supplied upon request, without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss. Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 21-1 Engineering. Nine years' experience mining, power companies and public works. Can handle office work also. Age 30; married; references; salary wanted, \$200.
- 21-2 Engineering. Mechanical Dept.; four years' experience general construction engineering. Age 30; single; references; salary open.
- 21-3 Assistant Geologist or Engineer, Oil and Gas. One year's experience; four years in U. S. Army (Regular). Age 32; single; references; salary open.
- 21-4 Engineering, mining or geological. Two and one-half years' experience. Age 24; single; references; salary open.
- 21-5 Mine Superintendent or Foreman. Thirteen years' experience. Age 42; widower; references; salary wanted, \$200, minimum.
- 21-6 Superintendent or Foreman of Gravel Mine. Twenty-five years' experience in drift and hydraulic mining. Age 45; married; references; salary wanted, \$200.
- 21-7 Mining Engineer. Technical graduate. Seven years' experience. South Africa, Michigan and Minnesota. Age 30; married; references; salary open.
- 21-8 Assayer or Analyst. Six and one-half years' experience. Age 30; married; references; salary wanted, \$180.
- 21-9 Assayer or Mill Work. Junior student. Six months' experience. Age 30; married; references; salary open.
- 21-10 Mining Engineer. Twenty years' experience development, operation and examination of mines. Age 44; married; references; salary open.
- 21-11 Surgeon for Mining Company. Four years' chief surgeon at copper mine, Arizona. References.
- 21-12 Consultant on Diatomaceous Earth. Ten years' experience, asbestos and diatomite manufacture. Age 45; married; references.
- 21-13 Engineer or Superintendent. Thirteen years' general experience. Age 41; married; references; salary wanted, \$250.
- 21-14 Engineer, Superintendent or Manager. Twenty years' general experience. Age 42; married; references; salary open.

- 21-15 Mine Superintendent and Assayer. Experience covers operation and examination work. Age 48; married; references; salary wanted, \$250.
- 21-16 Draftsman (architectural). Seven and one-half years' experience, including railway construction. Age 30; married; references; salary wanted, \$150.
- 21-17 Hoist Engineer, Electrician, Mechanic, Millman. Sixteen years' varied experience, mainly California and Mexico, in mine, power-house and mill. Age 50; married; excellent references; salary open.
- 21-18 Mine foreman (coal) or fire boss. Thirty years' experience; thirteen as boss or fire boss. Has fire boss and mine boss certificates. Age 46; single; references; salary open.

PUBLICATIONS OF THE CALIFORNIA STATE
MINING BUREAU.

During the past forty-four years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield, and Sacramento. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

REPORTS.

Asterisks (**) indicate the publication is out of print.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the state may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the state. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

THE STATE MINING BUREAU
CORDIALLY INVITES YOU TO VISIT
ITS VARIOUS DEPARTMENTS MAINTAINED
FOR THE PURPOSE OF FURTHERING
THE DEVELOPMENT OF THE
**MINERAL RESOURCES OF CALI-
FORNIA**

At the service of the public are the scientific reference library and reading room, the general information bureau, the laboratory for the free determination of mineral samples found in the state, and the largest museum of mineral specimens on the Pacific Coast. The time and attention of the State Mineralogist, as well as that of his technical staff, is also at your disposal.

Office hours: 9 a.m. to 5 p.m. daily.

Saturday, 9 a.m. to 12 m.

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922, and continued until March, 1923.

Owing to a lack of funds for printing, quarterly publication was begun in September, 1923.

For the same reason, beginning with the January, 1924, issue, it has been necessary to charge a subscription price of \$1 per calendar year, payable in advance; single copies, 25 cents apiece. 'Mining in California' will continue to be sent without charge to our exchange list, including schools and public libraries, as are also other publications of the State Mining Bureau.

Pages are numbered consecutively throughout the year and an index to the complete reports is included annually in the closing number.

Such a publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff and other contributors are included. Mineral production reports formerly issued only as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance also are reported.

While current activities of all descriptions will be covered in these chapters, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added in the future as they are completed.

The chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful, latent resources of the State of California.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each district working out from field offices that were established in Redding, Auburn, San Francisco and Los Angeles, respectively.

This move brought the Bureau into closer personal contact with operators, and it has many advantages over former methods of conducting field work.

To continue this system most effectively with the limited funds available for the present biennium, the Redding and Auburn field offices were consolidated and moved to Sacramento on June 1, 1923.

The boundaries of each district were adjusted and the counties now included in each of the three divisions, and the locations of the branch offices, are shown on the accompanying outline map of the state. (Frontispiece.)

Reports of mining activities and development in each division, prepared by the district engineer, will continue to appear under the proper field division heading.

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the state's oil fields is included under this heading.

SACRAMENTO FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

Amador County.

A. L. Chappell is in charge of work at the *Cleveland Consolidated Gravel Mine* near Volcano. A new prospect shaft had reached a depth of about 60 feet by the middle of March. The mine has been a producer.

Elephant Hydraulic Mine near Volcano was prepared for operation in the fall with three giants placed and three ditches ready to deliver water, but it had been impossible to do any work up to the middle of March on account of shortage of water. Grillo Brothers and John Baroni are the lessees.

Ludekins Hydraulic Mine, beside the highway between Volcano and Barnhart station, has been able to operate with one giant in a small way, two men being employed.

Marklee Mining Company, 105 Federal Realty Building, Oakland, Cal. This company had cleaned out the first 230 feet of the old main shaft of the *Marklee Mine* and had done a good deal of work on the surface up to the middle of March, at which time they had suspended work. It is reported that over \$18,000 had been spent.

The main shaft, in which the rich shoot of early days was found, is about 500 feet deep. The strike of the vein is north of west and the ore-shoot is said to have raked away from the shaft, necessitating longer drives on each succeeding level. The mine was discovered in 1868 and, according to a report by the original owners in 1869, was 100 feet deep

the autumn of that year and was producing ore of an assay value of \$60 a ton, from which only \$30 a ton was recovered, on account of lack of facilities for saving sulphides. While the lapse of time has been so great that definite details are hard to get, it seems certain that the main oreshoot was quite short and that the bottom level had not been run far enough to prove the shoot, although a body of \$4 ore is said to have been found on that level. Besides the main shaft, a drift was run from near the shaft collar for about 800 feet along the vein, and three winzes were sunk to depths of 350, 100 and 140 feet respectively. There is said to be about 200 feet of blank ground on the vein between the two oreshoots, the second of which is said to have been penetrated by the farthestmost winze, and is said to be about a foot wide. The mine is about five miles from Volcano. It is equipped with a 10-stamp mill, boiler and steam engines and small lumber sawing plant.

Moore Minc. Moore Mining Company, main office 923 Balboa Building, San Francisco. The 800 station had just been finished and drifting for the shoot had begun on March 13th. The oreshoot was reported 300 feet long on the 640 level and was stoped for an average width of nine or ten feet. There was a sharp bend in the shoot where it was worked 16 feet wide. This level has been about worked out.

According to a statement issued to stockholders on February 19, the total cost of the plant to that date had been \$106,502.86. The mill building and machinery (20 stamps with concentrators) cost \$50,584.41; hoist \$6,996; tailing dam \$6,672, and miscellaneous plant items \$19,147.83. A total of \$61,740 has been paid on account of purchase of property.

During January and February, 1924, only ten stamps of the mill were operated and averaged 46 tons each twenty-four hours. For this two months period the gross production was \$20,243.83. The average recovery in February was 80 per cent. During 1923 a great deal of trouble was experienced in making the actual recovery from the mill check anywhere near the indicated recovery. For December, actual recovery was said to have been \$7.252 less than indicated recovery, for November \$1,590 less, for October \$4,002 less and so on, in spite of all possible precautions in sampling and assaying. The ore is said to carry orpiment, and this mineral and galena are said to be causing the principal loss in the slimes.

Old Eureka Mine at Sutter Creek was reported sold the middle of April to the Central Eureka Mining Company. The Central Eureka Company had lately been mining good ore on and near their north end line, and the sale, if made, will set at rest any speculations about possible litigation.

Pitts Mine (Mountain King and Mountain Queen) is nine miles by road from Jackson, and adjoining the village of Pine Grove, in section 4, T. 6 N., R. 12 E., containing 110 acres in all. Owners are W. B. Pitts and Mrs. Louise Pitts. A lease and option to purchase is held by A. M. Locey, W. L. Erwin, Mrs. Alva Archer and H. C. Kennedy.

There are two series of veins and rich ore has been found near their intersections. On an easterly striking vein a shaft has been sunk 265

feet with a level at 250 feet but there is no record of production from it though some good prospects were reported in sinking. About 150 feet north of this, a northerly striking vein comes in from the south up to the first fissure, and the Anaconda shaft was sunk 125 feet on this second vein near the intersection. This vein is said to have yielded a good gold production under romantic circumstances, but there is no written record. A tunnel was run from the creek 70 feet lower than the shaft collar, northward for several hundred feet with two forks and high-grade ore was found in both directions, on the north in a winze that has been started lately by the lessees and in an old raise put up by other operators. The veins in this part of the property range from one to six feet wide. Another vein, 250 feet north of the deeper shaft, appears to cut off the east striking vein. The operators are prospecting the tunnel workings and plan to put up a five-stamp mill, believing they have considerable ore available. There are other veins on the property that have not been developed. The geological indications in the tunnel workings are promising, but it is evident that most of the work done heretofore has been in search of pockets and no attempt has been made to develop milling ore. The richer ore shows gold in galena.

In the Defender District, which is opposite the West Point District of Calaveras County, little work is going on. The two are a unit geologically.

Amador Columbus Mine is opposite the Columbus Mine and supposed to be an extension of it. Frank de Bois is sinking a prospect shaft and is down about 40 feet.

R. C. Reed of Volcano has leased the *Defender Mine* from the owner, J. B. Stapler of West Point. Reed has been working alone and has driven about 50 feet of tunnel and has sunk 50 feet of winze on what is called the west ledge. The quartz in this winze is about 6 feet wide, with hard walls and no gouge, the footwall being poorly defined. What appears to be a dike has been slightly exposed on the hanging wall. A few tons of ore milled from this winze is reported to have yielded very satisfactorily.

The Defender vein is the middle one of three veins and the only one on which much has been done previous to Reed's work. There is reported to be in the bottom workings, 480 feet deep, a body of ore very heavy with pyrite, that carries \$10 to \$12 a ton and offers a treatment problem as the sulphide content is already too high to make concentration feasible. The ore was very good to a depth of 360 feet.

Piney Creek Mine, a mile northeast of Barnhart station, is being operated by Frank Shafter, who is installing a roller mill.

Sunset Mine. John J. Ratto of Sutter Creek and C. R. Daggett of Ione have been producing some very good ore from the 300-foot level of this mine, which is a mile and a half west of Martel.

The deposit of red marble on the *Wait Ranch*, near Plymouth, is being prospected by the California Slimes Company, W. E. Darrow, president. This deposit shows an outcrop 160 feet by 400 feet, as mentioned in our 1923 report, but has not been previously prospected.

Calaveras County.

Columbus Mine was productive in 1922 and 1923 and was sold by W. W. Gibson after he realized a good profit from ore milled.

Forest Creek Mining Company. Richard Hedrich, Jr., general manager, West Point. This property is six miles from West Point and has been prospected for several years past. It is at present being equipped with considerable machinery.

Lone Star Mine. J. B. Stapler and Company, West Point. This property was productive during 1923, the ore reported as coming from a winze below the 'minus 200' level. A small mill was in operation.

Porteous Group of claims on the Licking Fork above West Point is being developed by Frank Becker. Ninety feet of new tunnel has been run recently by Becker with four men employed. Water from the Licking Fork is used to develop power for the compressor.

Woodhouse Mine is being reopened by W. W. Gibson. It is in the West Point District.

Lamphear Mine, south of Mokelumne Hill, is the basis of a new company called the Lamphear Mining Company, with an office at Mokelumne Hill. Myron D. Greve, Mokelumne Hill, is secretary of the company. The capitalization is 200,000 shares at fifteen cents each.

The Lamphear Mine was worked as early as 1867, when it had an 8-stamp mill as stated by J. Ross Browne in a report written in 1868, at which time a depth of 45 feet had been reached. According to a map by J. Robert Wylie there are two shafts on the property, the deeper about 300 feet deep with levels at 100, 180 and 280 feet, and the other 100 feet deep. The two were connected on the 100 level and the 180 level is run nearly to the second shaft which is 200 feet southeast of the first. The 280 level was drifted about 90 feet. The vein has been stoped from the 180 level to the surface. It strikes northwest and dips northeast and is reported four to eight feet wide, including gouge. While no rich assays are being claimed, the promoters of the company believe the geological conditions favorable. The mine has been unwatered and some work is being done.

Activity has continued at the *Apex Mine* (Ford) at San Andreas, where the levels below the 100 level were being unwatered at last report.

Prosperity Mine, J. Robt. Wylie, manager, is being prepared to start milling some ore. Wylie reports very encouraging assays.

COPPER.

Calaveras Copper Company. Eastern office, Oliver Ames, president, Ames Building, Boston, Mass.; C. H. Tyler, managing director and secretary; S. M. Levy, general manager, Copperopolis, Cal. The mine, concentrator and smelting plant are at Copperopolis. The extent of the property and notes on the past operations are shown in Report XIII of the State Mineralogist. The mines now consolidated under this company are among the oldest copper producers in the state, the Union, Empire and Keystone claims having been opened in 1861. Between

1861 and 1869 the properties have a record of having shipped 125,739 tons of ore assaying 10 per cent copper or better, the Union and Keystone having been during that period the principal copper producers of the state. They were closed down from 1869 to 1887, in which year underground work was resumed and continued until 1892, a 100-ton smelting furnace having been put up in 1889. The Calaveras Copper Company operated from 1909 to 1913, then again during the war period, after which the property has been under development and improvement in a small way, awaiting an increase in the price of copper, until the past year when mining and smelting were resumed. During 1923 the production was 1,436,326 pounds of copper and only 1464 ounces of silver, with no gold.

The property is being worked now through the Discovery or Keystone shaft, the collar of which is 984 feet above sea level. This shaft is 1150 feet deep on the dip of vein, which averages 61 degrees. The Union shaft is 1500 feet south of it and still further south is the South shaft, 500 feet deep, which has a hoist and is available as a second exit, being connected with the old eighth level of Discovery shaft. Former operations were through the Union shaft. At present, work is going on from the three lowest levels of Keystone shaft, No. 11 level being open 1160 feet south, No. 12 level 850 feet south and the 1350 level 650 feet south. At the time of visit (February 20) ore was being stoped from the 1100 and 1350-foot levels.

The main orebody is reported 600 feet long with an average width of 15 feet. On the 1350 level they also have a footwall orebody about 200 feet long and ten feet wide, not cut previously on the other levels and which later may be found to connect with the main body, though now distinct. The orebody is worked out above the ninth level which is about 450 feet on dip above 1350 level. The ore lies in lenses, with only an occasional break on the dip, but overlapping on the strike. The flat slips have a maximum throw of 40 feet. The ore is chalcopyrite with more or less pyrite, and is deposited typically along seams in black Mariposa slate, along the direction of strike of the bedding planes of the slate, or northwest. On the footwall of the slate is serpentine with lenses of talc. On the hanging wall on the 1350 level is a grey-green amphibolite schist, although the hanging wall is stated to have been meta-diorite in the upper levels, the gradation between the two probably being gradual. On the 1350 level where noted, the separation between the grey schist and the black slate appears gradual and indistinct, and sulphides occur in both. A granodiorite dike is reported to come up in the slate in the form of a lens, with a maximum thickness of 40 to 50 feet, and smaller dikes have been noted. The ore is reported now to be averaging about 4 per cent copper, carries no gold as far as smelter returns show, and very little silver. The main dike carries at times as much as $1\frac{1}{2}$ per cent copper. Stopes are filled and little timber is used except for chutes and drifts. In the drifts, when near serpentine, large caps are soon buckled by the heavy side pressure, while the posts take little weight. Some bunches of very rich ore are encountered, composed of chalcopyrite carrying up to 20 per cent copper, and the other copper minerals are notably lacking, the deposit being different in this respect and in the lack of precious metals from any others now or recently operated in the state.

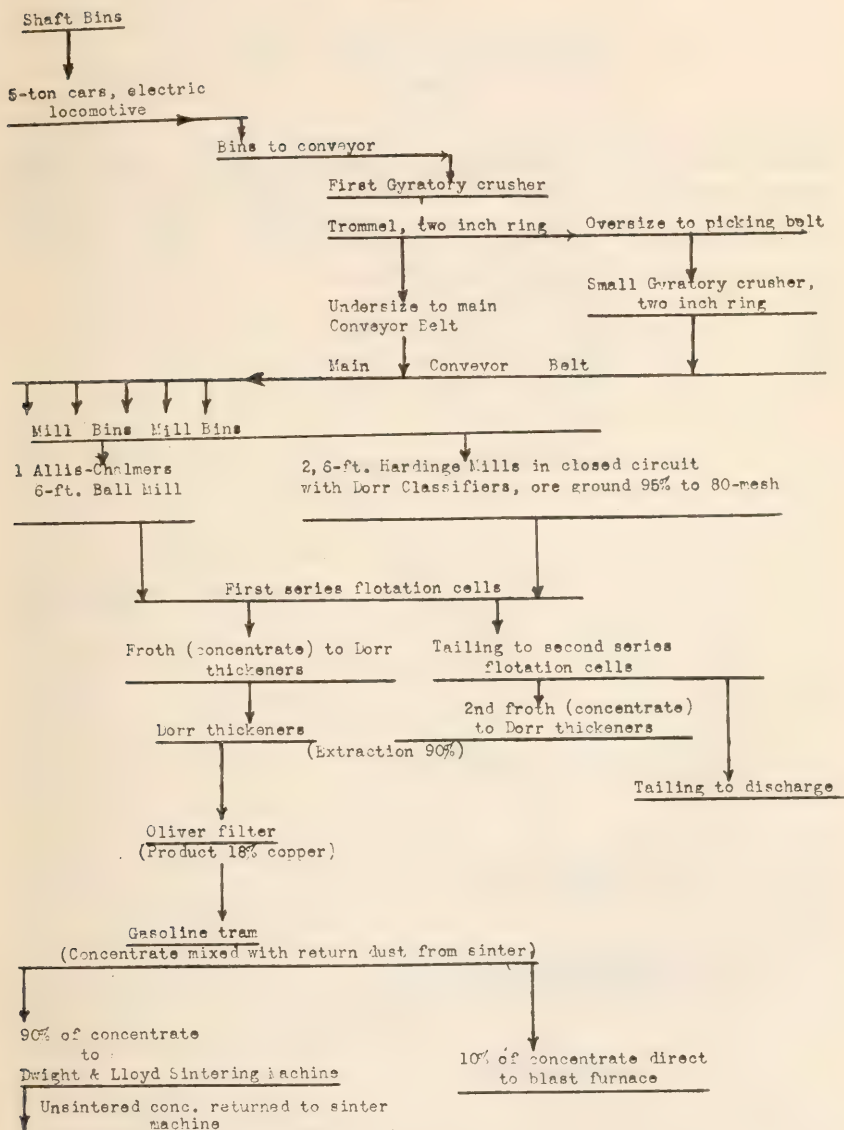

Two hundred men were employed in February, of whom 77 were working underground and producing about 200 tons of ore daily. An extra force on the surface was employed in putting up a new reverberatory furnace. The sinter plant and concentrating plant were being worked two shifts and the 200-ton blast furnace one shift. The mill and sinter plant have a capacity of about 400 tons of 4 per cent ore a day. A new reverberatory furnace being built will replace the blast furnace for smelting concentrate and the latter will then be used for smelting high-grade ore, containing 10 per cent copper or better, some of the ore being of such high grade that it would serve no purpose to put it through the concentrator. Blister copper and matte are shipped to the Tacoma smelter. An interesting feature of the plant is the gunite-covered furnace stack, which is 145 feet long. This was built of one-inch common pine lumber, with four inches of gunite outside and two inches inside. This work was done fifteen months ago and is in good shape, without any repairs having been made.

There follows an approximate flow sheet of the concentrating and smelting operations. For parts of this and other details about the property, the writer is indebted to Mr. S. A. Spellmeyer, mining engineer at the property.

Flow Sheet, Calaveras Copper Company.

Flow Sheet, Calaveras Copper Company.

PART 2.

BINS

Mono County.

Comanche Mining and Reduction Company's properties were visited late in 1923 by W. B. Tucker, of the Bureau's Los Angeles office, and the following notes are from a field report prepared by him:

The properties are two miles southwest of Benton and contain 720 acres, including Comanche, Diana-Kerrick and Cornucopia mines, there being in all 12 patented and 22 unpatented claims, covering most of the principal mining claims on Blind Springs Hill.

The Comanche and Diana-Kerrick properties were worked from 1862 to 1889. The Comanche was stoped from the 550 level to the surface for a length of 860 feet and the Diana-Kerrick vein was stoped for a length of 800 feet from the 650 level to the surface. The mines were idle from 1889 to 1917 when reopened by the present company. The elevation is 6000 to 6800 feet.

The deposits consist of base ores in a series of parallel fissure veins in hornblende granite, the principal minerals being tetrahedrite, pyrrargyrite, chalcopyrite, pyrite and galena, with silver predominating in value. Veins strike N. 20° W. and the strongest vein, the Comanche, dips 82 degrees east, the others dipping 40 to 45 degrees east. Ore lenses are from 30 feet to 200 feet long and the high-grade streaks are from 2 inches to 3 feet wide.

The four principal shafts are: Comanche, 700 feet deep; Diana, 800 feet deep; Kerrick, 650 feet deep, and Cornucopia, 400 feet deep. The Comanche vein has been drifted 1050 feet, Diana-Kerrick vein 1500 feet and Cornucopia 1000 feet to the time the present company began. The present operators have cleaned out and retimbered the Kerrick shaft to 650 feet where the vein is reported to be 10 feet wide and to be steepening in dip. The recent development has been confined to the Comanche, Kerrick and Hudson Mines. During 1922, \$20,000 of ore is reported to have been shipped from the Hudson claim, ore running from \$100 to \$600 a ton in gold and silver. The Kerrick shaft was being sunk at the time of visit. An inclined shaft was being sunk below the tunnel level on the Hudson claim and a raise was being put up from the Comanche tunnel to the surface. Eighteen men were employed.

Benton Mining and Development Company. J. S. Adair, general manager, 404 Union Bank Building, Los Angeles. This company is developing a group of six claims formerly owned by the Patrick Reddy Estate, and situated four miles south of Benton station on the southeast slope of Blind Spring Hill. Development consists of a tunnel 500 feet long which is being run to develop two veins that were worked in the early eighties. The veins strike north and south and dip 40 to 45 degrees east. Six men were employed.

Placer County.

American Bar Mining Company. John McCandless, president; Harry A. Kunz, secretary. Office, 859 Mills Building, San Francisco. The mine is 3½ miles by road and trail from Michigan Bluff and was described in the 1922 report, but a great deal of new work has been done since.

In the Lewis or upper adit there is a drift 150 feet north and at a point 120 feet from the portal there is a winze 23 feet deep from the

bottom of which a drift runs south 20 feet. The Duffey adit is 220 feet vertically below the Lewis adit. It is a crosscut for 500 feet to the vein, and is then drifted 480 feet south and 170 feet north on the vein. From the face of the north drift they crosscut 65 feet east and 80 feet west. The main crosscut was also run 300 feet past the vein. All the work on this level is new except the first 300 feet of crosscut. J. A. Shields reports that the Duffey south drift is in ore for a length of several hundred feet and an average width of $3\frac{1}{2}$ feet, and also that there is ore for the full length of the Lewis and winze levels, totaling 170 feet. The grade of ore indicated by assays is very good and it is expected that milling will begin soon in the old 10-stamp mill which has been repaired.

A ditch taking water from the river has been put in shape to furnish water for power to operate the mining and milling machinery. It has a capacity of 1000 miner's inches. A total crew of 25 men were employed in February, 1924.

Plumas County.

Engels Copper Mining Company. The annual report of this company, the largest copper producer of the state, for 1923, was made public at the end of February. It shows that during 1923 the output was 14,450,243 pounds of copper of a gross value of \$2,081,357; 165,441 ounces of silver of a value of \$125,601 and \$49,243 gold, or a total gross output of \$2,256,201. Cost of copper on the cars at Engels is reported to have been 7.465 cents per pound of copper; freight and smelter charges, less credits for gold and silver were 3.881 cents a pound, and net production cost after allotting reserves for depreciation, compensation insurance and amortization on development is given at 12.931 cents a pound. The average ore milled as mentioned in our past reports, has carried about 2.25 per cent copper. The profit and loss statement for 1923 shows the following items of interest because of their bearing on costs:

| | | |
|--|--------------|----------------|
| Net receipts from concentrates delivered to smelter----- | | \$1,467,786 74 |
| Value of concentrates in transit----- | | 52,735 51 |
| Total value of production----- | | \$1,520,522 25 |
| Sundry profits ----- | | 23,929 42 |
| Total ----- | | \$1,544,451 67 |
| Operating expenses— | | |
| Mining ore ----- | \$635,338 35 | |
| Milling ore ----- | 317,111 73 | |
| Aerial tramming ----- | 19,896 58 | |
| Marketing expenses ----- | 7,164 14 | |
| Crushing expenses ----- | 11,756 55 | |
| General mine expenses ----- | 11,294 81 | |
| General expenses, San Francisco office----- | 41,078 94 | |
| Taxes, interest, insurance----- | 35,161 70 | |
| | | 1,078,802 80 |
| Operating profit ----- | | \$465,648 87 |
| Less development expenditure----- | | 95,675 25 |
| | | \$369,973 62 |
| Reserve for depreciation----- | \$100,180 36 | |
| Reserve, compensation ----- | 33,080 01 | |
| | | 133,260 37 |
| Balance to profit and loss----- | | \$236,713 25 |

No. 10, the new long tunnel, which starts 6500 feet north of the mill and opens the Engels orebody 480 feet below the No. 7 level, had been nearly finished at the end of the year. This tunnel is $8\frac{1}{2}$ by 8 feet in cross section, 8337.3 feet long to the raises and has cost \$28.75 a foot, including equipment required to drive it. The costs of various items in connection with this project are reported as follows:

| | |
|--|--------------|
| Haulage tunnel ----- | \$240,246 01 |
| Raises ----- | 25,305 39 |
| Railroad ----- | 39,039 32 |
| Additions to mill ----- | 15,853 35 |
| Water line to mill ----- | 10,358 61 |
| Total to date of report ----- | \$330,802 68 |
| Estimated balance required to complete ----- | 75,000 00 |
| Total ----- | \$405,802 68 |

When the tunnel is put in use it will eliminate the tramway from Engels Mine to the mill and is expected to pay for itself in a few years by the saving in operating cost.

Sacramento County.

Associated Development Company, Clay, Cal. This private company has drilled two wells named Mitchell No. 1 and No. 2 in search of oil one-half mile northwest of Clay. No. 1 well was put down about 1900 feet when work was stopped by operating trouble. No. 2 well is about 1250 feet northwest of No. 1 and has been drilled to a depth of 2963 feet (March 20). On that date preparations were being made to cement off water, preparatory to testing the formation near the bottom of the well. The operators state that in the course of drilling several strata of sand have been encountered that gave cuts of oil with ether.

Little light is shed on the underground structure by surface indications. The surface is mantled by gravel and sand and the only formation that has been positively identified is the Ione, but it appears from the physical character of the sand brought up that the hole has been in the Cretaceous series for a long distance and is still in it. The two wells are upon a slight ridge with its long axis northwest and it would be hard to say if this is a minor fold or an erosion feature, though probably the latter.

Sierra County.

H. L. Berkey was given a permit to hydraulic at *Scales Hydraulic Mine* the last week in February. Tailings will drain into Rock Creek, Canyon Creek and North Fork of Feather River. This is the first hydraulic mine to make use of the new Bullards Bar dam of the Yuba River Power Company, but on account of the very dry season little can be done this spring.

Tightner Mine was sold in February to the Alleghany Mining Company, and by the latter company sold immediately to the Original Sixteen-to-One Mining Company. The transfer included all the Tightner property except the Red Star claims, in which the Alleghany Mining Company has carried on for several years a persistent search for the downward extension of rich ore found years ago in the upper workings of the Red Star.

Yuba County.

Nevada Claim. R. H. Postlethwaite, owner; P. M. Simpson, lessee with option, Camptonville. This claim is on Willow Creek about five miles from Camptonville and 21 miles from Nevada City, and is a gravel deposit covered by placer mining tailings and soil. It contains 141 acres, covers about 7000 feet along the creek to an average width of 50 to 75 feet and the best pay stratum is about $4\frac{1}{2}$ feet thick on the bottom. Sampling indicates an average value of about 30 cents a cubic yard and a total depth of 10 feet or more, according to Simpson.

Simpson stated late in March that he has turned over his option and lease on part of the claim to E. T. Fisher and on the balance to Barker of the La Grange Dredging Company. Fisher is installing a drag line scraper to work his portion of the claim and it is expected that the dredging company will begin prospecting work soon with the idea of moving their dredger from La Grange if the property proves satisfactory.

SAN FRANCISCO FIELD DIVISION.

C. MCK. LAIZURE, Mining Engineer.

Contra Costa County.

Chipman Chemical Engineering Company, Inc. This company, which is one of the largest producers of calcium arsenate, lead arsenate, paris green and other insecticides in the United States, recently started operations at its new arsenic reduction works at Martinez, and a small amount of refined white arsenic has already been produced from ores shipped in from various points in California and Nevada.

The new plant at Martinez is situated on the Southern Pacific Railroad and also has water shipping facilities, comprising a dock extending into the bay at which vessels drawing 26 feet of water may be unloaded.

The initial installation consists of storage bins, crushing plant, belt conveyor system, Wright 6-hearth roaster, oil-fired with automatic temperature control, dust chamber and arsenic kitchens. The latter are so arranged that they can be cleaned up during operation, thus making it unnecessary to shut down the plant for the purpose of taking off the arsenic. From the kitchens the waste gases pass into a flue and hence to the stack. Two supplementary roasters are in course of erection.

The arsenic plant was designed by Mr. Ralph N. Chipman, president of the company, and Mr. Charles R. Wraith of the Anaconda Copper Company, and has been erected under Mr. Chipman's personal supervision. For the present the plans are to keep the plant running on custom ore and later also to roast ores to be shipped in from the company's mining properties now under development by its subsidiary, the Arsenic Products and Refining Company.

The new Chipman Chemical Engineering Company's plant is regarded as a valuable supplement to other sources of arsenic production. Its first year's operation is expected to supply about 3000 tons of white arsenic, and this capacity it is expected will be doubled in 1925, when their mines recently acquired get into full production.

The company is in the market for arsenious ores and concentrates preferably with a minimum of 20 per cent arsenic, but will accept lower grade ores if in large quantity. They will be pleased to hear from

parties having arsenic properties, and assay reports will be made on any samples sent in. Address, Chipman Chemical Engineering Company, Inc., Martinez, California. C. L. Pierce is works manager.

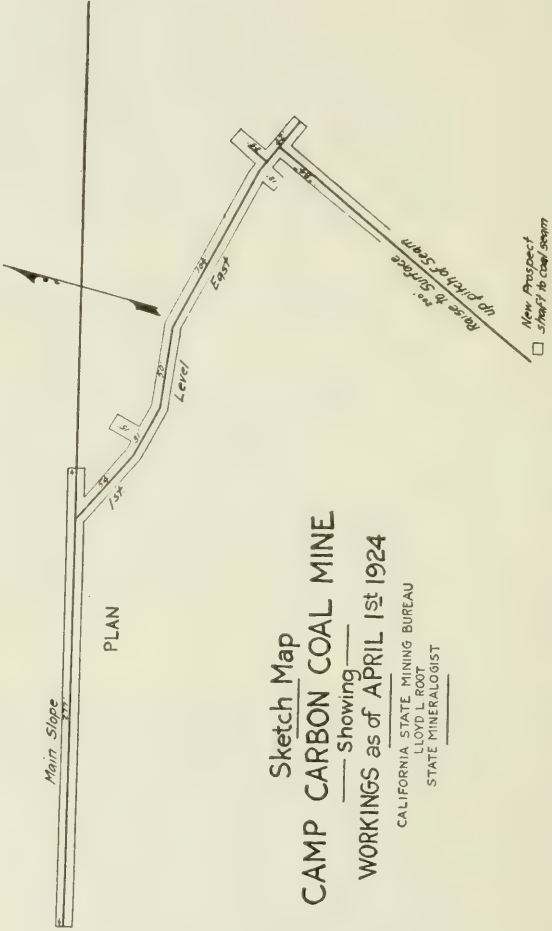

Mount Diablo Lime Marl Company. Property consists of 51 acres, situated about 5 miles northeast of Walnut Creek on what is known as Lime Ridge. Limestone outcrops conspicuously over a considerable area along this ridge. Where opened up by the Mount Diablo Lime Marl Company, the limestone is more or less soft and decomposed near the surface, but as depth is reached in the open cuts the rock becomes crystalline and of a brownish or grayish tint. The property has not been drilled to determine the extent of the deposit, but from the surface exposures and various open cuts, it appears that there is a very considerable tonnage available. The company has a plant for crushing, screening and sacking the ground limestone; or the crude limestone in lump form may be loaded from bins direct to auto trucks. The Southern Pacific Railroad is $1\frac{1}{2}$ miles, and the San Francisco-Sacramento Railroad is 1 mile distant.

The crushing plant contains a gyratory and Grindler hammer mill, operated by electric power. For agricultural use the limestone is ground so that 60 to 80 per cent passes 100 mesh. The calcium carbonate content is controlled by varying the amount of crystalline limestone ground with the softer material. The plant has a capacity of 100 to 150 tons per day of agricultural lime meal. Uncrushed limestone is sold for fluxing to the Martinez smelter of the Mountain Copper Company. Some has also been used by the Pure Carbonic Company of Berkeley for making carbon dioxide gas. Two sheet steel upright kilns were on the ground at the time of visit and it is the intention of the company to erect these and produce calcined lime as well. R. L. Fry, Walnut Creek, is president and general manager, and G. A. Putman is secretary.

Lake County.

T-B-M Prospect. J. W. Mauldin of Finley, C. A. Traylor and G. W. Bruce have obtained from the State Surveyor General a mineral lease on 160 acres of state land located in Sec. 16, T. 12 N., R. 9 W. The property is about 7 miles south of Kelseyville. There is a road to the Fifield ranch, then a trail of $1\frac{1}{2}$ miles to the prospect, which is situated in a rugged portion of the ridge separating Lake and Sonoma counties. The formations in this vicinity are the typical Franciscan of the coast range, consisting of carbonaceous slates, schist and serpentine, much broken and altered. Some quartz float is found in the vicinity, but so far prospecting has failed to locate any definite vein that would indicate a permanent orebody. An incline shaft 40 feet deep, with a slope of about 45 degrees, has been put down along a series of small quartz lenses and siliceous segregations, impregnated in places with fine pyrite. Chalcopyrite and bornite also showed occasionally in small quantity. Assays are said to show values of \$3 to \$23 per ton in gold, none of which is free. So far as developed the showing is not impressive. One man is working.

A somewhat similar deposit was located in 1911, in Sec. 31, T. 16 N., R. 9 W., on which some development work was done and pyrite ore, assaying from \$5 to \$34 per ton, was reported to have been found.

CAMP CARBON COAL MINE
Showing
WORKINGS as of APRIL 1st 1924

CALIFORNIA STATE MINING BUREAU
LLOYD L. ROOT
STATE MINERALOGIST

Mendocino County.

Camp Carbon Coal Mine. A description of this property was included in a report on coal in Mendocino County, published in Report XIX of the State Mineralogist, September, 1923. The Carbon Company, owner, was formally incorporated on December 26, 1923, with an authorized capital of \$500,000, divided into 10,000 shares at \$50 per share. Officers of the company are J. Cal Ewing, president; Max Horwinski, vice president; Frank T. Thompson, secretary; A. L. Fisher, general manager. Offices, 420 Henshaw Building, Oakland, California. Since the last report the company has installed an additional boiler and other equipment, and continued development of their holdings. At a point approximately 525 feet from the main entry a drift was turned south at right angles, which will be extended up the pitch of the bed and connect with a new prospect shaft that will improve the ventilation and give additional access to the coal. The workings as of April 1, 1924, are shown on the accompanying sketch map.

PLATINUM.

The deposit of platinum and gold, located about 2 miles east of Hopland in Secs. 21 and 28, T. 13 N., R. 11 W., has been recently taken over by Lloyd C. Ashley, 1236 St. Charles street, Alameda, and preparations are being made for working it. A report on the property by Logan¹ was published in Bulletin No. 85. The property was acquired in 1920 by the Mendocino Mining and Milling Company, Inc., and an elaborate plant, operated by electric power and designed to handle 350 tons per 24 hours, erected. Its operation was not successful, and it was shut down after one or two day's trial, and later dismantled, only the concrete foundations remaining. The present owner will adopt a simple washing system.

LOS ANGELES FIELD DIVISION.

W. B. TUCKER, Mining Engineer.

Imperial County.**SODIUM SULPHATE.**

Bertram Sodium Sulphate Deposit is located $2\frac{1}{2}$ miles northeast of Bertram Station on the Southern Pacific Railroad, in Sec. 19, T. 9 S., R. 12 E. Elevation 125 feet below sea level. Holdings consist of 320 acres. Owner, E. N. Smith, El Centro, California.

The eastern border of the Salton Sink is made up of Tertiary sandstones and clay beds extensively folded. In the vicinity of Durmid, Bertram and Frink, these beds have been planed off and form a portion of the smooth, sloping desert floor below the old beach line. Generally, however, along this eastern margin of the desert they are deeply eroded and form rough foothills along the base of the higher mountains to the east.

The deposit is mainly thenardite, anhydrous sodium sulphate, which has a crystal form distinct from that of mirabilite, and is not so subject to alteration on exposure to the air. Mirabilite, glauber salt, is here associated with the thenardite, usually occurring on the top of the veins

¹C. A. Logan, Platinum and Allied Metals in California, Cal. State Mining Bureau. Bull. 85, 1918.

of thenardite. These parallel veins of sodium sulphate occur in the consolidated clay beds and sandstones which are extensively folded. The general strike of these beds is N. 70° W., dip 30° to 40° N. The

Salt Cake (mainly thenardite, anhydrous sodium sulphate). East open cut, near Bertram Station in the Salton Basin, Imperial County—Photo by E. N. Smith.

Exposure of Salt Cake (thenardite) in West open cut, near Bertram Station in the Salton Basin, Imperial County—Photo by E. N. Smith.

above mentioned veins of thenardite have a thickness varying from 8 inches to 3 feet.

The proved area containing sodium sulphate is about one-half mile

wide, and about 3000 feet in length. Samples taken from borings throughout this area are reported to carry 10 per cent to 12 per cent sodium sulphate.

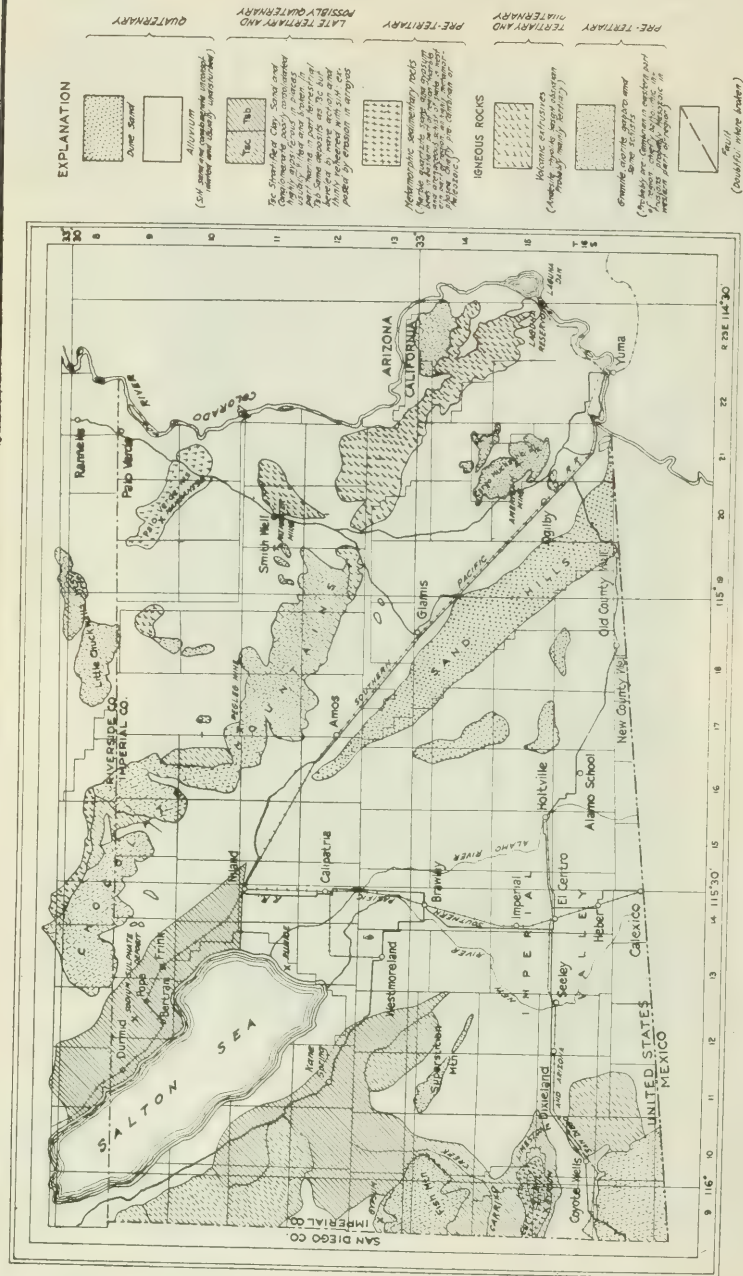

The deposit was originally located by Havens of Imperial Valley, in 1903, as the Glauber Salt Mine, but it was found that the land was owned by the Southern Pacific Railroad. E. N. Smith, of El Centro, purchased the land in 1919. Mr. Smith developed the deposit during the years 1919 to 1921. The property was under lease to E. H. Otto and Company from November 1922, to June 1923, when operations were

Bertram 'Salt Cake' Deposit, in Salton Basin, Imperial County, showing steam shovel at East open cut.—Photo by E. N. Smith.

suspended. During this period Otto and Company shipped about 2500 tons of salt cake.

Workings consist of an open cut 600 feet in length and about 14 feet in depth, on the east end of the property. In this open cut, three parallel veins of thenardite interbedded in the clay beds were exposed, being about 4 feet apart, and varied in thickness from 18 inches to 4 feet. In the west end of this open cut, the veins formed a junction and the thickness of the material mined is stated to have been about 6 feet. About 2700 feet west of this open cut is another open cut about 200

feet in length and 14 feet deep. Here two veins of thenardite were worked, which had an average thickness of 2 feet, being separated by beds of clay about 4 feet thick. The dumps from these open cuts are stated to carry 12 per cent sodium sulphate.

Samples of sodium sulphate crystals collected by E. N. Smith were analyzed by Smith, Emery and Company, of Los Angeles, as follows:

Analysis of sodium sulphate from Bertram, California—Sample No. 1:

| | |
|--|---------|
| Water Insoluble | Trace |
| Iron and Aluminum Oxides | None |
| Calcium Oxide (CaO) | None |
| Magnesium Oxide (MgO) | Trace |
| Sodium Oxide (Na ₂ O) | 43.64% |
| Moisture (105°) | .07% |
| Combined Water | .12% |
| Chlorine (Cl) | .10% |
| Boric Anhydride (B ₂ O ₃) | None |
| Sulphuric Anhydride (SO ₃) | 56.22% |
| Total | 100.15% |

Hypothetical Combination:

| | |
|--|---------|
| Sodium Sulphate (Na ₂ SO ₄) | 99.80% |
| Sodium Chloride (NaCl) | .16% |
| Magnesium Sulphate (MgSO ₄) | Trace |
| Moisture and Combined Water | .19% |
| Total | 100.15% |

Sample No. 2:

| | |
|--|---------|
| Water Insoluble | 0.39% |
| Iron and Aluminum | None |
| Calcium Oxide (CaO) | None |
| Magnesium Oxide (MgO) | 0.16% |
| Sodium Oxide (Na ₂ O) | 43.40% |
| Moisture (105°) | .02% |
| Combined Water | .35% |
| Boric Anhydride (B ₂ O ₃) | None |
| Sulphuric Anhydride (SO ₃) | 56.40% |
| Total | 100.72% |

Purity as Sodium Sulphate (Na₂SO₄) 98.80%

There is an increased demand for sodium sulphate which is used in the making of wood pulp in the United States by the so-called sulphate process. This process uses sodium sulphate in making sodium sulphide, which is one of the active chemicals in the process, the other being sodium hydroxide. Salt cake for this process should be ground, and should contain at least 95 per cent of anhydrous sodium sulphate. The sodium chloride should not exceed 2 per cent. Sodium sulphate is also used in the manufacture of glass.

Los Angeles County.

California Clay Products Company, offices 315 Western Mutual Life Building, Los Angeles, Victor Kremer, president and R. B. Keeler, secretary, has recently increased the capacity of its plant at Southgate. The company controls large deposits of white burning clay in San Diego County. Their principal products are glazed and colored tile.

San Bernardino County.

CLARK MOUNTAIN DISTRICT.

This district embraces that portion of the old Ivanpah District in the immediate vicinity of Clark Mountain. The district is situated in T. 17 and 18 N., R. 13 and 14 E., 10 miles northeast of Valley Wells, and 17 miles west of Roach station on the Union Pacific Railroad. The district contains deposits of gold, lead, silver, and tungsten.

The formation of the district consists principally of quartz-monzonite and limestone. The gold veins occur in quartz-monzonite. Wolframite and scheelite occur associated together in a system of narrow quartz fissure veins in quartz-monzonite. The silver-bearing lodes occurring in Cambrian limestone, though not large, produced considerable rich silver ore. Silver mining in this district was active during the '80s and early '90s. Most of the old mines ceased operations when the price of silver dropped below \$1, and since that time have only been worked spasmodically by 'chloriders.'

Among the most important producers were the following: Allie and Beatrice, Bob Lee and Mattie, Coliseum, Lizzie Bullock, Monitor, U. S. and Stonewall mines.

MINES.

Coliseum Mine, situated in the Clark Mountain District, on the east slope of Clark range of mountains, at an elevation of 5000 feet, 32 miles south of Good Springs, Nevada, and 10 miles northeast of Valley Wells.

Holdings consist of two patented claims, known as Coliseum No. 1 and No. 2, and 20 claims held under location, located in T. 17 N., R. 13 E. Owner, T. W. Devereaux, Pasadena, California. The property was taken over under option September 1, 1923, by C. H. Gowman, Hollywood, California.

The ore occurs along fractures in quartz-monzonite, which strike N. 50° E. to N. 70° E., and dip 80° S. The filling along these fractures has been silicified, and occurs as a silicified breccia which is mineralized with iron pyrite and some chalcopyrite. The orebody developed is about 50 feet wide, and 100 feet in length. The average value is said to be \$7 in gold. Developments consist of vertical shaft 200 feet deep with levels at 100 and 200 feet. Crosscuts have been driven north on the 100-foot and 200-foot levels, 350 feet, with drifts to the southwest in the orebody. On the opposite slope of the ridge, a cross-cut tunnel has been driven S. 28° E., 600 feet. At 500 feet from the portal it cut the first showing of ore. At 600 feet from the portal, a drift has been driven northeast 70 feet, of which 40 feet is in ore, and another drift has been driven southwest 125 feet in ore. The orebody developed on this level is about 60 feet wide and 125 feet in length, and is said to average \$7 per ton in gold. Present development is confined to driving a tunnel on the southwest slope of the ridge to cut the orebody on the same level as the shaft. Water is secured from Old Green Mine, formerly operated by the Mojave Tungsten Company of New York, now owned by S. E. Yates of Valley Wells. Four men are employed.

Bank Roll and Green Gold Group of claims are located in Clark Mountain Mining District, in T. 17 N., R. 13 E., on the west slope of Clark Mountain, 7 miles northeast of Valley Wells, and 23 miles north

of Cima, a station on the Union Pacific Railroad. Elevation 6000 feet. Owner, Louis F. Keiper, Cima.

Holdings consist of six claims known as Contact, Bank Roll No. 1 and No. 2, Green Gold, Green Gold No. 1 and No. 2.

Ore occurs along a series of north-south and east-west fissures in quartz-monzonite intrusion, not far from the limestone contact. These fissures are narrow, not over 8 inches to 2 feet in width, and small lenses of lead ore occur at intersections of the fissures.

The principal minerals are galena, sphalerite, and chalcopyrite, which carry values in gold and silver, in a quartz gangue. Samples taken from different workings are reported to assay Ag=20 ozs., Pb=25%. Development consists of a number of tunnels and open cuts on the different claims. The most extensive amount of development is confined to the Bank Roll claims. Here a cross-cut tunnel was driven S. 50° E. 300 feet, then as a drift S. 50° W., 200 feet towards the contact of quartz-monzonite and limestone. About 100 feet in elevation above this tunnel, there is a tunnel 50 feet in length driven on a N. 40° E. fissure, which developed a small lens of lead sulphide ore.

On Green Gold claims there are two tunnels about 50 feet in length which developed some ore.

On the Contact claim, which is located along the granite and limestone contact, in an open cut, there is exposed 4 feet of silicified brown limestone which is mineralized with galena.

Calarivada Silver Mines comprises 15 claims located on the north slope of the Clark Mountain range of mountains, in T. 18 N., R. 13 E., 12 miles northeast of Valley Wells. Owner, Calarivada Silver Mines, Inc., of Detroit, Michigan; Walter X. Osborne, president and general manager.

Developments consist of a 200-foot shaft. Ore carrying values in copper, gold and silver occurs in fractures in limestone. Equipment consists of 12-h.p. gasoline hoist, cars and blacksmith shop. Two men are employed.

Copper Commander Group (copper), consists of four claims, which adjoin the Copper World Mine on the northwest, situated in the Clark Mountain Mining District, 6 miles northeast of Valley Wells and 22 miles north of Cima, a station on the Union Pacific Railroad. Elevation 5500 feet. Owner, Mike Conway, Cima, California.

The ore occurs in a broad mineralized zone at contact of granitic porphyry and limestone. The granitic porphyry is an intrusive into hard gray colored limestone, and the copper ores are found through the porphyry for a considerable distance from the contacts. In the mineralized zone which is about 200 feet in width, and has a general north-west strike, veinlets of copper ore occur mostly as brown oxides, with occasional bunches of malachite and azurite. Very little sulphide ore has been encountered, but some chalcopyrite was encountered in lower workings on the property. The ore is low grade, said to average about 4 per cent with occasional bunches of 10 per cent copper ore.

Workings consist of a tunnel 140 feet in length driven southeast on contact of porphyry and limestone, also a number of short tunnels and open cuts made along the contact, all of which expose some ore. One man is employed.

Ellingsford-Nipton Group consists of three claims located 10 miles northeast of Valley Wells, in the Clark Mountain Mining District. Elevation 5000 feet. Owner, Thomas E. Creed, Santa Ana, California.

Developments consist of two shafts 20 feet deep, sunk on a N. 60° E. fissure in the limestone. A small lens of ore has been developed where this fissure was cut by a northwest fissure. The ore occurs as silver chloride, with some bunches of black metal. Average value is said to be about 20 ounces in silver and 6 per cent lead. This prospect is located west of the Coliseum Mine. Two men are employed.

Silver King Mine consists of six claims located in T. 18 N., R. 13 E., in the Clark Mountain Mining District, 10 miles northeast of Valley Wells. Owner, Jack Encell of Los Angeles. Silver bromide and chlorides occur along a fault fissure in the limestone, which has a course of N. 40° W., dip 40° southwest. Developments consist of a tunnel 160 feet in length and a number of open cuts along the fissure. Idle.

Snow Storm Mine consists of four claims located in T. 18 N., R. 13 E., in the Clark Mountain Mining District, 12 miles northeast of Valley Wells. Silver bromide and chloride ores occur along northwest and southeast fissures in the limestone. Three shafts have been sunk on the different fissures to depths of 60 feet, exposing veins 12 inches to 3 feet wide, which dip 30 degrees to the southwest. The ore is stated to assay from 10 to 50 ounces in silver. George Miller, of Good Springs, Nevada, owner.

Stonewall Mine is located in T. 18 S., R. 13 E., in the Clark Mountain Mining District, about 12 miles northeast of Valley Wells, and 18 miles northwest of Nipton Station on the Union Pacific Railroad.

Holdings consist of 15 claims. Owners, Martin A. Kiwisar and B. M. Laurence, of Good Springs, Nevada.

This property was extensively worked from 1881 to 1896, and was one of the largest silver producers of the district. Developments consist of a number of tunnels driven at different elevations along a fault fissure which has a general strike of N. 35° W., dip 50° northeast. Width of vein was about 3 feet. The ore, which is a bromide and chloride of silver, occurred in irregular lenses along this fracture. A lower tunnel was driven west 100 feet to the vein, then 500 feet to the southeast on the vein, which has been stoped out to the surface. About 150 feet above this tunnel, there is another tunnel driven 600 feet on the fissure, which also has been stoped out to the surface. Idle.

U. S. Mine is located in T. 18 N., R. 13 E., in the Clark Mountain District, about 12 miles northeast of Valley Wells, and 17 miles northwest of Nipton, a station on the Union Pacific Railroad. Elevation 5000 feet.

Holdings consist of four claims, owned by C. R. Loomis, of Good Springs, Nevada. Under option to Calarivada Silver Mines, Inc. Walter X. Osborne, manager.

Property has been worked off and on since 1880 and was an important producer of silver ore in this district. Workings consist of three tunnels. The lower or main working tunnel is driven S. 20° W., 150 feet, where the Beatrix vein was cut. This vein has been drifted on 150 feet southeast, and 600 feet to northwest. The vein is 4 feet wide, and

the ore occurred as bromide and chloride of silver, in lenses along the fissure. This vein has been stoped to the surface. Several winzes have been sunk to a depth of 40 feet below the tunnel level which show from 8 inches to 2 feet of ore. Vein strikes N. 30° W., dip 50° northeast. There is another vein known as the U. S. which lies south of the Beatrix vein, and runs parallel to it, but dips 40 degrees to the northeast. This vein is developed by a cross-cut from the north drift on the Beatrix vein. The mine is reported to have produced some very high-grade silver ore. The lower workings have been recently cleaned out and retimbered. Two men are employed.

Valentine Group comprises 14 claims located on the western slope of Clark Mountain, in T. 17 N., R. 13 E., 5 miles northeast of Valley Wells, and 23 miles north of Cima, a station on the Union Pacific Railroad. Elevation 6500 feet. Owner, Louis F. Keiper, Cima.

These claims were located in February 1920, on the discovery of some high-grade argentiferous lead sulphide ore along a fissure in the limestone. The country rock consists of gray limestone with beds of shale and diorite intrusions along the bedding planes of the limestone. The limestones and shales are very much folded on the western slope of Clark Mountain. Lead sulphide and lead carbonate occur along a fissure in the limestone, conformable to the bedding planes of the limestone which is folded along the strike. The general course of the fissure is north, with a dip of 50 degrees to the east. The fissure has an average width of 5 feet and is filled with brown silicified limestone with a diorite intrusion on the footwall. The silicified limestone is mineralized with galena and lead-zinc carbonates. At different places along this fissure for 4000 feet, showings of galena ore have been exposed in open cuts and prospect shafts. The most extensive work has been done on Valentine No. 1 claim. Here a cross-cut tunnel has been driven 130 feet to cut the ore exposed in a tunnel 50 feet in length at a higher elevation. The ore exposed in this upper tunnel has a width of 5 feet and is developed for 30 feet in length. Samples taken from these workings are reported to have assayed 8 to 15 ounces in silver, and 30 per cent lead. Workings on this claim consist of 3 open cuts and two tunnels, all showing galena and carbonate ore.

On Valentine No. 2 claim, about 150 feet south of No. 1 workings, along the fissure is a small cave deposit filled with lead-zinc carbonates, said to carry 10 to 15 per cent zinc, and 10 to 15 per cent lead. There are thirty tons of sorted ore on the dump of No. 1 workings, which, it is stated, will assay 50 per cent lead. Water is secured from Pachalka Spring, which is located about one mile from the workings. Two men are employed.

LEAD MOUNTAIN DISTRICT.

War Eagle Mine is located on the eastern slope of the Lead Mountains in T. 4 N., R. 10 E., 9 miles south of Bagdad, a station on the Atchison, Topeka and Santa Fe Railroad. Elevation, 1800 feet. Owner, *Bagdad Silver Mines Company*, 53 State street, Boston, Mass. C. O. Ellingwood, president; J. F. Mullen, secretary.

Holdings consist of Alpha, Lead King, and Lead Queen group of claims, comprising 320 acres. The property was worked by the South-western Lead Company of Los Angeles from 1912 to 1920, when

acquired by the Bagdad Silver Mines Company which operated the property continuously until June 1923, when operations were suspended.

The ore deposits occur in a well-defined fault fracture in rhyolite porphyry, striking N. 60° W., and dipping 40° southwest. The hanging wall of the fault is a brecciated tufa. The ores found along the fissure are similar in character, being chlorides and chloro-bromides, with some galena and lead carbonates in crushed breccia in the fissure. Irregular ore bodies occur in the fissure varying from 12 inches to 12 feet in width. An incline shaft has been sunk on the vein to a depth of 700 feet, with levels at 100, 200, 300, 400, 500, and 600 feet, with over 7000 feet of drifts and cross-cuts. The oreshoot trends to the northwest and below the 200-foot level all development has been to the northwest. It is stated that the average ore mined assayed 8 per cent lead, and 7 ozs. silver. The ore mined was treated in a 25-ton concentration mill.

Mill equipment: 8" x 7" Blake crusher, Challenge ore feeder, Ball mill, and two Wilfley tables; also Stebbins dry concentrator. Mill driven by 37½-h.p. Fairbanks-Morse gas engine. Water for mill secured from well on dry lake, 3 miles northeast of mine.

Pump equipment: 4" x 6" Triplex pump driven by 40-h.p. Fairbanks-Morse gas engine.

Mine equipment: 37½-h.p. Fairbanks-Morse gas engine hoist, compressor, air drills, cars, blacksmith shop, assay office, and bunkhouses. When operating, 20 men were employed. Idle.

RANDBURG DISTRICT.

California Rand Silver, Inc., during the latter part of February, curtailed mill operations to one shift per day of eight hours, and the regular dividend disbursement of 2 cents per share, or \$25,600 monthly, will be discontinued until ore reserves are increased by intensive development. For four years the company has paid 2 cents per month, and, in addition, has paid four extra dividends of 10 cents, making a total of \$3,018,400 in dividends. The company plans an intensive development campaign to explore new territory on the property, to add to the present ore reserves in proven territory. The company reports that the development work during the past six months has proven satisfactory, and three promising ore zones have been developed.

During January, 8100 tons of ore was milled, averaging \$18.10 per ton. Concentrates shipped amounted to 456 tons, which netted approximately \$106,776. For the month of February 4698 tons of ore was milled; a daily average of 162 tons.

The highest extraction ever obtained by the company in the operation of the mill, was made during the month of February, the average gold extraction being 84.5 per cent; silver extraction was 97.46 per cent, making a total extraction of 96.20 per cent. The net value of the concentrates shipped was approximately \$128,347.50. During the month, 1621 feet of new development was completed.

TUNGSTEN.

Atolia Mining Company, whose property is situated in the Atolia tungsten district, near Randburg, and formerly the largest producer of tungsten ore in California, recently reopened the mine on a leasing

basis. Leases are being granted by the company to miners who may want to prospect and work outlying sections of the property. The company offers to take the ore, concentrate it and market the product, half of the proceeds to be paid to the lessee. In addition, supplies and tools are furnished the lessees at cost, and necessary equipment and machinery to develop mine and hoist the ore, are rented to them under reasonable terms. Payment by the company is to be made on the basis of one-half of 90 per cent of the average quoted market value for 60 per cent tungstic acid, domestic scheelite ore, f.o.b., Pittsburgh, Pa., the quotations to be taken from the Engineering and Mining Journal-Press for the week ending 30 days after date of the preliminary sampling at Atolia. Payment for ores less than 60 per cent tungstic acid content is on the basis of a sliding scale; 75 per cent on content for ores 2 per cent tungstic acid or less; 80 per cent on 10 to 20 per cent tungstic acid content; 85 per cent on 20 to 30 per cent tungstic acid content; 95 per cent on 50 to 60 per cent tungstic acid content, and 100 per cent on ores containing 60 per cent or over in tungstic acid.

Approximately 20 lessees are working on what is known as the 'spud patch.'

Ventura County.

Gillibrand Limestone Deposit, located 5 miles north of Santa Susana, a station on the Southern Pacific Railroad, in Secs. 17 and 18, T. 3 N., R. 17 W., S. B. B. and M. Owner, E. C. Gillibrand of Santa Susana.

Holdings consist of 200 acres, of which 100 acres, located in Sec. 18, is under lease to the *Ventura County Lime and Fertilizer Company*, of Santa Paula, California. E. D. Goodenough, president.

A massive bed of limestone is exposed on the western slope of the Santa Susana Mountains, north of Simi Valley. The general strike of the limestone belt is northeast and southwest with a dip of about 30 degrees to the southeast. The exposure on the property is about 3000 feet in length, and has an average width of 300 feet. It is a decomposed shell deposit of lime.

Ventura Velvet Molding Sand Deposit is located within the city limits of Ventura, on ridge south of Buena Vista Canyon, a mile north of the Southern Pacific Railroad Station, at Ventura. Owner, Charles A. Cole, Ventura, California.

Holdings consist of 28 acres. A bed of unconsolidated sandy loam and fine-grained sand said to be 100 feet thick is exposed in the canyon.

Quarry is 200 feet in length and 75 feet to 100 feet in height. Material handled with scrapers to bins, then screened through No. 4 mesh trommel, oversize going to a set of rolls.

Quality: The sand is very fine grained. About 96 per cent of the sand will pass through 100 mesh, and 48 per cent through the 200 mesh. The sand has a good bond.

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau, as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff and others are published in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

OIL AND GAS RIGHTS.

By A. H. RICKETTS, of the bar of the Supreme Court of the United States, of California and of Nevada.

Copyright, 1924, by A. H. Ricketts.

PART I.

ADJUDICATED TERMS AND PHRASES.

§ 1. As Long as Gas or Oil is Found in Paying Quantities.

The term, "as long as gas or oil is found in paying quantities" means, not merely that those minerals shall be found in paying quantities, but also that either oil or gas shall actually be discovered and produced in paying quantities within the term named in the lease, and if neither oil nor gas is being produced at the end of the term of years named in the lease, the lease ends.¹

§ 2. Casing Line.

A casing line is a large, strong rope used in oil-well drilling to raise and lower the casing.²

§ 3. Commencing Operations.

To commence operations is the performance of some act which has a tendency to produce an intended result.³

§ 4. Completed Well.

The term "completed" as used in a lease means finished or sunk to the depth necessary to find oil or gas in paying quantities, or to such a depth as in the absence of such oil or gas would reasonably preclude the probability of finding oil or gas at a further depth. It can not be construed to mean that the lessee bound himself, under penalty of for-

¹ Union Co. vs. Adkins, 278 Fed. 854.

² Long vs. Foley, 82 W. Va. 502, 96 S. E. 794.

³ Flemming Co. vs. South Penn Co., 37 W. Va. 645; 17 S. E. 203; Terry vs. Texas Co., Tex. C. A., 228 S. W. 1019; Duffield vs. Russell, 13 Ohio C. C. 266; see Henderson vs. Ferrell, 183 Pa. St. 547, 38 Atl. 1018; and see Henning vs. Wichita Co., 100 Kan. 255, 164 Pac. 297.

feiture, to sink a producing well or in the absence of oil or gas to bore through to China.⁴

§ 5. Diligence.

To prosecute drilling with due diligence to success or abandonment means, that there must be a product capable of division between the parties in the proportions mentioned in the lease. Unless this is done, drilling is not prosecuted to success.⁵ The rule is that whatever, under the circumstances, would be reasonably expected of operators of ordinary prudence, having regard to the interest of both lessor and lessee, is what is required.⁶

§ 6. Fixtures.

A fixture is an article which may or may not actually be affixed to the freehold.⁷ Engines, boilers, hoisting works, mills, pumps, electric hoist firmly bolted to the substructure upon which it rests, the superstructure and engine house sufficiently affixed to the soil for mining purposes, a gallows frame together with the gallows, hoist and transformer forming integral parts of one mechanism are fixtures.⁸ So, a boiler and smokestack, derrick, belt house, calf and bull wheels, rig irons, drilling tools, bunkhouse and oil well casing affixed to the land

⁴ Frost vs. Martin. — Tex. C. A. —, 203 S. W. 72. The term "completion of well" for the purpose of operating and testing of the amount of production, as used in a drilling contract, means the clearing of the well after reaching the specified depth, so that the sand reached may give that flow of production, by its own force or by pumping, which would result from a well so prepared in the ordinary and usual manner for making preparation for such test. Twin States Co. vs. Westerly Co., — Okla. —, 220 Pac. 339; see Parish vs. Bridgewater Co., 51 W. Va. 558, 42 S. E. 655. In Chapman vs. Ellis, — Tex. C. A. —, 254 S. W. 616, it is said that the word "completed" is ambiguous, and where ambiguity in the terms of a contract exists, the testimony of experts in matters of the kind called for in the contract is admissible to explain the ambiguity. That a well may not be completed until it is "shot," see Uncle Sam Co. vs. Richards, 76 Okla. 277, 175 Pac. 749. In Unity Oil Co. vs. Hill, — Ky. —, 255 S. W. 151, the well was cased, and showed what was called a "rainbow of oil." It was not shot and was not a producing well; that is, one from which oil in profitable quantities could be taken. It was contended that it was not a completed well within the terms of the contract since it was not shot. It was not shown that the evidence of oil was such as to indicate to a reasonably prudent man that the shooting of the well would result in the production of oil. There was not a pipe line close enough to justify shooting at that time. It was held that in view of the evidence as to the prospects of oil it was not necessary to shoot the well or that the shooting of it could reasonably be expected to make it a producing well; see, also, Rice vs. Ege, 42 Fed. 661. It will be deemed "completed" when the contract depth is reached. Key vs. Big Sandy Co., — Tex. C. A. —, 212 S. W. 300.

⁵ Kennedy vs. Crawford, 138 Pa. St. 561, 21 Atl. 19.
⁶ Eastern Oil Co. vs. Beatty, — Okla. —, 177 Pac. 104; see Hall vs. South Penn Co., 71 W. Va. 82, 76 S. E. 124. That there may be a too strenuous as well as a too dilatory operation see Wellsville Oil Co. vs. Miller, 44 Okla. 493, 145 Pac. 344.

⁷ Merritt vs. Judd, 14 Cal. 59; Watterson vs. Cruise, 179 Cal. 379, 176 Pac. 870; Breyfogle vs. Tighe, 58 Cal. A. 306, 107 Pac. 1036; Conde vs. Sweeney, 16 Cal. A. 157, 116 Pac. 319; Washburn vs. Inter-Mt. Co., 56 Or. 578, 109 Pac. 382; see Midland Oil Co. vs. Rudneck, 188 Cal. 265, 204 Pac. 174. A chattel will remain such although attached to the realty when it is the subject of a conditional sale. Arnold vs. Goldfield Co., 32 Nev. 447, 109 Pac. 718; Montana Co. vs. Northern Valley Co., 51 Mont. 266, 153 Pac. 1017.

⁸ Arnold vs. Goldfield Co., *supra* (7); see Mammoth Co. vs. Juab County, 10 Utah 232, 170 Pac. 78.

become a part of the realty.⁹ By legislative enactment in several of the mining states all machinery or tools used in working or developing a mine, whether they are attached to it or not, are to be deemed affixed to the mine.¹⁰ It is immaterial whether the fixtures be attached to property held by an invalid,¹¹ a possessory or a fee-simple title.¹²

§ 7. Gasoline.

Gasoline is a colorless, inflammable fluid, the first and highest distillant of crude oil, is extracted from it by distillation; and being the most volatile compound of petroleum, it readily separates from it and in the process of distillation is the oil drawn off at the lowest temperature.¹³

§ 8. Gas Well.

The words "gas well" used in an oil lease mean a well having such a pressure and volume of gas, taking into account its proximity to market, as could be operated profitably and the gas utilized or disposed of commercially.¹⁴

⁹ *Conde vs. Sweeney*, *supra* (7); *Son vs. Adamson*, 34 Cal. A. D. 1046. Compare *Cortelyou vs. Baker*, 185 Cal. 168, 187 Pac. 417. As to mining fixtures on withdrawn land see *Son vs. Adamson*, 188 Cal. 99, 204 Pac. 392; *Midland Oil Co. vs. Rudneck*, *supra* (7). Under a lease giving the right to remove any and all buildings and machinery from the leased premises within a reasonable time after the termination of the lease, any property placed on the premises by the lessee remains personal property and does not become a fixture, though actually affixed to the soil. *Cowgill vs. Little Persimmon Co.*, — Mo. A. —, 183 S. W. 346; see *McClendon vs. Busch-Everett Co.*, 138 La. 722, 70 So. 781. In *Patton vs. Woodrow*, 198 Ky. 85, 248 S. W. 226, it is said: "The general rule requires the lessee for oil and gas purposes to remove all fixtures and machinery placed on the premises during the term of the lease, or at least within a reasonable time thereafter. If this is not done, the fixtures and machinery become the property of the lessor, and he may enjoin their removal; if severed from the freehold and then removed without his consent, he may replevin them, or recover their value in an action for damages. This is true where the lessee expressly reserved the right to remove them." See, also, *Monarch Co. vs. Hunt*, 193 Ky. 315, 235 S. W. 772; *Shellar vs. Shivers*, 171 Pa. St. 569, 33 Atl. 95.

¹⁰ *Malone vs. Big Flat Co.*, 76 Cal. 583, 18 Pac. 772; *Britannia Co. vs. U. S. Co.*, 43 Mont. 93, 115 Pac. 46; see *Hamilton vs. Delhi Co.*, 118 Cal. 153, 50 Pac. 378. In California sluice boxes, flumes, hose, pipes, railway tracks, cars, blacksmith shops, mills and all other machinery or tools used in working or developing a mine, are deemed to be affixed to the mine. Sec. 661, Civil Code. In *Cortelyou vs. Baker*, *supra* (9), the court said: "The kind of property therein disclosed shows that it was intended to apply to a mine in the ordinary meaning of the term, such as a quartz or placer mine. While the development and production of petroleum is for some purposes classed as mining (*Miller vs. Chrisman*, 140 Cal. 440, 73 Pac. 103, 74 Pac. 441), we think this section was not intended to apply to oil operations."

¹¹ *Watterson vs. Cruse*, *supra* (7); *Son vs. Adamson*, *supra* (9).

¹² *Merritt vs. Judd*, *supra* (7); *Roseville Co. vs. Iowa Co.*, 15 Colo. 29, 24 Pac. 920. The authorities clearly distinguish between the word "improvements" and the word "fixtures," holding that under the former term much will pass which would be excluded under the latter. Where the contract provides that the owner shall retake possession upon default the term "improvements" would seem to mean improvements of the realty; that is to say, such things as are placed thereon by the way of betterment which are of a permanent nature and which add to the value of the property. This would include buildings and structures of every kind; and also such machinery as was placed thereon of a permanent nature and which tended to increase the value of the property for the purpose for which it was used. Much can pass thereunder which, strictly speaking, can not be denominated fixtures and which in the absence of such a condition might be taken away. *Siegloch vs. Iroquois Co.*, 106 Wash. 622, 181 Pac. 51; see, also, *Conde vs. Sweeney*, *supra* (7); and see *American Fork Co.*, 291 Fed. 746. The object in placing machinery and fixtures on the land is to enable the lessees to develop the leased property. It is for the benefit of the lessees, and not to enhance the value of the land by permanent improvements thereon. Engines, derricks, oil tanks, casing and pipes are not permanent improvements. Engines, derricks, and do not, upon the forfeiture or other termination of the lease, necessarily vest in the lessor. *Gartland vs. Hickman*, 56 W. Va. 85, 49 S. E. 14.

¹³ *Locke vs. Russell*, 75 W. Va. 602, 84 S. E. 498; *Babb vs. Parker Co.*, 252 Pa. St. 26, 97 Atl. 114; see *Hammett Co. vs. Gypsy Co.* — Okla. —, 218 Pac. 501. Casing head gas is a component part of oil. It is not made from dry gas. It is a product of wet gas which exists only with oil. *Twin Hills Co. vs. Bradford Corporation*, 264 Fed. 440. For a case involving the method of manufacturing gasoline from casing head gas, see *Hammett Co. vs. Gypsy Co.*, *supra*.

¹⁴ *Prichard vs. Freeland Co.*, 80 W. Va. 787, 84 S. E. 945; see *Hammett Co. vs. Gypsy Co.*, *supra* (13).

§ 9. Good Clean Hole.

As applied to oil well drilling a "good clean hole" is one free from those things the presence of which would render the well incapable of use as a well.¹⁵

§ 10. Kill.

The word "kill" as applied to an oil or gas well means to shut off the flow of oil or gas temporarily or to destroy the well entirely so that neither oil nor gas can flow.¹⁶

§ 11. Minerals *Ferae Naturae*.

Water and oil, and still more gas, may be classed as "minerals *ferae naturae*."¹⁷

§ 12. Natural Gas.

Natural gas is a fluid mineral substance, subterranean in its origin and location, possessing in a restricted degree the properties of underground waters, and resembling water in some of its habits. Unlike water it is not generally distributed. Its physical occurrence is in limited quantities only within circumscribed areas of greater or less extent. But the difference between natural gas and underground waters, whether flowing in channels or percolating the earth, is so marked that the principles which the courts apply to questions relating to the latter are not adapted to the adjustment of the difficulties arising from conflicting interests in the former.¹⁸

¹⁵ Bain vs. White, 256 Fed. 432. A contract to drill an oil well provided that it should be completed to a certain prescribed depth and "shall be a good, clean hole." When the well reached the contracted depth a piece of pipe had been left in such condition that either the withdrawal of the drill stem or the mere lapse of a short period of time would result in the hole being obstructed by the pipe. By a "good, clean hole" is not to be understood one which is free from mud, but one which is free from those things which would render the hole incapable of the uses for which it was designed. Under these circumstances when the well was tendered by the driller for measurement the conditions were such that it did not meet the requirements of the contract. Bain vs. White, *supra*; see Gates vs. Little Fay Co., 105 Kan. 191, 132 Pac. 184.

¹⁶ Department vs. Louisiana Co., 144 La. 962, 181 So. 454.

¹⁷ Jones vs. Forest Co., 194 Pa. St. 379, 44 Atl. 1074; see Manufacturers' Co. vs. Indiana Co., 155 Ind. 545, 58 N. E. 851. For a discussion of the analogy between animals *ferae naturae* and mineral deposits of oil and gas, see Ohio Oil Co. vs. State, 177 U. S. 190; Dunlap vs. Jackson, — Okla. —, 219 Pac. 314.

¹⁸ Manufacturing Co. vs. Indiana Co., *supra* (17). Natural gas is found at pronounced depths in porous strata—usually sand rock—constituting a natural reservoir and is brought to the surface and reduced to possession through wells drilled into the containing strata. When a surface owner reduces it to possession he becomes its owner and it becomes a subject of commerce, like any product of the forest, field or mine. Penn. vs. W. Virginia, 262 U. S. 586; City of Erie vs. Public Service Com., — Pa. St. —, 123 Atl. 475. Natural gas is a commodity as much so as coal, and like coal it is a fuel and as such is used for domestic and industrial purposes. It is a subject marketable, either within the state wherein it is produced or in the state to which it is transported. Suttle vs. Hope, 82 W. Va., 729, 97 S. E. 429. Natural gas is land. Haskell vs. Sutton, 53 W. Va. 206, 44 S. E. 533; Reynolds vs. Whitescarver, 66 W. Va. 392, 66 S. E. 518. The owner of the land owns everything that goes to make up the realty. Natural gas beneath the surface is a part of the realty and the owner of the land is the owner of the gas. By reason of the fugitive character of natural gas the landowner is the owner of the gas only in a qualified sense. He owns it only while it remains beneath the surface of his land. If by its natural tendency to flow it escapes to the lands of an adjoining proprietor such ownership then ceases. But this qualified ownership in the gas authorizes the owner of the land to reduce it to possession by sinking wells upon his own land and thus permit it by natural means or its own ordinary pressure to flow to the surface and into a receptacle he may prepare to receive the same. When thus reduced to possession through a well and regardless of whether it came from beneath his own land or remotely from the lands of an adjoining proprietor, the natural gas becomes personal property, the absolute ownership of which is in the owner of the land upon which it is produced. Fairbanks vs. Warrum, 56 Ind. A. 337, 86 S. E. 883. Operations for gas can not be measured by the same rule applied in the same manner as in the case of operations for oil. The peculiar characteristics of the business of producing and transporting gas being such as to distinguish it for some purposes from operations for oil. McKnight vs. Manufacturing Co., 146 Pa. St. 185, 23 Atl. 164. The rule of property right in natural gas and oil in all the states save Indiana is stated in Brown vs. Spilman, 155 U. S. 665; see Gas Co. vs. Rankin, 68 Mont. 372, 207 Pac. 998.

§ 13. Net Profits and Net Proceeds.

An oil and gas lease provided that the net profits were to be determined by deduction from the gross income only the royalties and operating expenses, as distinguished and considered apart from "capital expenses." A modifying clause providing for a change in the payment of royalty based on the "net proceeds" provided for in the modifying clause was not dependent upon the cost of capitalization but only upon the sum total of royalties and operating expenses and in estimating the net proceeds the lessee could not deduct capital expenses in addition to operating expenses.¹⁹

§ 14. Oil.

The word "oil" as used in an oil and gas lease, has always been referred to by the courts and understood to designate the oil produced from a well, or crude petroleum in its natural state.²⁰

§ 15. Oil and Gas.

Oil and gas are minerals, and in their places are real estate and part of the land.²¹

§ 16. Oil as Personal Property.

Oil in place is a part of the land in which it is found or from which it is obtained, but when brought to the surface or reduced to possession, it ceases to be real estate and becomes personal property, and as such may be subject to partition among its joint owners.²²

§ 17. Oil Operations.

The courts take judicial notice of the fact that oil and natural gas are mined by means of deep wells drilled into the earth.²³

¹⁹ Nathan vs. Porter, 36 Cal. A. 356, 172 Pac. 170. The word "profits" signifies an excess of the value of advances, People vs. Savings Union, 72 Cal. 199, 130 Pac. 887, or as the word is defined in Connolly vs. Davidson, 15 Minn. 519, it means the excess of receipts over expenditures; or, in Eyster vs. Centennial Board, 94 U. S. 500, it is the receipts of a business deducting current expenses; it is the equivalent to net receipts; see, also, Blanck vs. Pioneer Co., 93 Wash. 26, 159 Pac. 1077.

²⁰ Hammett Co. vs. Gypsy Co., *supra* ¹⁹. Oil shale is a valuable mineral deposit and a source of petroleum oil. Reed vs. Doyle, 47 L. D. 548; see, also, McCombs vs. Stephenson, 154 Ala. 109, 44 So. 867; Dean vs. Wyoming Co., 21 Wyo. 133, 128 Pac. 881.

²¹ Kennedy vs. Hicks, 180 Ky. 562, 203 S. W. 318; McKinney vs. C. K. G. Co., 134 Ky. 239, 120 S. W. 314; DeMoss vs. Sample, 143 La. 243, 78 So. 482; Rich vs. Doneghy, — Okla. —, 177 Pac. 86; see, also, Daughetee vs. Ohio Co., 263 Ill. 518, 105 N. E. 308. Oil and gas within the ground are minerals. The fact that they have attributes not common to other minerals because of their fugitive nature or vagrant habits, and the disposition to percolate, and the possibility of their escape from beneath one part of the surface to another, does not remove them from the class of minerals. Texas Co. vs. Daugherty, 107 Tex. C. A., 176 S. W. 719; see, also, United Co. vs. Meredith, — Tex. C. A. —, 258 S. W. 550. But oil and gas are not synonymous terms. A lease of oil does not embrace the right to take the gas and vice versa. While they usually are found together, or near to each other in the same strata, though not always so, they are regarded as separate minerals, or mineral substances. Of course either would be a proper subject of reservation in a lease of the land. Murphy vs. Van Voorhis, — W. Va. —, 119 S. E. 297; see, also, Arnold vs. Garnett, 103 Kan. 477, 174 Pac. 1027; Palmer vs. Truby, 136 Pa. St. 563, 20 Atl. 516. Oil and gas are furtive, migratory and self-transmissive minerals, and because of these characteristics or qualities contracts and rights relating thereto require the application of principles different in many respects from those applicable to other minerals that are not affected with such characteristics. Reckard vs. Cowley, 202 Ala. 337, 80 So. 419; see Kimbley vs. Luckey, 72 Okla. —, 179 Pac. 928.

²² Warren vs. Boggs, 83 W. Va. 89, 97 S. E. 589; see, also, Kimbley vs. Luckey, *supra* ²¹.

²³ Kemp vs. Barr Co., 103 Kan. 595, 175 Pac. 988. Nothing is more uncertain than the production of oil wells and any representation as to future production is a mere expression of opinion as to exploitation and probabilities and will not constitute fraud even though it should turn out to be untrue. Engemann vs. Allan, — Ky. —, 257 S. W. 25; see, also, Cooper vs. Gastliger, — Pa. St. —, 123 Atl. 506.

§ 18. Oil Seepage.

While it is possible that at times oil may be found issuing from the surface of the ground, known in practice as seepage, in which case discovery may be made without difficulty or expense, it is a matter of common knowledge that almost always drilling is essential to such discovery, and in many sections drilling to a great depth, involving heavy cost.²⁴

§ 19. Oil Territory.

Oil territory does not necessarily imply a real issue of fact as the phrase has no fixed nor well-recognized meaning and may well be used in one sense and understood in another. But it may mean territory where the observable geological conditions are such as to justify expenditures in prospecting by those who are able to take the chance.²⁵

§ 20. Oil Well.

An oil well is a "mine."²⁶

§ 21. One-Eighth.

An instrument conveying the oil and gas under certain land but reserving title to one-eighth of the oil and gas is a covenant running with the land.²⁷

§ 22. Original Package.

The term "original package" properly is applied to natural gas transported by pipe lines.²⁸

§ 23. Paying Quantities.

The phrase "paying quantity" is to be construed with reference to

²⁴ *Con. Mutual Oil Co. vs. U. S.*, 245 Fed. 525; see *Nevada Sierra Co. vs. Home Oil Co.*, 98 Fed. 673; *Butte Oil Co.*, 40 L. D. 602; *Miller vs. Chrisman*, *supra* (10); *Bay vs. Oklahoma Co.*, 13 Okla. 425, 73 Pac. 963.

²⁵ *S. P. Co. vs. U. S.*, 249 Fed. 786. Oil fields become definitely defined by boundaries established through the exploration of operators so that those who are engaged in operating or speculating with reference to them rely upon the defined area as a known fact. The expression "proven territory" has a fixed meaning in the business. It means territory so situated with reference to known producing wells as to establish the general opinion that, because of its location in relation to them, oil is contained in it. Of course, no particular area can be known to contain oil until the wells actually are drilled and the oil thus is discovered. Such are the uncertainty, irregularity, and elusiveness which characterize the deposit of oil lying beneath the surface in the average oil field that barren areas are not infrequently found to exist in what is regarded as proved territory. *Minchew vs. Morris*, — Tex. C. A.—, 241 S. W. 215.

²⁶ *Mid-Northern Co. vs. Walker*, 65 Mont. 414, 211 Pac. 353; see *Burke vs. S. P. R. Co.*, 234 U. S. 907; *Escott vs. Crescent City Co.*, 56 Or. 190, 106 Pac. 452. But see *Hollingsworth vs. Berry*, 107 Kan. 544, 192 Pac. 763; *J. M. Guffey Co. vs. Murrel*, 127 La. 483, 53 So. 705; *Kreps vs. Brady*, 37 Okla. 754, 133 Pac. 216; *Carter vs. Phillips*, 88 Okla. 202, 212 Pac. 747. In the case of *J. M. Guffey Co. vs. Murrel*, the court said: "A productive oil well or aggregation of them is always universally and invariably known as an 'oil field.' Whoever heard of such being called a mine? If an oil well was a 'mine' in the usual signification of the word, surely sometime, somewhere, some intelligent person would be heard to designate it by that term; but it is never done. Now a 'mining operation' must certainly be something having to do with a mine, and if an oil well is never known in the ordinary and customary use of language as a 'mine' then neither the making nor operating of one could possibly be considered a mining operation in the ordinary signification of the word. He who works in a mine is termed a 'miner,' but no one ever heard of a laborer at an oil well being called a 'miner.' It is shown by the testimony that an oil well is too small for a man to get into, even if such was necessary or desirable, which it is not. We think it absolutely clear that the words 'mine' or 'mining operation' never refer to oil wells or oil production in ordinary parlance."

²⁷ *Pierce Ass'n vs. Woodrum*, — Tex. C. A.—, 188 S. W. 245; see *Spence vs. Lucas*, 138 La. 763, 70 So. 796; and see *Con. Arizona Co. vs. Hinchman*, 212 Fed. 813.

²⁸ *W. Virginia Co. vs. Towers*, 134 Md. 137, 106 Atl. 265; *Landon vs. Public Utilities Co.*, 249 U. S. 236; s. c. 242 Fed. 658, 245 Fed. 950; *State vs. Flannelly*, 96 Kan. 372, 152 Pac. 22; see 26 A. L. R. 971, note.

the operator, and by his judgment when exercised in good faith.²⁹ There must also be taken into consideration the distance to market and the expense of marketing in determining whether oil can be marketed at a reasonable profit.³⁰ This phrase is also defined as meaning in sufficient quantities to pay a reasonable profit on the necessary sum required to be expended, including the cost of drilling, equipment, and operation of the well.³¹ It may be defined in a lease, by the parties thereto.³² As a general rule the determination of the lessee, acting in good faith, is the controlling factor.³³

§ 24. Rent and Royalty.

In mining leases the words "rent" and "royalty" are used interchangeably to convey the same meaning.³⁴

§ 25. Royalty.

The word "royalty" as used in an oil and gas lease, generally refers to a share of the product or profit reserved by the owner for permitting another to use the property.³⁵ A lease by which the owner or lessor grants to the lessee the privilege of mining and operating the land in consideration of the payment of a certain stipulated royalty on the mineral produced, creates the relation of landlord and tenant and when that relation is created whatever is paid for the occupation and use of the premises, whether it be in money or kind, is equally in substance rent, and under such circumstances the royalties received are rentals.³⁶

§ 26. Surface.

The word "surface" in mining controversies means that part of the earth or geologic section lying over the minerals in question, unless otherwise defined by the deed or conveyance. It is not merely the top of the glacial drift, soil, or the agricultural surface. The owner of a

²⁹ *Young vs. Forest Co.*, 194 Pa. St. 243, 45 Atl. 121; *Summerville vs. Apollo Co.*, 207 Pa. St. 334, 56 Atl. 876; *Manhattan Co. vs. Carrell*, 164 Ind. 526, 73 N. E. 1084; *Hennessy vs. Junction Oil Co.*, 75 Okla. 220, 182 Pac. 666; see *Tucker vs. Watts*, 25 Ohio C. C. 320.

³⁰ *Iams vs. Carnegie Co.*, 194 Pa. St. 72, 45 Atl. 54.

³¹ *Keechi Co. vs. Smith*, 81 Okla. 267, 198 Pac. 588; see, also, *Aycock vs. Paraffine Co.*, — Tex. C. A. —, 210 S. W. 851; *Lowther Co. vs. Miller-Sibley Co.*, 53 W. Va. 508, 44 S. E. 433; *Summerville vs. Apollo Co.*, *supra*.⁽²⁹⁾

³² *McLean vs. Kishi*. — Tex. C. A. —, 173 S. W. 502; see *Hennessy vs. Junction Oil Co.*, *supra* ⁽²⁹⁾; *Lowther Co. vs. Miller Co.*, *supra* ⁽¹¹⁾.

³³ *Barbour Co. vs. Tompkins*, 81 W. Va. 116, 93 S. E. 1038; *Hennessy vs. Junction Oil Co.*, *supra* ⁽²⁹⁾; *Summerville vs. Apollo Co.*, *supra* ⁽²⁹⁾. If a well, being down, pays a profit, even a small one, over the operating expenses, it is producing in "paying quantity," though it may never repay its cost, and the operation as a whole may result in a loss. Few wells, except the very largest, repay cost under a considerable time, and many never do; but that is no reason why the first loss should not be reduced by profits, however small, in continuing to operate. The phrase "paying quantities," therefore, is to be construed with reference to the operator, and by his judgment when exercised in good faith. *Young vs. Forest Co.*, *supra* ⁽²⁹⁾; *Lowther Co. vs. Miller-Sibley Co.*, *supra* ⁽³¹⁾; see *Reynolds vs. White Plains Co.*, — Ky. —, 250 S. W. 975.

³⁴ *Nelson vs. Republic Co.*, 240 Fed. 293; *Campbell vs. Lynch*, 81 W. Va. 374, 94 S. E. 739.

³⁵ *Saulsberry vs. Saulsberry*, 162 Ky. 486, 172 S. W. 932.

³⁶ *Von Baumbach vs. Sargent Co.*, 242 U. S. 503. Under an oil and gas contract giving the privilege of drilling and developing the land for oil, until severance takes place, the lessee has no title and on severance and not earlier when the royalty in oil is payable. At that time the oil or gas is personal property after alienation or disposition of which no deed or other solemn instrument of conveyance is necessary. It is personal property in the hands of the lessee. He has bound himself to deliver a portion of it called royalty to the lessor as rent in kind for occupation, use, and operation of the lessor's land. The royalty is a rent susceptible of division as if it were a rent payable in money. While the lease does not actually pass the title to the oil or gas, it confers a right to take it. Where there is a severance of or a partition of the leased lands, the divided tracts go into the hands of their owners subject to such right, whether they are acquired by deed, will, or a decree of partition. *Campbell vs. Lynch*, *supra* ⁽³⁰⁾.

higher stratum is entitled to the same rights to surface support as the actual surface owner.³⁷ When the landowner grants the underlying minerals, reserving the surface to himself, his grantee is entitled only to so much of the mineral as he can extract without injury to the superincumbent soil.³⁸

§ 27. Test Well.

A test well is one that determines not only the presence of petroleum oil, but its commercial value, considering its abundance and accessibility. The information resulting should be such as a prudent and experienced investor would desire to know before expending his capital in labor, or improvements for the profitable working of the property.³⁹

§ 28. Wild Cat Territory.

The term "wild cat territory" is applied to land which is not proven but is thought to be susceptible of development as petroleum oil and natural gas producing land.⁴⁰

³⁷ *Marquette Co. vs. Ogelsby Co.*, 253 Fed. 111.

³⁸ *Id.*, *supra* (37); see *Lloyd vs. Catlin Co.*, 210 Ill. 460, 71 N. E. 335; *Coleman vs. Chadwick*, 8 Pa. St. 81; *Morner vs. Watson*, 79 Pa. St. 251; *Zinc Co. vs. Franklinite Co.*, 13 N. J. Eq. 342; *Harris vs. Ryding*, 5 Mees. & Wel. 59; *Smart vs. Morton*, 5 Ellis & Black 30; compare *Oberly vs. Frick Co.*, 262 Pa. St. 83; 104 Atl. 864. A lessee of the service has no right under his lease to commit waste by the removal of oil. *Isom vs. Rex Crude Oil Co.*, 147 Cal. 659, 82 Pac. 317.

³⁹ *Petroleum Co. vs. Coal Co.*, 89 Tenn. 381, 18 S. W. 65; *Texas Co. vs. Davis*, — Tex. —, 254 S. W. 307. The authorities are uniform that where there is no provision in a lease providing what shall be done if the test well proves dry, there is an implied obligation on the lessee to proceed further with the exploration and development of the land with reasonable diligence according to the usual course of business. A failure to do so amounts to an abandonment, which will sustain a re-entry by the lessor. *Aye vs. Philadelphia Co.*, 193 Pa. St. 451, 44 Atl. 555. An oil and gas lease provided that it should remain in force for the term of one year from its date and as long thereafter as oil or gas is produced from the premises by the lessee; and providing that "if said territory proves to be productive, then the party of the second part to complete this contract shall drill as many as eight wells on said premises, and said wells shall be drilled with due diligence and dispatch having in view the interest of both parties thereto, and so to produce all the oil or gas that may be reasonably produced from said premises." The lessee proceeded immediately and within thirty days drilled a productive well upon the leased premises. It then became his duty to proceed immediately to drill the eight wells as contemplated by the lease. The word "if," as used in the quoted clause, means "when" and the word "then" used in the quoted clause, is an adverb of time and means "at the time," that is, at the time the territory proved productive by drilling of the test well. It was then the duty of the lessee to drill as many as eight wells upon the leased premises and, within a year from the date of the lease, as a condition precedent to the extension of the lease beyond the term of one year. Whether such wells were by the lessee drilled with due diligence and dispatch, having in view the interest of both parties to the lease, and so as to produce all the oil and gas that may reasonably be produced from the premises as required by the lease, is a question of fact to be determined in connection with all the circumstances attending the operations. The fact that a test well was profitable and that there was, at its conclusion, a profitable market, make the failure of the lessee to drill as many as eight wells with due diligence sufficient ground for the forfeiture of the lease on the part of the lessor. *Paraffine Oil Co. vs. Cruce*, 63 Okla. 95, 162 Pac. 716; *Lavery vs. Mid-Continent Co.*, 62 Okla. 206, 162 Pac. 737.

§ 1. Introductory.

It is immaterial whether the instrument giving rights and privileges to take oil and gas is called a lease, license, sale, contract, grant, deed or conveyance, a right to land, or other name. It is the language used aside from the terms used therein which will determine its legal effect.¹

¹ *Gulf Co. vs. Hayne*, 138 La. 555, 70 So. 509. In estimating the language which constitutes a lease, the form of words used is of no consequence. It is not necessary that the term "lease" should be used. Whatever is equivalent will be equally available. If the word assume the form of a license, covenant, or agreement, and the other requisites of a lease are present, they will be sufficient. *Pelton vs. Minah*, 11 Mont. 281, 28 Pac. 310; see, also, *Hudepohl vs. Liberty Co.*, 80 Cal. 553, 22 Pac. 339; *Michaelak vs. New Almaden Co.*, 42 Cal. A. 741, 184 Pac. 56. For a conjoint deed and lease see *Wright vs. Carter Oil Co.*, — Okla. —, 223 Pac. 835. An oil and gas lease, whether a chattel real, an incorporeal hereditament, or whatever termed, is a right or interest relating to real estate, and while it does not rise to the dignity of an estate prior to entry by a lessee, yet it is property, and as such is subject to transfer and sale. *Shaffer vs. Marks*, 241 Fed. 139. A lease granted to the lessee the exclusive right to sink shafts, to drill wells, and to extract any and all kinds of minerals, especially petroleum, from the land for a term of twenty years unless sooner forfeited. The lessee agreed to incorporate a company for the operation and development of the leased property before commencement of active operations on the property and to commence active work of boring for oil not later than a specified date, and to prosecute such labors diligently. The court held that the lease was a lease of the land itself and not an ordinary oil and gas lease by which the lessor remains in possession and control of the land, giving the mere right of entry to the lessee to begin the prosecution of search for oil; and the discovery of oil was not a prerequisite to the existence of a cause of action on the part of the lessee or its assigns for the failure of the lessor to place the lessee in possession of the property. *Kline vs. Guaranty Oil Co.*, 167 Cal. 476, 140 Pac. 1; *Allan vs. Guaranty Co.*, 176 Cal. 421, 168 Pac. 884, A. C. 15 B. 807, note; see *Cooke vs. Gulf Co.*, 135 La. 609, 65 So. 758. A contract or lease of land for the exploration of land for minerals, oil and gas, although designated a sale by the parties, was a grant of an exclusive right to search for, take and appropriate the minerals mentioned in the contract, and is in effect a lease of the land described for mining purposes. *DeMoss vs. Sample*, 143 La. 243, 78 So. 482.

The term "lease" is applied to such instruments merely through habit and for convenience. Such an instrument creates no interest in land but simply a kind of license.² It creates an incorporeal hereditament, a right growing out of or concerning or annexed to a corporeal thing, but not the substance of the thing itself.³

§ 2. Nature of Lease.

Because of the peculiar nature of petroleum oil and natural gas, leases for land of that character are governed by different principles than leases of other classes of real property.⁴ The reason is the danger of loss to the landowner from draining his oil away by wells sunk on the surrounding lands; and such leases are construed most strictly against the lessee and in favor of the lessor, especially where the lessee may delay performance indefinitely,⁵ and the law will imply conditions to attain the end sought by the execution of such lease.⁶

² *Huston vs. Cox*, 103 Kan. 73, 172 Pac. 972; but see *Shaffer vs. Marks*, *supra* (1); *McKean Oil Co. vs. Walcott*, 254 Pa. St. 323, 98 Atl. 955; *Ewart vs. Robinson*, 289 Fed. 140; *Exchange Bank vs. Head*, 155 La. —, 99 So. 272. "In its inception at least, and before oil is found on the leased property, an ordinary oil lease has no effect on the title to the premises covered by the lease. It occupies a position differing no appreciable degree from any other contract, and upon its breach in a material part, may be canceled in a similar manner. The title, if any, transferred by an oil lease is inchoate in its nature. At the outset the purpose of the instrument is not to effect a conveyance of any interest in the land, but to permit only a temporary possession thereof for the purposes of exploration. If the quest be unsuccessful, no estate vests in the licensee and whatever rights may have inured to the so-called lessee end when the search is abandoned. *Payne vs. Neuval*, 155 Cal. 46, 99 Pac. 476; *Ventura Oil Co. vs. Fretts*, 152 Pa. St. 451, 25 Atl. 722; *Pittsburg Vitrified, etc., Co. vs. Bailey*, 76 Kan. 42, 90 Pac. 803; *Kelly vs. Keys*, 213 Pa. St. 295, 62 Atl. 911; *Steelsmith vs. Gartlan*, 45 W. Va. 27, 29 N. E. 978; notes, 26 L. R. A. (N. S.) 619; 2 Ann. Cas. 446, 448; *Thornton on Oil and Gas* (2d ed.), 87." *Taylor vs. Hamilton*, 44 Cal. A. D. 159.

³ *Gulf Co. vs. Hayne*, *supra* (1). A grant by lease of oil and gas when they are in the ground is a grant, not of the oil and gas in the ground, but of such part of the oil and gas as the lessee finds and reduces to possession. *Parker vs. Reilly*, 243 Fed. 42. The mere fact that oil and gas leases are not a grant of the oil or gas or mineral in the ground is not a finding that they may not, by their terms, convey an interest in the land, or grant more than a mere license or incorporeal hereditament. *Ewert vs. Robinson*, *supra* (2); *Von Baumbach vs. Sargent Co.*, 242 U. S. 503; *Webb vs. O'Brien*, 263 U. S. 313; *Ex parte Okahara*, — Cal. —, 216 Pac. 614. A lessee acquires no title to oil until it is taken from the ground. *Mexican Oil Co. vs. Compania*, 281 Fed. 148.

⁴ *Acme Co. vs. Williams*, 140 Cal. 691, 74 Pac. 296; see *Becker vs. Submarine Oil Co.*, 55 Cal. A. 703, 204 Pac. 245; *Owens vs. Corsicana Co.*, — Tex. C. A. —, 169 S. W. 192; *Leonard vs. Caruthers*, — Tex. C. A. —, 236 S. W. 189.

⁵ *Huggins vs. Daley*, 99 Fed. 606; *Warner vs. Page*, 59 Okla. 259, 159 Pac. 264. Where the lease requires the lessee to begin a well within a time certain or pay a stipulated rent for each year such work was delayed, the lessee can not refuse to begin the development of the property for an unreasonable time and extend the lease indefinitely by the payment of a mere nominal rent. *Warren Co. vs. Gilliam*, 182 Ky. 807, 207 S. W. 698; *Hughes vs. Parsons*, 183 Ky. 584, 209 S. W. 853; see *Bristow vs. Christine Co.*, 129 La. 312, 71 So. 521. Where the lease does not specify the time within which the well or wells shall be completed the law will imply a reasonable time, and it is too clear to need argument that the lessee could in no event be held responsible until such reasonable time had elapsed. *Barquin vs. Hall Co.*, 28 Wyo. 168, 201 Pac. 352.

⁶ *Acme Co. vs. Williams*, *supra* (1). Where the language in an oil and gas lease was as much that of the lessee as that of the lessor, the lease will be construed most strongly against the lessee in order to provoke development and prevent delay and unproductiveness, looking to all parts of the instrument in the light of the facts in connection with the operation. *Paraffine Co. vs. Cruce*, 63 Okla. 95, 162 Pac. 716; see, also, *Hughes vs. Busseyville Co.*, 180 Ky. 545, 203 S. W. 515. Where some causes of forfeiture are expressly mentioned none others can be implied. *Grubb vs. McAfee*, 109 Tex. C. A. 383, 212 S. W. 464. Where the terms of an oil and gas lease are clear and explicit, and the meaning is not doubtful, and there is no latent ambiguity, the lease can not be varied by the subsequent conduct of the parties or surrounding circumstances. The parties must be deemed to be bound by the lease, regardless of the results produced. *Jameson vs. Chanstor-Canfield Co.*, 176 Cal. 1, 167 Pac. 372; compare *Kelley vs. Harris*, 62 Okla. 236, 162 Pac. 221.

§ 3. Time as Essence.

In an oil and gas lease time, ordinarily, is of the essence of the contract. A proper construction of the language used will not limit the lessee to the particular term mentioned in the lease where he has demonstrated that the leased land is underlaid with oil or gas and that he is proceeding with all diligence in an efficient manner to produce the oil or gas therefrom in paying quantities.⁷

§ 4. Mutuality.

An oil or gas lease for a stated term of years or as long as oil or gas is produced and providing that operations should be commenced within a stated period, or, if not, for the payment of a certain stated annual rental, and giving the lessor a certain royalty on the oil and gas produced, is not void for want of mutuality. It is not a unilateral contract.⁸

§ 5. Surrender Clause.

The presence of the surrender clause in the lease does not render the

⁷ Ohio Oil Co. vs. Greenleaf, 84 W. Va. 67, 199 S. E. 274. The parties expressly stipulated in the lease that it was "the essence of the contract" that drilling should be commenced "within a reasonable time" and prosecuted with diligence. They thus emphasized a condition which is inherent in all oil and gas leases. So much is time considered to be an "essence" of such leases that a court is without power or right to grant an extension for performance. Murray vs. Barnhart, 117 La. 1023, 42 So. 489; Woodley vs. Hollingsworth, 154 La. —, 98 So. 87. The term "reasonable time" is a relative one, and the meaning is dependent upon the circumstances of the particular case in which the court is called upon to define it. Woodley vs. Hollingsworth, *supra*. Where the lease did not provide that time was of essence, a slight delay in monthly payments due under the lease, did not operate to forfeit the lease. Jackson vs. Twin States Co., — Okla. —, 218 Pac. 325. The right to insist upon time as the essence of a contract may be waived expressly or by necessary implication. Craig vs. Thompson, — Pa. St. —, 121 Atl. 408; Garfield Co. vs. Champlin, 78 Okla. 91, 189 Pac. 214; Pettit vs. Double-O Co., — Okla. —, 198 Pac. 616; see also, Virginia Co. vs. Haeder, 32 Ida. 240, 181 Pac. 141. Even though the contract contain no express provision making time the essence thereof, where it appears that such was within the contemplation of the parties, the courts will so construe the contract. Taylor vs. Hamilton, *supra* (2); see Whitman vs. Hall, 41 Cal. A. D. 472.

⁸ Hughes vs. Parsons, *supra* (5); Ohio Oil Co. vs. Irvin Co., 184 Ky. 517, 212 S. E. 130. A unilateral contract is one in which there is a promise on one side only, the consideration on the other side being executed. Rich vs. Doneghey, 72 Okla. —, 177 Pac. 86. Such contracts are construed strictly. Bearman vs. Dux Co., 64 Okla. 147, 166 Pac. 199; see Northwestern Co. vs. Branine, 71 Okla. —, 175 Pac. 533. A land owner executed an oil and gas lease for certain lands for a term of five years for a cash consideration of two hundred and forty dollars. The lessee agreed to pay to the lessor one-eighth of the oil produced and to pay a stipulated sum per annum for each gas well. The lessee was to complete a well on the premises within twelve months from the date of the lease or pay two hundred and forty dollars quarterly in advance for each year such completion was delayed. The lease contained a provision that upon the payment of one dollar at any time to the lessor, the lessee should have the right to surrender the lease for cancellation. Such a lease is not unilateral and is not void for want of mutuality. The cash bonus supports each and all the covenants of the lease, and although no well has been commenced on the premises, the lessor had not the option to refuse the timely tender of payments and terminate the lease. Mag-nolia Co. vs. Saylor, 72 Okla. —, 180 Pac. 861; see Northwestern Co. vs. Branine, *supra*; Rich vs. Doneghey, *supra*; see, also, Shaffer vs. Marks, *supra* (6). For instances of want of mutuality see Davis vs. Riddle, 25 Colo. A. 162, 136 Pac. 551; Caddo Co. vs. Producers' Co., 134 La. 701, 64 So. 684.

lease void for want of mutuality nor does it confer on the lessor the right to terminate the lease at will.⁹

§ 6. Construction of Surrender Clause.

The surrender clause in oil and gas leases will be construed strictly in favor of the landowner, the party who is bound, and against the lessee, the party who is not bound.¹⁰

§ 7. "Unless Lease."

Most of the oil and gas leases fall into two classes, commonly designated as the "unless lease" and the "or lease." The leases belonging to these respective classes possess such marked distinctions in the rights and liabilities that these distinctions should not be lost sight of in the construction of such a lease. Under an "unless lease," the lessee, so long as he pays the rentals in the manner provided, has an option to

⁹ Carter Oil Co. vs. Tiffin, 74 Okla. —, 176 Pac. 912; Gypsy Oil Co. vs. Van Slyke, — Okla. —, 178 Pac. 683; Northwestern Oil Co vs. Branine, *supra* ⁽⁹⁾; see Ewart vs. Robinson, *supra* ⁽³⁾. The option to surrender an oil and gas lease can not be declared inequitable. In case it was not exercised the lessee would be bound by his covenants. If exercised the lessor would be free to deal with the premises as he chose. Rechar'd vs. Cowley, 202 Ala. 337, 80 So. 419; see, generally, Eastern Oil Co. vs. Beatty, — Okla. —, 177 Pac. 104; Rich vs. Doneghey, *supra* ⁽⁶⁾; Riddle vs. Keechi, — Okla. —, 176 Pac. 737, 177 Pac. 104; but see Advance Oil Co. vs. Hunt, 66 Ind. A. 228, 116 N. E. 340, in which case it is said: That an oil and gas lease provided that the lessee was to complete a well within three months from its date or pay a stipulated rental until a well should be completed. The lease gave the lessee the right at any time on the payment of one dollar to surrender the lease for cancellation and thereafter all payments and liabilities should cease and terminate. Such a lease or contract is wanting in mutuality because, for a nominal sum, the lessee is given the right to annul it at any time and end all liability thereafter accruing under the lease. The lessee of such a lease can not enforce its terms by injunction as courts refuse to grant equitable relief where, if granted, one of them may nullify so taken by the exercise of a discretionary right which either the law or his contract has conferred upon him. An oil and gas lease contained the usual surrender clause and contained this further provision: "This surrender clause and the option herein reserved to the lessee shall cease and become absolutely inoperative immediately and concurrently with the institution of any suit in any of its terms." Such a provision is valid and binding, and when the lessee filed a suit to enjoin the lessor from re-leasing the premises and further interfering with his rights under the lease the surrender clause became inoperative and the lessee thereby became bound to perform the covenants of the lease and is entitled to be protected in his rights under the lease. Pucini vs. Baumgarner, — Okla. —, 175 Pac. 537. Cited in Brunson vs. Carter Oil Co., 259 Fed. 665; see, also, Rich vs. Doneghey, *supra* ⁽⁶⁾; and see Eastern Oil Co. vs. Beatty, *supra* ⁽⁶⁾. A lessor may refuse to accept a surrender of an oil and gas lease though the lease contains a clause giving the lessee the right to surrender, when the lessee denies liability on an unperformed covenant of the lease to be performed by him in lieu of development, but in postponement of operations. The lessor's refusal is justified when the lessee denies liability on the covenant broken, and where the surrender expressly states that the acceptance thereof will operate as a waiver of performance of the covenants and conditions broken. Hefner vs. Light Co., 77 W. Va., 217, 87 S. E. 206.

¹⁰ Shaffer vs. Marks, *supra* ⁽⁹⁾; see, also, Ewart vs. Robinson, *supra* ⁽⁹⁾. For reciprocal rights see Melton vs. Cherokee Co., 67 Okla. 247, 170 Pac. 691. An oil and gas lease contained a clause giving the lessee the right to surrender the lease at any time, but provided that the right to surrender should cease and become inoperative upon the institution of any suit by the lessee to enforce any rights under the lease. Such a clause does not prevent a court from enforcing specific performance of the lease at a suit by the lessee, for the reason that the institution of the suit renders the surrender clause ineffective, and the lease is no longer an unilateral contract. Downey vs. Gooch, 240 Fed. 520; but see Hill Oil Co. vs. White, 53 Okla. 748, 157 Pac. 710, in which it is said: that a surrender clause in an oil and gas lease which gives to the lessee the right at any time to surrender and terminate the lease, after which all payments or liabilities should cease and terminate, deprives the lessee of the right of specific performance, directly or indirectly, until he has performed the contract or placed himself in such a position that he might be compelled to perform it on his part. The owner of land under an existing oil and gas lease executed a second lease that contained a clause by the terms of which the lessee could at any time upon the payment of one dollar surrender the premises and relieve himself from any obligation under the lease. This provision makes such a lease unilateral, and is such a one as a court of equity will refuse to enforce, and it will furnish the basis for an action in ejectment or other real action. The lessee in such a lease has no standing to question the validity of the first lease nor to maintain ejectment against the original lessee. Brennan vs. Hunter, 68 Okla. 112, 172 Pac. 49.

continue the lease in force. Such a lease is subject to termination at the will of the lessee, and the privilege may be exercised by a mere failure to pay the stipulated rental at the time due and upon which the lease automatically terminates, and the lessor can not sue under the lease for the rentals; but under such a lease the lessor has not the right to terminate the lease so long as the lessee complies with its terms.¹¹

§ 8. "Or Lease."

Under an "or lease," even when containing a surrender clause, the payment of rentals by the lessee as required is not necessary to keep it alive from time to time, nor does the failure to pay automatically terminate the contract, as under an "unless lease." Where the lessee makes default in the payment of rentals the lessor may waive the forfeiture clause and sue and recover rentals due according to the lease. The lessee may terminate the lease at any time by availing himself of the right to do so contained in the surrender clause, and by paying all the accrued rentals, due at the time of surrender.¹²

§ 9. Implied Covenants.

Implied covenants are those only which, on grounds of legal necessity, the courts may read into the contract for the proper effectuating the manifest intention of the parties.¹³

§ 10. Joint and Several Covenants.

A covenant in an oil and gas lease may be construed to be joint or several according to the interest of the parties appearing upon the face of the lease, if the words are capable of such construction. But the

¹¹ *Northwestern Oil Co. vs. Branine*, *supra* ⁽⁶⁾; *Ireland vs. Chapman*, 87 Okla. 223, 208 Pac. 408. An oil and gas lease containing the "unless" clause confers an optional right upon the lessee, and should be strictly construed in favor of the lessor and against the lessee, and time is of the essence of the contract. *McKinley vs. Feagins*, 82 Okla. 193, 198 Pac. 997; see, generally, *Guffey vs. Smith*, 237 U. S. 101; *Hopkins vs. Zeigler*, 259 Fed. 46; *Leeper vs. Lemon G. Neely Co.*, 293 Fed. 971; *Garfield Oil Co. vs. Champlin*, — Okla. —, 189 Pac. 514; 3 A. L. R. 344, 352; *Thornton's Oil and Gas* (3d Ed.), Secs. 192, 193. An "unless" lease does, by its terms, become null and void when the lessee intentionally fails to make the payment at the time and in the manner stipulated. *Shaffer vs. Marks*, *supra* ⁽¹⁾; see, also, *Brunson vs. Carter Oil Co.*, *supra* ⁽⁶⁾. For a lease which was neither an "unless" nor an "or" lease see *Brennan vs. Hunter*, *supra* ⁽¹⁰⁾.

¹² *Northwestern Oil Co. vs. Branine*, *supra* ⁽⁶⁾. In the case of an "or" surrender clause lease, the lessor can elect as to whether he will cancel and terminate the lease for nonpayment or treat it as continuing in force and collect the stipulated rental. An intentional failure to pay as stipulated, in every case, may be treated as an abandonment of the lease. *Shaffer vs. Marks*, *supra* ⁽¹⁾; see *Healdton Co. vs. Smith*, 80 Okla. 242, 195 Pac. 756; see note 11, *supra*. An "or" lease is one in which the lessee agrees to drill, or in lieu of drilling to pay a rental. *McMillan vs. Philadelphia Co.*, 159 Pa. St. 142, 28 Atl. 220.

¹³ *Allen vs. Colonial Co.*, 92 W. Va. 689, 115 S. E. 842. Leases for oil and gas are subject to the implied covenants that the lessee will do all that is necessary to carry into effect the purposes and objects of the lease. There is an implied covenant, in the absence of an express agreement to begin work within a certain time, to begin the operations within a reasonable time. This implied covenant is, after oil or gas has been discovered, as effectual and forceful as if it were expressed in direct terms. Implication is but another term for intention. And the practically universal interpretation of oil and gas leases is that in the absence of an express covenant there arises a legal implication that the lessee will drill as many wells as will afford sufficient protection against drainage and otherwise so develop the leased premises as to serve the mutual benefit of both lessor and lessee. *Jennings vs. South Carbon Co.*, 73 W. Va. 215, 80 S. E. 368; *Chandler vs. French*, 73 W. Va. 658, 81 S. E. 825; see, also, *Daughette vs. Ohio Oil Co.*, 263 Ill. 518, 105 N. E. 308. The doctrine of implied covenants in mineral leases has been limited generally to cases in which it has been invoked to supply a consideration when none has been expressed and to make effective a principle of surrender by operation of law when the premises have been abandoned after discovery of mineral and delay rentals have ceased, and to prevent loss of the subject matter of the lease through wells on adjacent lands. *Carper vs. United Co.*, 78 W. Va., 433, 89 S. E. 14.

covenant will be construed to be several by reason of several interests if it be expressly joint. This rule was applied to an oil and gas lease executed by a husband and wife as "parties of the first part" where the rentals were to be paid to the "party of the first part." Under this ruling a payment of rentals to the wife was a discharge of the obligation, although the title to the land was in the husband.¹⁴

§ 11. No Covenant Implied.

No covenant to develop the land can be implied under an oil and gas lease in the face of an expressed stipulation for periodical payments for delay thereof not extending beyond a definite term. Development on other lands in the vicinity may show the premises to be situated in an oil and gas territory and prove the adaptability of the land for profitable mining operations, but the lessor has no legal cause for complaining so long as he receives compensation for the delay for which he contracted and the operations on neighboring lands do not drain the leased premises. Under such circumstances a court will not imply a covenant for diligent operation or operation at all. The lessor is deemed to have assented to the postponement through the several periods and bound to accept the periodical payments therefor.¹⁵

§ 12. Breach of Implied Covenant.

Equity rarely will arbitrarily declare the forfeiture for the breach of an implied covenant. It never will do so where less drastic redress will satisfy the demands of justice.¹⁶ Where the lessee fails to begin operations within a reasonable time he will be presumed to have aband-

¹⁴ *Jens Marie Oil Co. vs. Rixse*, 72 Okla. —, 178 Pac. 658; see, also, *Jenkins vs. Williams*, 191 Ky. 165, 229 S. W. 98.

¹⁵ *Eastern Oil Co. vs. Beatty*, *supra* (6). An implied covenant may exist to reasonably operate the premises, but there is no implied or express covenant on the part of the lessee to leave the premises and forfeit his lease for a breach of such implied covenant. A lease provided for a forfeiture for the failure to comply with its conditions or to pay the cash consideration according to the agreement, but a breach of the implied covenant to reasonably operate the premises was not included in the causes of forfeiture. Where some causes of forfeiture are expressly mentioned none others can be implied. The remedy for a breach of the implied covenant to reasonably operate the premises is, therefore, not by way of forfeiture of the lease, but must be brought in a proper action for a breach of covenant. *Grubb vs. McAfee*, *supra* (6); see *Harris vs. Ohio Oil Co.*, 57 Ohio St. 131, 48 N. E. 502; *Poe vs. Ulrey*, 233 Ill. 56, 84 N. E. 46.

¹⁶ *Alford vs. Dennis*, 102 Kan. 403, 170 Pac. 1005; see *Rembarger vs. Losch*, 70 Ind. 98, 118 S. W. 331; *Hughes vs. Busseyville Co.*, *supra* (6). It is error for a court to instruct a jury in an action to cancel or forfeit an oil and gas lease to the effect that the law looks with disfavor upon and discourages the forfeiture of rights of parties and declares that before a forfeiture will be decreed the evidence on which the forfeiture is predicated must preponderate in favor of the forfeiture. The general rule of law does not apply where the grant is in the hope and expectation of pecuniary profit from mineral development. In such cases the rule that equity abhors forfeitures does not apply for the reason that forfeitures when the lessee is guilty of laches is in that respect but equity. *Munsey vs. Marnet Co.*, — Tex. C. A. —, 199 S. W. 686.

oned his rights, and a court of equity will, at the suit of the lessor, cancel the lease as constituting a cloud upon the title.¹⁷

§ 13. Diligence.

The question of reasonable diligence is one of fact.¹⁸ Whether or not due diligence has been exercised depends on the facts and circum-

¹⁷ *Horse Creek Co. vs. Trees*, 75 W. Va. 401, 84 S. E. 376; see *United Co. vs. Smith*, — W. Va. —, 117 S. E. 902. The lessor in an oil and gas lease for a stated term and conditions and requiring the lessee to drill a well within a specified time and to pay certain stipulated royalties, may sue the lessee for a breach of any express or implied covenant of the lease resulting in damages to him. A cause of action immediately arises in his favor. He is not required to wait until the abandonment of the premises or expiration of the lease to bring his action. The remedy in such case is not the forfeiture but a right to sue for a breach of the contract. In an action against the lessee of an oil and gas lease for damages for breach of a covenant, in that the lessee failed to diligently develop the premises after the discovery of oil in paying quantities, the lessor is not prevented from recovery because the damages are speculative or conjectural. The rule is that while the law will not permit witnesses to speculate or conjecture as to the possible or probable damages, still the best evidence of which the subject will permit is receivable. This is often nothing better than the opinion of well-informed persons on the subject matter under investigation. The lessee in such an action is not liable for damages though he has committed no fraud and has acted in good faith and has not drained oil from the lessor's premises by means of wells on other adjacent lands. Nor, is he permitted to escape for a failure to drill and operate additional wells if, acting on his own judgment, he believes that it will not be profitable for him to do so, as his determination in such case is not final. Such a lease can not be construed to save the lessee harmless on his arbitrary refusal to further explore and develop the leased premises. In such case the lessor is not required to prove that oil and gas have actually been lost to him by being drawn from the leased premises through wells on adjacent premises or by some wrongful or fraudulent act of the lessee. Under such a lease it clearly is the contemplation of the parties and the primary object in making the lease that the lessee shall go on and drill additional wells, market the product, and pay the lessor his royalties thereon. The lessee, in effect, agrees to do this in order that the lessor can realize on the value of the product. *Daughetee vs. Ohio Co.*, *supra* (43); *Indiana Co. vs. McCrory*, 42 Okla. 136, 140 Pac. 610; *Hammett vs. Gypsy Oil Co.*, — Okla. —, 218 Pac. 501.

¹⁸ *Buffalo Valley Co. vs. Jones*, 75 Kan. 18, 88 Pac. 537; *Chapman vs. Sunshine Oil Co.*, — Tex. C. A. —, 256 S. W. 327. As a net result of consideration of the cases which hold that, in the absence of express and definite stipulation as to the measure of diligence, an implied covenant exists demanding reasonable diligence in the development of the premises leased, it may be fairly said, in determining whether or not other wells should have been drilled, consideration must be given to a number of facts regarded collectively. Some of these are: the result of oil operations on adjacent premises; the extent of the subterranean oil reservoir; also its character and contour as affecting the question of drainage to and from the property in question; market conditions; the quantity and quality of oil thus far produced; the prospects for further production as indicated and the knowledge possessed by those expert in locating oil bodies; the demands made upon the lessee in the maintenance of the wells already drilled and his diligence in operating them to secure the greatest possible production. Leases are intended for the benefit of both parties. The lessee has a right to regard his own interest as well as that of the lessor. In short, the diligence required of the lessee involves such a course of conduct upon his part as operators of ordinary diligence would pursue, having in mind the securing of the financial benefits sought by both lessor and lessee. *Becker vs. Submarine Oil Co.*, *supra* (4). A lease of certain lands granted "all the oil and gas" under the lands described together with the right to enter at all times for the purpose of drilling and operating, together with the right to erect and maintain structures, pipe lines, and machinery necessary for the production and transportation of oil and gas and gave the right to use sufficient water, oil, and gas to run the necessary engines in the prosecution of the business. The lease reserved to the lessor substantial royalties in kind and in money on the oil produced and saved and on the gas used off the premises. The lease indicating that the promise of such royalties was the controlling inducement to the grant. While expressly requiring that such drilling commence within a stated time from the date of the lease, but not expressly defining the measure of diligence to be exercised by the lessee in the work of development and production after the expiration of the stated period, the lease was held to contain a covenant on the part of the lessee arising by necessary implication from the nature of the lease and the stipulations therein contained to the effect that if during the term of the lease whether oil or gas is found in paying quantities then the work of development and production shall be continued with reasonable diligence and along lines as will reasonably be calculated to make the extraction of oil and gas from the leased land of mutual advantage and profit to the lessor and lessee. *Indiana Co. vs. McCrory*, *supra* (47). Though a lessee not guilty of fraud or bad faith may be liable for failure to exercise reasonable diligence in drilling protection wells, and where the lease has no express requirements, no breach of an implied covenant can occur, except when the absence of such diligence is both certain and substantial in view of the actual circumstances as distinguished from mere expectancy on the part of the lessor and conjectures on the part of mining enthusiasts. The expense of exploration and development, and the fact that the lessee must bear the loss of unsuccessful operations, entitles him to proceed with due regard for his own interests as well as those of the lessor. *Goodwin vs. Standard Oil Co.*, 290 Fed. 92.

stances of the case. If an oil and gas lease is not operated with due diligence under the facts and circumstances of the case, then a court upon proper showing may declare the lease forfeited.¹⁹ Where the only consideration the lessor receives for the exclusive right to explore, develop and remove the minerals is a royalty, whether it be oil or gas or other minerals, the courts have read into the lease the implied covenant to develop and operate with reasonable diligence.²⁰ It is an implied covenant in an oil and gas lease providing for the payment of royalties that the lessee will use reasonable diligence and good faith in exploring and developing the property.²¹ The question of due diligence may be affected by the fact that the lessee worked in a "wild cat" field.²² In *Wapa Co. vs. McBride*,²³ the court, in stating his reason for cancelling the lease, stated it was for failure to comply with the implied covenant which was to protect the premises from drainage of off-set wells. A court of equity will declare a forfeiture of an oil and gas lease because of the breach of an implied covenant to diligently operate and develop the property when such forfeiture will effectuate justice, but the granting of such relief depends upon the facts and circumstances surrounding the particular case; and if the evidence shows that a part of the leased premises under an oil and gas lease has been properly developed with reasonable diligence by the lessee, and other parts have not, the court may cancel the lease as to the undeveloped portion and permit the lessee to continue the developed part.²⁴ Where a mining lease provided for an annual payment as an advance payment, to continue "until mining is commenced or during the continuance of this agreement," the court said: "That the exploration for minerals should be made within a reasonable time is of the very essence of the agreement; and a condition precedent to the accruing of the right to take the minerals discovered upon the terms of payment indicated. The failure to make such exploration within a reasonable time, and to make it with such thoroughness and certainty as to determine the existence of mineral or oil, would be fatal to the agreement. Upon this, we think, this lease depended as a condition precedent."²⁵ Where an oil and gas lease covering lands located in a field which is being actively developed is given for a term of two years and contains a provision that, in case oil or gas is found on the premises, the lease may be continued in force by lessee so long as he diligently develops the land and markets the product, the failure of the lessee to use reasonable diligence in the respects named will cause said lease to lapse.²⁶ Where the lessee undertakes to pay the lessor until, in the judgment of the lessee, "oil or gas can not be found on the premises, or, having been found, has ceased to exist," clearly implies an engagement to explore and develop the premises.²⁷ The extent of the development and number of wells to be drilled, and as to the protection of the lines is often, if not usually, expressed in the lease; and that is certainly the better practice. When the extent of

¹⁹ *Strange vs. Hicks*, 78 Okla. 1, 188 Pac. 350.

²⁰ *Cotner vs. Munday*, — Okla. —, 219 Pac. 321.

²¹ *Peoples Gas Co. vs. Dean*, 193 Fed. 938.

²² *Keechi Co. vs. Smith*, 81 Okla. 266, 198 Pac. 588.

²³ 84 Okla. 184, 201 Pac. 984.

²⁴ *Papoose Oil Co. vs. Rainey*, 89 Okla. 110, 213 Pac. 882.

²⁵ *Tenn. Oil Co. vs. Brown*, 131 Fed. 700.

²⁶ *Buffalo Valley vs. Jones*, *supra*.⁽¹⁸⁾

²⁷ *Consumers Co. vs. Littler*, 162 Ind. 320, 70 N. E. 363.

the development and protection of the lines is provided for in the lease, there can be no implied covenant for further development and protection of the lines. The implied covenant arises only when the lease is silent on the subject.²⁸ The smaller the tract of land demised, the more important is the need of prompt exploration and development, because the lessor is entitled to his royalty as promptly as it can be had, and delay endangers the drainage of oil and gas from the demised premises through wells in its immediate vicinity.²⁹

§ 14. Surface Rights.

Ordinarily, by implication, the lease carries with it the right to use so much of the surface as is necessary for extracting and removing the minerals thereunder.³⁰

§ 15. Location of Wells.

An oil and gas lease provided that no wells be drilled within two hundred feet of the buildings on the leased premises without the consent of the lessor. During the development of the land by the lessee and over the objections of the lessor the lessee located and drilled a well within the prohibited distance with full knowledge that the well was so located. The lessor was entitled to an injunction perpetually restraining the lessee from operating the well so drilled and from entering upon or in any manner using any ground within two hundred feet of the buildings upon the demised premises.³¹

²⁸ *Harris vs. Ohio Oil Co.*, *supra*.^(a); see *Brewster vs. Lanyon Zinc Co.*, 140 Fed. 801.

²⁹ *Federal Oil Co. vs. Western Oil Co.*, 112 Fed. 375.

³⁰ The lessor and the lessee under an oil and gas lease are both in possession of the surface. Each, in the exercise of his right therein and thereon is in duty bound to have due regard for the rights of the other. The lessee in exercising his rights under such a lease owes the duty to the lessor to not unnecessarily, carelessly, or wantonly injure him in the proper use of the surface. In choosing between two locations for drilling a well equally available to him, the lessee is bound to choose the one to do least injury to the lessor. He is not at liberty to choose locations for the drilling of wells in utter disregard of the rights of the lessor. Likewise the lessor in the use of the surface for any available purposes is in duty bound to exercise reasonable care not to interfere with, injure, or annoy the lessee in drilling and operating his oil wells. Under such circumstances each is bound to use his own so as not to injure the rights of the other. *Gillespie vs. American Zinc Co.*, 247 Pa. St. 222, 93 Atl. 272; see *Moore vs. Decker*, — Tex. C. A. —, 220 S. W. 773. Injunction lies to prevent the surface owner of land from obstructing the mineral owner in the right to use surface. *Squires vs. Lafferty*, — W. Va. —, 121 S. E. 90. In the absence of a specific covenant in an oil and gas lease making the lessee liable for damages to growing crops and their surface rights, the lessee is not liable for such damages as are necessarily incident to the operations authorized by the lease. Such a lease carries within its implications, if not within its expression, such rights to the surface as may be necessarily incident to the performance of the objects of the contract. Yet these implications go no further. The lessee must protect the surface of the ground in so far as such incident necessity does not exist and is liable to the lessor for any damages to the surface resulting from acts not within the implications of the lease. *Pulaski Oil Co. vs. Connor*, 62 Okla. 211, 162 Pac. 466. A lessee having the right under his lease to go upon certain described land of the lessor and bore and develop said land for oil and gas, with the necessary usual and convenient rights therefor, has a right to build a road over the land where the building of such road is necessary to enable him to haul material for his rig and tools and machinery for drilling. If, after building such road in good faith, he abandons the contemplated exploration for oil and gas before drilling a well, he is liable to the lessor for damages to the land caused by the building of said road. *Coffindaffer vs. Hope Co.*, 74 W. Va. 107, 81 S. E. 966. The right of the owner of surface of land to subjacent support includes the right to use the soil for the agricultural pursuits to which it may be adapted. *Cole vs. Signal Knob Co.*, — W. Va. —, 122 S. E. 268; see *Walsh vs. Kansas Fuel Co.*, 91 Kan. 310, 137 Pac. 941.

³¹ *Kelly vs. Phillips Co.*, 262 Pa. St. 412, 105 Atl. 631. A stipulation in an oil and gas lease to the effect that no wells should be drilled within three hundred feet of a dwelling house unless with the consent of both parties, indicates that the parties in making the lease did not intend to burden the property. This intention will prevail as against an effort to make the provision a covenant running with the land. *McFarland vs. Gulf Co.*, — Tex. C. A. —, 204 S. W. 460.

§ 16. Additional Wells.

The number and location of oil wells requisite to the performance of the covenant to develop on the part of the lessee depends upon the character of the leased lands. The area of the lands does not determine the number and their relation to one another and is not governed by any fixed rule. Whether, after discovery of oil or gas by means of the initial or experimental well, there is a duty to sink additional wells depends upon the probability arising from the circumstances surrounding the property, that an additional well be profitable to the lessee. The lessee in an oil lease is under no duty to operate at a loss to himself in order to make the premises profitable to the lessor. It is only under circumstances indicative of mutual profit to the lessee as well as to the lessor that the duty to develop devolves.³²

§ 17. Drainage of Adjoining Lands.

While oil wells drilled and operated may, by reason of their proximity to a division line, in fact drain oil from adjoining lands, yet such operations, in the absence of special circumstances or relations between the parties, offer no basis for a claim to a share in or accounting for the oil so produced, or for a receivership for the operation of the wells.³³

§ 18. Off-set Wells.

The courts are not harmonious as to whether or not in an ordinary lease of oil and gas lands there is no implied covenant by the lessee to

³² *Steele vs. American Co.*, 80 W. Va. 206, 92 S. E. 410; and see *Burt vs. Deorsam*, — Tex. Co. C. A. —, 227 S. W. 354; *Humble Oil Co. vs. Strauss*, — Tex. C. A. —, 243 S. W. 536; *Clark vs. Cooper*, — Tex. C. A. —, 247 S. W. 929. For a clear and full discussion of the principle of law, see *Brewster vs. Lanyon Zinc Co.*, *supra* ⁽²⁸⁾. The number and location of wells requisite to the performance of a covenant to drill under an oil and gas lease depend upon the character of the leased territory and whether after the discovery of oil or gas there is a duty to sink an additional well or wells depends upon the probabilities arising from the circumstances surrounding the property and whether they will be profitable to the lessee. The lessee is under no duty to operate a lease at a loss to himself to make the premises profitable to the lessor. The lessee must bear all the burdens incident to development and if a well is dry he loses its cost; but if it proves rich in either mineral the lessor receives his share but loses nothing in any event. For such reasons the lessee, except where he fraudulently fails or refuses to act when affirmative action is required, must control the prosecution of the necessary operations, but he can not unduly delay operations where clearly the conditions surrounding the property are such as require speedy progress to effect development and to afford protection against drainage. *Jennings vs. South Carbon Co.*, *supra* ⁽³¹⁾.

³³ *Gain vs. South Penn. Co.*, 76 W. Va. 769, 86 S. E. 883; see *Fairbanks vs. Warrum*, 56 Ind. A. 337, 104 N. E. 1114. The courts of Texas recognize that a cause of action may be alleged and proved against a lessee for failure to act so as to save from waste the leased premises caused by outside wells under express, as well as by implied agreement. *Burt vs. Deorsam*, *supra* ⁽³²⁾; *Humble Oil Co. vs. Strauss*, *supra* ⁽³²⁾; *Texas Co. vs. Barker*, — Tex. C. A. —, 252 S. W. 809. As to measure of damages see *Texas Co. vs. Barker*, *supra*. A lessee who obtained an oil and gas lease from the owner of land and who was unable to obtain a lease from the adjoining landowner, is not to be charged with fraud by the latter and is not liable to such adjoining landowner for any part of the oil produced by him from wells on the leased land, though located so near the line as to drain the oil from the adjoining premises. The mere execution of such a lease causes no inference of a fraudulent intent and justifies no implication on the part of the lessee to wrong the adjoining landowner. *Gain vs. South Penn. Co.*, *supra*. Drainage can be prevented only by drilling off-set wells. *Eastern Oil Co. vs. Beatty*, *supra* ⁽³⁰⁾. The authorities are generally agreed upon the rule that because of the peculiar nature of the subject matter of the contract and the probability of great loss likely to result to the lessor from the failure by the lessee to prosecute drilling operations promptly, by reason of drainage from the leased property into surrounding wells already in operation, such leases are most strictly construed against the lessee and in favor of the lessor. *Taylor vs. Hamilton*, *supra* ⁽³²⁾.

protect the leased premises against drainage through flowing wells on adjacent land by drilling off-set wells. There is an implied condition that he will do so upon the demand of the lessor.³⁴

§ 19. Failure to Drill Off-set Wells.

In order that a lessor may recover damages from a lessee in an oil and gas lease because of the failure to drill off-set wells to prevent the drainage of the oil in the leased lands by wells drilled on adjacent lands, it must appear from the evidence that it is reasonably certain that the oil from the lessor's land has been or is being drained by the wells drilled on adjacent land. It is not possible to prove this with absolute certainty. It is not impossible, nor is it difficult, to prove such circumstances as would reasonably lead to the conclusion that such was the fact. Thus, it would be easy to show the character of the sand in which the oil was found on the adjoining land. That wells had been drilled on such lands; their distance from the land, and the oil produced therefrom. It could also be shown what area would probably be drained of oil by the wells drilled in the particular sand in which the wells were drilled on the adjoining land. If such area, so probably drained, included a part of the leased lands, it could then be reasonably assumed that the wells on the adjoining lands were draining oil from the leased lands.³⁵

§ 20. Rentals.

The development of the leased premises is a controlling consideration with oil and gas leases and lessees may be held liable in damages, or the lease forfeited and cancelled according to its provisions for failure to develop in accordance with the fair and reasonable interpretation of the lease. But this does not prevent the contracting parties from stipu-

³⁴ Stanley vs. United Co., 78 W. Va. 793, 90 S. E. 344. But see United Co. vs. Meredith, — Tex. C. A. —, 258 S. W. 550; Chambers vs. Perrine, 81 W. Va. 321, 94 S. E. 381; compare Jennings vs. Southern Carbon Co., *supra* (43); Chandler vs. French, *supra* (42). The rule that should govern in determining whether off-set wells should be drilled, and the intent, etc., is that which in the circumstances would be reasonably expected of operators of ordinary prudence and it is not necessary to prove that the lessee acted fraudulently. Burt vs. Deorsam, *supra* (42); Texas Co. vs. Ramsower, — Tex. C. A. —, 255 S. W. 466. In a lease of land for the production of oil and gas in which the lessee obligated himself to begin the drilling of a well within a specified time or forfeit the lease, there is no implied covenant on his part to drill as many wells as may reasonably be necessary to secure the oil or gas for the common advantage of the lessor and the lessee within such time, where oil or gas has not been found in paying quantities. Nabors vs. Producers Co., 140 La. 985, 74 S. E. 527; but see Carper vs. United Co., *supra* (43). The practically universal interpretation of oil and gas leases is, that where the contract does not expressly state what shall be done by the lessee, there lies the legal implication that if he finds oil and gas, or if they are found on adjoining lands, he will drill as many wells as will offer sufficient protection against drainage, and so otherwise develop the leased lands as to serve the mutual benefit of lessor and lessee. The necessity for such interpretation is based on the illusive and migratory nature of oil and gas, their disposition to travel and to find vent through the most readily accessible opening. The lessee though experienced, as against the lessor, who is without experience, can not fraudulently exercise his judgment solely to promote his individual interest, ignoring the interest of the lessor, but to serve him, his judgment must conform to that generally exercised by other operators in similar circumstances and conditions and in view of the intention of the parties entering into the lease. Steele vs. American Oil Co., *supra* (32); see, also, Doddridge Co. vs. Smith, 154 Fed. 970; Harris vs. Ohio Oil Co., *supra* (45); Highfield Co. vs. Kirk, *supra* (6); Guffey Co. vs. Jeff Chaison Co., 48 Tex. C. A. 555, 107 S. W. 609; Texas Co. vs. Ramsower, *supra*.

³⁵ Steele vs. American Oil Co., *supra* (32).

lating for the payment of a fixed sum as a minimum rental in lieu of development.³⁶

§ 21. By-products.

The fact that the lessee of an oil and gas lease, who had drilled and was operating oil wells, installed and connected vacuum pumps in connection with such wells for the purpose of increasing the production thereof, and the further fact that the lessee successfully utilized what was called "vapor," which was emitted from the wells at the casing head, and by process of distillation and compression converted the escaping substance into gasoline for the mutual advantage and benefit of the lessor and lessee, did not thereby render the lessee liable for the annual rental of gas wells, under the terms of the lease. The mere collecting of the vapor or volatile substance and the manufacture of gasoline therefrom was no indication of proof of gas in the wells, and did not bring them within the terms of the lease as producing gas wells.³⁷

§ 22. Delay Rentals.

A covenant in an oil and gas lease for quarterly delay rentals, performed in part only, is separate, distinct, and disassociated from a covenant to drill or pay rentals. Performance or part performance of the former covenant does not excuse the nonperformance of the latter.³⁸ A covenant in an oil and gas lease requiring the lessee to complete a well within a specified time from the date of the lease or pay the lessor a stated sum each month for each additional month such completion was delayed until a well was completed, is for the benefit of the lessor only. In case of violation of the covenant on the part of the lessee the lessor may either cancel or terminate the lease, or he may, at his option, col-

³⁶ *Gilbert vs. Bolds*, 62 Ind. A. 595, 113 N. E. 379; see *Carper vs. United Co.*, *supra* (13). A provision in an oil and gas lease rendering it null and void for failure to pay the rent as stipulated is for the protection of the lessor. In order to terminate the lease by reason thereof it requires affirmative action on his part. Notwithstanding the failure to pay the rent the tenancy continues until the lessor declares a forfeiture. If before the lessor takes action the rent due is paid or tendered it heals the breach and saves the tenancy. *McKean Co. vs. Walcott*, *supra* (2). In an oil and gas lease where development is contemplated and an annual rent is provided for, if in case wells are not drilled within a stated time the payment of rent is not of the essence of the contract. Payment at any reasonable time or upon reasonable demand would be sufficient to avoid forfeiture. *Bloom vs. Rugh*, 98 Kan. 589; 160 Pac. 1135. A clause in an oil and gas lease to the effect that the failure of the lessee to complete a well upon the premises described within the time specified or to pay the rentals at the time and manner as therein provided shall *ipso facto* work a forfeiture of the lease without notices applies only to rentals provided to be paid for delay in drilling and not to rentals or royalties to be paid for gas from a producing well. *Castlebrook Co. vs. Ferrell*, 76 W. Va. 300, 85 S. E. 544. A lessee of an oil and gas lease may be required to pay rent as long as he holds possession, although the lease by its terms may be at an end; but the execution of an oil and gas lease creates no presumption of subsequent possession by the lessee. *Ash Grove Co. vs. Chanute Co.*, 100 Kan. 547, 164 Pac. 1087. Where the lands of which the husband died seized were subject to a valid oil and gas lease at the time of his death, yielding a rental, the widow is dowerable of the reversion and the rent or royalty as an incident of the reversion. *Campbell vs. Lynch*, 81 W. Va. 374, 106 S. E. 869.

³⁷ *Locke vs. Russell*, 75 W. Va. 602, 84 S. E. 948; see *Wemple vs. Producers Oil Co.*, 145 La. 1031, 83 So. 232.

³⁸ *Hefner vs. Light Co.*, *supra* (9).

lect the rents stipulated in the lease until the premises are reconveyed or until the term of the lease expires.³⁹

§ 23. Forfeiture Avoided.

An oil and gas lease provided that if the lessee did not drill a well within one year a stipulated rental was to be paid for each additional year the beginning of operations was delayed. Where no operations were commenced during the second year the stipulated rental was not due until the end of that year. The tender of the rental for the second year before the end of that year was sufficient to avoid forfeiture.⁴⁰

§ 24. When Development Not Compulsory.

Where an oil and gas lease is for a definite term and provides for the payment of a stipulated sum for delay during that time and that provision still is effective, the lessor can not refuse the stipulated payments for delay and recover damages, or invoke a forfeiture for a failure to develop on demand. This, in fact, would permit one party to the contract to demand and enforce immediate performance of that which he had agreed might be deferred. A lessor suffers no injury in consequence of his inability to compel development under such circumstances except delay in realizing royalties upon oil and gas that might be produced. The oil and gas still are available for later operation and to the delay in producing that he has solemnly consented for the compensation payable as stipulated.⁴¹

³⁹ McKee vs. Grimm, 57 Okla. 680, 157 Pac. 308; Brunson vs. Carter Oil Co., *supra* ⁽⁴¹⁾. Where an oil and gas lease was executed before any discoveries of oil or gas had been made on the leased premises and before there had been any discoveries or developments on adjacent lands, and the lease provided for payment of rentals as to certain stated periods in lieu of development, and where after execution of the lease wells are drilled on adjacent lands that make the drainage of oil and gas under the leased premises probable and the consequent loss to the lessor imminent, the law will then imply a condition for the development of the leased premises by the lessee, on demand and notice from the lessor that he will refuse to receive further rentals. This on the theory that where an implied condition will adequately protect from the results of a contingency which it is evident the parties did not intend to disregard but for which they made no express provision, and will be less onerous to one of them than a covenant for such purpose would be. The principle of equity covering any construction and the limitation of necessity upon addition by implication, make it the duty of a court to adopt the condition, not the covenant, as an unexpressed provision of the contract. Carper vs. United Co., *supra* ⁽⁴⁰⁾. An oil and gas lease provided that on certain conditions it should become null and void unless the payee paid quarterly in advance a specified sum as compensation in lieu of drilling within the succeeding quarter. Such a lease or agreement does not create a mere tendency at will, terminable at the option of the lessor or void as a perpetuity. But the lessor may require development after the end of any quarter for which the lessee has paid the agreed compensation for delay upon reasonable notice to the lessee. In the event of the lessee's failure to drill within reasonable time after such notice, equity will cancel the lease upon application by the lessor. Johnson vs. Armstrong, 81 W. Va. 399, 94 S. E. 753; see Todd vs. Manufacturers Co., 90 W. Va. 40, 110 S. E. 446; see, also, Smith vs. McCullough, 285 Fed. 698.

⁴⁰ Hughes vs. Parsons, *supra* ⁽⁵⁾; see Dix River Co. vs. Pence — Ky. —, 123 S. W. 263; Warren Co. vs. Gilliam, *supra* ⁽⁵⁾; McNutt vs. Whitney, 192 Ky. 132, 232 S. W. 386; Union Co. vs. Indiana Tex. Co., — Ky. —, 251 S. W. 1008. Where an oil and gas lease provides for a forfeiture unless a well is drilled through a certain sand within a specified time, the lessee is not required to drill below such sand in search of a new sand, but his contract has been complied with when he has drilled through the specified sand. Papoose Co. vs. Swindler, — Okla. —, 220 Pac. 506.

⁴¹ Eastern Oil Co. vs. Beatty, *supra* ⁽⁹⁾.

§ 25. Lessor's Option.

An oil and gas lease required the lessee to begin drilling within a stated time or pay a certain stated sum per month for failure to commence drilling. The lease also provided that a failure upon the part of the lessee to comply with the conditions thereof would render it void. These provisions give the lessor the option as to his remedy. He may elect to put an end of the lease, or he may elect to have the lease continued in force to the end of the term and enforce the payment of the amount due each month.⁴²

§ 26. Consideration.

Oil and gas leases are not dependent for their validity on an agreement to pay royalties and a consequent expressed or implied covenant to develop. There may be any other consideration agreeable to the parties and valuable in law, or the consideration may be wholly executory. It may be in money only, paid at the time of the execution and delivery of the instrument. The amount recited may be small, only one dollar, but a dollar is a unit of value and is a thing of value. In fact and in the eyes of the law one dollar is a sufficient consideration to support a conveyance of land. If sufficient to support the conveyance of the whole estate in land it is sufficient to support a grant of a less interest. Where one dollar was the sole consideration paid for an oil and gas lease and the payment was recited in the instrument, the instrument would not be void. But, aside from this, it may be that development and prospective royalties are the real and moving consideration for such a lease. But this can not be where the parties expressly agree that development may be deferred for a stated time. One of the considerations, and, perhaps, the principal one for such a

⁴² Allen vs. Narver, 178 Cal. 102, 172 Pac. 980. An option supported by a consideration, furnishes an illustration of a contract which is valid notwithstanding the lack of mutuality. It is no objection to the validity of a contract that the holder of the option is under no obligation to exercise it. Pierce Ass'n vs. Woodrum, — Tex. C. A. —, 188 S. W. 245. Unless based upon a sufficient consideration, an option merely is a continuous offer of sale which may be withdrawn at any time before acceptance. Worlds Fair vs. Powers, 224 U. S. 173; Milwaukee Co. vs. Shea, 123 Fed. 9; Brown vs. Savings Union, 134 Cal. 448, 55 Pac. 598; Hobbs vs. Davis, 168 Cal. 556, 143 Pac. 733; see Baker vs. Mulrooney, 265 Fed. 529. A consideration of one dollar, in the absence of fraud or bad faith, is sufficient. Pittsburg Co. vs. Bailey, 76 Kan. 42, 90 Pac. 803. An agreement to drill a well on the property covered by the option is sufficient. Starr vs. Crenshaw, 279 Mo. 344, 213 S. W. 811. After acceptance of the terms by the holder of the option, the parties are mutually bound and either one may compel specific performance by the other. Hoogendorn vs. Daniel, 178 Fed. 765; Heyward vs. Bradley, 179 Fed. 325. That an accounting may be had, see S. P. Mines vs. Court, 33 Nev. 97, 110 Pac. 503. Time is of the essence of the option whether so expressly stated therein or not. Waterman vs. Banks, 144 U. S. 394; Mackey vs. U. S., 144 U. S. 394; Mackey vs. U. S., 244 Fed. 275; Champion Co. vs. Champion Mines, 164 Cal. 205, 128 Pac. 315; Merk vs. Bowery, 31 Mont. 298, 78 Pac. 519. The condition as to time may be waived or relieved against in equity. Wheeling Co. vs. Elder, 54 W. Va. 255, 46 S. W. 357. A further consideration is not necessarily incidental to the mere extension of time for performance of the conditions of the option. See L. R. A. 1915B. That a verbal promise to extend the time is sufficient, see Stamey vs. Hemple, 173 Fed. 61; Downey vs. Gooch, *supra* ⁽⁶⁰⁾. One who is in possession under an agreement to convey giving him the right of possession, may maintain an action against a stranger to the title for a trespass which consists of the removal and conversion of the substance of the estate. He may even recover from his vendor for injuries amounting to waste, committed upon the premises after delivery of possession. Lightner vs. Lane, 161 Cal. 689, 120 Pac. 771. If it is provided in the option agreement that in case of default in making any of the payments the property shall revert back to the grantor of the option, it is not necessary to return the payments made nor wait until final payment was due and in default before bringing suit in ejectment. Williams vs. Long, 139 Cal. 186, 62 Pac. 264; see, also, Hazzard vs. Johnson, 45 Cal. A 191, 187 Pac. 121. For repossession of property and fixtures, see Smith vs. Beebe, 31 Ida. 496, 174 Pac. 608; see, generally, Worlds Fair vs. Powers, *supra*; Skookum Co. vs. Thomas, 162 Cal. 539, 123 Pac. 363; Champion Co. vs. Champion Mines, *supra*.

grant, is the covenant to develop and yield prospective royalties, or pay the stipulated price in lieu thereof.⁴³

§ 27. Insufficient Consideration.

The rule that contracts performed without sufficient consideration which are optional as to one of the parties are optional as to both, applies to contracts or oil and gas leases consisting of mutual promises wholly executory and unperformed. The promises on one side being the sole consideration for the promise on the other and in which it is optional with one of the parties whether he will perform his promise, then prior to performance by him, it is optional with the other whether he will perform his promise. The correct statement of the rule is that contracts unperformed, without sufficient consideration, which are optional as to one are optional as to both.⁴⁴

§ 28. Ambiguous Lease.

The object of the interpretation and construction of an oil and gas lease is to arrive at and give effect to the mutual intent of the parties as expressed in the lease. Where a lease is ambiguous, the true intention, if it can be ascertained from the contract, must prevail over verbal inaccuracies, inapt expressions, and dry words of the stipulations. It is the duty of a court to place itself as far as possible in the position of the parties at the time the lease was executed and to consider the instrument itself as drawn, its purpose and the circumstances surrounding the transaction; and, from a consideration of all these elements, to determine upon what sense and meaning of the terms used their minds actually met.⁴⁵

§ 29. Joint Lease.

A joint lease, by which separate owners lease their lands described as a single tract, gives the lessee the right to explore for oil upon any or all of such tracts of land. By the production of oil upon any one of such tracts there is vested in the lessee the right to extract and remove the oil from all the tracts whether by means of a well, or wells, drilled upon one of them, or more than one of them. After the oil is produced the royalties, or the royalty oil, should be delivered to the lessors and divided among them in the proportion that the parcel of land held by each of them bears to the total area of the land.⁴⁶

⁴³ Rich vs. Doneghy, *supra* (6); McKay vs. Lucas, — Tex. C. A. —, 220 S. W. 172; McKay vs. Kilcrease, — Tex. C. A. —, 220 S. W. 177; Davis vs. Texas Co., — Tex. C. A. —, 232 S. W. 556; but see Nolan vs. Young, — Tex. C. A. —, 220 S. W. 154; see Guffey vs. Smith, *supra* (11); Eastern Oil Co. vs. Beatty, *supra* (6); Norton vs. Young, — Tex. C. A. —, 220 S. W. 158; see Hunter vs. O'Rear, — Ky —, 259 S. W. 41.

⁴⁴ Rich vs. Doneghy, *supra* (6); see Hill Oil Co. vs. White, *supra* (10).

⁴⁵ Witherington vs. Gypsy Oil Co., 68 Okla. 138, 172 Pac. 634; Prowant vs. Sealy, 77 Okla. 244, 187 Pac. 239. In the construction of an ambiguous oil and gas lease a court, in order to ascertain the intention of the parties will consider the interpretation placed upon the lease by the parties themselves and will also look to their actions thereunder before any controversy arose between them as to its meaning. And such construction, when reasonable, will be adopted and enforced by a court and the construction placed thereon by the parties will prevail if the language will reasonably allow of such construction, although the court would probably adopt a different one but for the particular construction already placed by the parties on their agreement. Bearman vs. Dux Co., *supra* (6).

⁴⁶ Lynch vs. Davis, 79 W. Va. 437, 92 S. E. 427; see Higgins vs. California Co., 109 Cal. 304, 41 Pac. 1087; Wettengel vs. Gormley, 160 Pa. 559, 28 Atl. 934; Gillette vs. Mitchell, — Tex. C. A. —, 214 S. W. 619; but see Northwestern Co. vs. Ullery, 68 Ohio St. 259, 67 N. W. 494; compare Pittsburgh Co. vs. Ankrom, 83 W. Va. 31, 97 S. E. 593; see, generally, Fairbanks vs. Warrum, *supra* (39); Pierce Corp. vs. Schacht, 75 Okla. 101, 181 Pac. 731.

§ 30. Sublease.

A lessee of certain oil and gas lands sublet a portion of the leased premises to a third person. The original lease contained a covenant against incumbrances. The lessor brought suit to recover the rents collected from a subtenant and to forfeit the original lease on the ground that the subletting was for a purpose not contemplated by the provisions of the lease and was an incumbrance in violation of the covenants of the lease. The lessor made no claim for damages nor was any proof offered of any damages by reason of the subletting and of the alleged improper use of the premises by the sublessee. The Civil Code of California (§ 1930) provides that when a thing is let for a particular purpose the hirer must not use it for any other purpose. If he does so he is liable for all damages and the lessor may treat the contract as rescinded. Under this section of the Code the lessor could only maintain an action for damages. He could not sue to recover rents received from the sublessee and have the original rescinded; nor could he on appeal change the theory of his action and insist that it was an action for damages.⁴⁷

§ 31. Second Lease.

A lessor can not lawfully execute a second lease to a stranger covering property held under a valid subsisting lease unless subject to the rights of the prior lessee.⁴⁸

§ 32. Lease of Homestead.

An oil and gas lease occupied as a homestead which granted the right to enter upon and operate the same for oil and gas, together with the right to lay pipes, erect power houses, stations, and fixtures necessary for the production of oil and gas, is such a grant of the use and occupancy of the homestead as requires the joint consent of the husband

⁴⁷ *Smith vs. United Crude Oil Co.*, 179 Cal. 570, 178 Pac. 141, and see 50 Cal. A. 466, 195 Pac. 434. In the lease under discussion in this case it was provided that all expenditures in connection with the boring of wells, erecting derricks, pumps, tanks, pipes and material, should be provided by the lessee at his own expense. The lessee expressly agreed that he would keep the premises clear and free of incumbrances and liens, particularly mechanics', material men's, and laborers' liens. There was no agreement in the lease against subletting and the lessee had a right to sublease portions of the land for the development of oil and a sublease could not be considered an incumbrance within the meaning of the lease.

⁴⁸ Equity has jurisdiction at the suit of the holder of a valid oil and gas lease, whose rights have become vested by the discovery of oil or gas, to remove as a cloud upon his rights a subsequent lease executed to a stranger covering the same tract of land. *Ohio Oil Co. vs. Greenleaf*, *supra* ⁽⁷⁾. See *Carbon Black Co. vs. Ferrell*, 76 W. Va. 300, 95 S. E. 544. Where the holder of a valid oil and gas lease has obtained vested rights by drilling wells and by the production of oil and gas, equity will enjoin the lessor from creating a cloud on his title by executing to a stranger another lease on the same property where it appears to be reasonably certain that such cloud will be created unless enjoined. *Castlebrook Co. vs. Ferrell*, *supra* ⁽⁶⁰⁾. A second lessee in an oil and gas lease of certain described lands had actual and constructive notice of a prior existing lease of the same lands. Such a second lessee acquired no rights under his lease as against the prior lease. Under these circumstances the original lessee had the right to have his title to the oil and gas under the leased lands quieted as against the second lessee and to have such second lessee enjoined from interfering with his right to enter upon the land and remove the oil. *Warren Oil Co. vs. Gilliam*, *supra* ⁽⁶⁵⁾; see, also, *Castlebrook Co. vs. Ferrell*, *supra* ⁽⁶⁰⁾. As to second lease by heirs see *Powell vs. Schoenfeld*, 262 Pa. St. 588, 106 Atl. 110; see *Bessho vs. General Pet. Corp.*, 186 Cal. 133, 199 Pac. 22; *Follette vs. Pacific Corp.*, 189 Cal. 205, 208 Pac. 295.

and wife. An oil and gas lease executed by one of the spouses alone is invalid.⁴⁹

§ 33. Interest and Rights of Lessee.

Oil and gas while in the earth, unlike solid minerals, are not the subject of ownership distinct from the soil, and a grant of the oil and gas is a grant not of the oil that is in the ground, but of such a part as the grantee may find and reduce to possession. It passes nothing except the right to explore for the same under the terms of the agreement or lease.⁵⁰ But the lessee is entitled to protection in his right to explore the premises for oil or gas; and he is entitled to an injunction restraining subsequent lessees of the same premises from destroying this right.⁵¹ Where it is stipulated that the lease is to continue during the time that oil or gas is found in paying quantities, and no oil or gas has been found during the term that the lessee has the right to exploit the land, the lease expires and may be annulled.⁵²

§ 34. Lessee's Right of Determination.

Where the lease does not fix the number of wells to be drilled for the development of the premises as contemplated, the lessee then has the right to determine the number of wells or the extent of the development, and his decision is conclusive on the subject so long as he acts honestly and in good faith upon sound business principles.⁵³ When oil is found the right to produce it becomes a vested right and the lessee will be protected in extracting it agreeably to the terms of the lease.⁵⁴

⁴⁹ Gillespie vs. Fulton Co., 140 Ill. A. 147; Ray vs. Brush, 112 Kan. 110, 210 Pac. 662; Carter Co. vs. Popp, — Okla. —, 174 Pac. 747, 210 S. W. 563; see Gary vs. McKinney, — Tex. C. A. —, 239 S. W. 283, 202 S. W. 103; McEntire vs. Thomason, — Tex. C. A. —, 210 S. W. 563; Haynie vs. Stovall, — Tex. C. A. —, 212 S. W. 792; but see Rumsey vs. Sullivan, 150 N. Y. S. 287, 212 S. W. 422; Griffin vs. Bell, — Tex. C. A. —, 202 S. W. 173; see, generally, Caudi vs. Wagoner, 184 Ky. 381, 212 S. W. 422; Robinson vs. Smalley, 102 Kan. 842, 171 Pac. 1155; see, also, Chisholm vs. Creek Co., 273 Fed. 589. The claimant of an unperfected unrestricted homestead right can not make a valid lease of the minerals therein. Bower vs. Higbee, 9 Mo. 239; Milliken vs. Carmichael, 134 Ala. 623, 33 So. 9; see Wadkins vs. Producers Oil Co., 227 U. S. 368; Parish vs. U. S., 184 Fed. 590; Chanslor-Canfield Co. vs. U. S., 266 Fed. 145; compare Tiernan vs. Miller, 69 Neb. 764, 96 N. W. 661; Anderson vs. Wilder, 83 Miss. 606, 35 So. 875.

⁵⁰ Warner vs. Page, *supra* (5); Kelley vs. Harris, *supra* (6); Lima Oil Co. vs. Pritchard, — Okla. —, 218 Pac. 866; but see Terry vs. Humphreys, — Okla. —, 203 Pac. 539, in which case it was held that an oil well and gas lease for a stated period or as long thereafter as oil or gas, or either of them, is produced from the demised premises, by the lessee, conveys "real property." In Daughetee vs. Ohio Oil Co., *supra* (32) it was held that where it was provided the lessee should hold the premises for a stated period and as much longer as gas and oil are found in paying quantities on the premises, the lease conveyed a freehold estate, for the reason that it may continue indefinitely. "An oil lease to have and to hold the same unto the party of the second part, his heirs and assigns, for the period of ten years from date hereof, with the right of renewal for a further term of ten years at the end of such term, or at the end of any subsequent term for which it may be renewed, gives the lessee the right of renewal in perpetuity." Becker vs. Submarine Oil Co., *supra* (4).

⁵¹ Downey vs. Gooch, *supra* (10).

⁵³ Gilbert vs. Bolds, *supra* (36); but see Kirlicks vs. Texas Co., — Tex. C. A. —, 201 S. W. 687; see, also, Brewster vs. Lanyon Zinc Co., *supra* (28); Alford vs. Dennis, *supra* (40); Grubb vs. McAfee, *supra* (6).

⁵⁴ Brookshire Co. vs. Casmalia Co., 156 Cal. 211, 103 Pac. 927; Dickey vs. Coffeyville Co., 69 Kan. 106, 76 Pac. 398.

§ 35. Lessee Can Not Set Up His Own Default.

A lessee in an oil and gas lease can not set up his own default in order to terminate the lease or escape liability under its provisions. If he fails to perform the covenants of the lease it lies with the lessor to declare a forfeiture.⁵⁵

§ 36. Covenants Construed in Favor of the Lessee.

In oil and gas leases the compensation of the lessor generally is a royalty. The covenants to be performed by the lessee which relate to the right to drill or explore for oil or gas generally are construed most strongly in favor of the lessor. But this rule has its limitations. When a lessee has faithfully performed all his covenants and has discovered oil in paying quantities and the lessor is receiving the royalties as the lease contemplates, the lessor can not then invoke this rule to aid him in dispossessing the lessee. The lessee having performed his covenants he thereby obtained a vested interest in the oil and gas in the leased premises because of his exclusive right to drill, and the lessee holds such interest as security against the lessor.⁵⁶

§ 37. Forfeitures.

Forfeitures are not generally favored by the law; but forfeitures which arise in oil and gas leases by reason of the neglect of a lessee to develop or operate the leased premises are favored because of the peculiar character of the minerals sought to be produced. Perhaps in no other class of leases is prompt performance of contract so essential to the rights of the parties, or delay by one party likely to prove so

⁵⁵ *Ohio Valley Co. vs. Irvin Co.*, *supra* ⁽⁶⁾; see *Warren Co. vs. Gilliam*, *supra* ⁽⁶⁾; *Monarch Co. vs. Richardson*, 124 Ky. 602, 99 S. W. 668; *Maud Co. vs. Bodkin*, 75 Okla. 6, 180 Pac. 959; see, also, *Becker vs. Submarine Oil Co.*, *supra* ⁽⁴⁾. Where the lease provides that if the premises should not be operated the lease should be void the word "void" means "voidable" at the election of the lessor and he must do some act evincing an intention to avoid the lease before it can be considered void or terminated. Such provisions are for the benefit of the lessor and he has an option to discontinue the lease on default of the lessee, or affirm the continuance of the contract. If the lease provides that the lessee's failure to complete a well within a stated period or any default in the covenant thereof to pay a certain yearly rental should render the lease null and void and all rights and claims should therefrom cease, still the lessee by his own default can not relieve himself from the liability already incurred. *Lavery vs. Mid-Continent Co.*, 62 Okla. 266, 112 Pac. 737; see, also, *McKean Co. vs. Walcott*, *supra* ⁽²⁾. By the terms of an oil and gas lease the lessee, an oil company for a valuable consideration, specifically undertook to commence and with diligence drill a well on the premises into a designated sand. The lease contained a clause providing that a failure to commence and complete said well should work a forfeiture and render the lease null and void. The forfeiture provision was for the benefit of the owner of the leasehold interest and gave him the option to declare a forfeiture upon the failure of the oil company to discharge its obligation to drill. The oil company could not, by virtue of the forfeiture clause and without the consent of the owner, terminate the contract by its own default and thereby escape liability for resultant damages. *Lavery vs. Mid-Continent Co.*, *supra*.
⁵⁶ *Burgan vs. South Penn Co.*, 243 Pa. St. 128, 89 Atl. 823. A covenant relating to the drilling of new wells, the erection of new derricks and buildings is a covenant running with the land. *Bradford Oil Co. vs. Blake*, 113 Pa. St. 83, 4 Atl. 218; *Pierce Ass'n. vs. Woodrum*, *supra* ⁽⁴²⁾.

injurious to the other.⁵⁷ The lessee has a right to regard his own interest as well as that of the lessor. In short the diligence required of the lessee involves such a course of conduct upon his part as operators of ordinary diligence would pursue, having in mind the securing of the financial benefits sought by both lessor and lessee.⁵⁸

§ 38. What Warrants Forfeiture.

To warrant a forfeiture it must affirmatively appear from all the circumstances that the lack of diligence "is both certain and substantial."⁵⁹

§ 39. Forfeiture Can Not Be Arbitrarily Exercised.

The right of a lessor to forfeit the lease for nondevelopment can not be arbitrarily exercised. The lessor first must demand of the lessee that he develop in good faith the leased lands. If, after notice and demand, the lessee fails to begin the development within a reasonable time the lessor may then have the lease forfeited.⁶⁰ A mere discovery of a "dry hole" does not end the lease under a forfeiture clause for failure to drill a well within a stipulated time.⁶¹ The driving of a stake to indicate the location of a well and the driving of another stake locating a place to set a boiler to drive a drilling machine on the part of the lessee, do not constitute a commencement of operations to drill within the provision of the lease.⁶²

⁵⁷ Hughes vs. Busseyville, *supra* ⁽⁶⁰⁾; Soaper vs. King, 167 Ky. 121, 180 S. W. 46; see, also, Alford vs. Dennis, *supra* ⁽⁴⁶⁾; Rembarger vs. Losch, *supra* ⁽⁴⁰⁾. An oil and gas lease will be strictly construed against the lessee and although under the general rule forfeitures are not favored, they are in fact favored in contracts of this character. Stephenson vs. Slitz, — Tex. C. A. —, 255 S. W. 812. A forfeiture clause, for the nonpayment of rent or for failure to fulfill a covenant, is for the benefit of the lessor, and is enforceable only at his option. Such a covenant is not self enforcing. Craig vs. Thompson, *supra* ⁽⁶⁵⁾. The right of a lessor to forfeit the lease must be promptly asserted or it will be treated as a waiver. The tendency of the later judicial decisions is to frown on forfeiture where the rights of the parties insisting thereon can otherwise be adequately protected. Bloom vs. Rugh, *supra* ⁽⁶⁶⁾; Wellsville Co. vs. Miller, 44 Okla. 493, 145 Pac. 344; Pierce Corp. vs. Schacht, *supra* ⁽⁴⁹⁾; see, also, Indiana Co. vs. McCrory, *supra* ⁽⁴⁷⁾. A person entitled to the forfeiture and the consequent right of re-entry may waive such right or he is estopped by his own conduct from asserting the right. And any fact properly evidencing the intention of a lessor to waive any right of forfeiture is admissible in an action by an assignee of the lessor to forfeit the lease. Munsey vs. Marnet Co., *supra* ⁽⁴⁶⁾. The true rule undoubtedly is that the right to declare a forfeiture must be distinctly reserved; that the proof of the happening of the event on which the right is to be exercised must be clear; that the party entitled to do so must exercise his right promptly; and that the result of enforcing the forfeit must not be unconscionable. Craig vs. Cosgrove, — Pa. St. —, 121 Atl. 408. In Taylor vs. Hamilton, *supra* ⁽²⁾, the court says: "It is a general rule that forfeitures are discountenanced in the law; but where, as in the case of the exploration and development of oil territory, the profits to be derived frequently depend upon the exercise of diligent prosecution of the work and continuous operation of the completed plant, the only protection afforded the owner of such property is the cancellation of the permit where its possessor has been grossly neglectful of mutual interests as between him and such owner, or wilfully has been guilty of dilatory practices because of speculative or selfish interests, or otherwise, which amounts to an abandonment. (Acme Oil & Min. Co. vs. Williams, 140 Cal. 681, 74 Pac. 296.) Having to do with the subject of forfeiture of oil leases, it is said in Risch vs. Burch, 175 Ind. 621, 95 N. E. 123, that, 'oil and gas leases or contracts are in a class by themselves, and the ordinary rule that forfeitures are not favored does not apply with full force to them if at all. The provisions for a forfeiture usually found in them are generally held to be for the benefit of the landowner and clearly enforceable by him where the lessee has done nothing to carry out the purpose of exploration, and has failed to make payments for the right to do so.' And in this connection see, also: Gillespie vs. Bobo, 271 Fed. 641; Dill vs. Frazee, 169 Ind. 53, 79 N. E. 971; Bell vs. Kilburn (Ky.), 234 S. W. 730; Clutter vs. Wisconsin, etc., Oil Co., — Tex. C. A. —, 233 S. W. 322; Gasaway vs. Teichgraber, 107 Kan. 340, 191 Pac. 282; Jenkins vs. Williams (Ky.), 229 S. W. 94."

⁵⁸ Young vs. Forest Co., *supra* ⁽²⁹⁾; Priddy vs. Thompson, 204 Fed. 955; Lindlay vs. Raydure, 239 Fed. 928; see Huggins vs. Daley, *supra* ⁽³⁾; Backer vs. Penn. Co., 162 Fed. 627; Florence vs. Orman, 19 Colo. A. 79, 73 Pac. 628; Rawlings vs. Armel, 70 Kan. 778, 79 Pac. 683; Wagner vs. Mallory, 169 N. Y. 501; Frank Co. vs. Bellevue Co., 29 Okla. 719, 119 Pac. 260.

⁵⁹ Becker vs. Submarine Oil Co., *supra* ⁽⁴⁾.

⁶⁰ Brewster vs. Lanyon Zinc Co., *supra* ⁽²⁸⁾; Becker vs. Submarine Oil Co., *supra* ⁽⁴⁾.

⁶¹ Ohio Oil Co. vs. Irvin Co., *supra* ⁽⁸⁾.

⁶² Henning vs. Wichita Co., 100 Kan. 255, 164 Pac. 298.

§ 40. Immediate Development Presumed.

From the fact that lessors in oil and gas leases usually receive no consideration except in royalties from oil and gas after their discovery, the presumption always is that such leases are made for the purpose of immediate development, unless the contrary appears from the terms of the lease itself.⁶³

§ 41. Abandonment.

When it is claimed that a right under an oil and gas lease has been lost by abandonment and upon which forfeiture of the lease is sought the issue of intention rarely is, if ever, absent. An intention to abandon is to be found by a jury from a consideration of the nature and extent of the undertaking, the conduct of the parties, and what they did do or failed to do in that respect. The rule does not mean that the jury shall find that a specific mental reservation was reached by the person so charged to so abandon the right, as such a finding never could have a basis in the testimony except by admission or confession.⁶⁴

⁶³ Where a lease of oil and gas lands, with royalty to the lessor on the product is the sole and only consideration therefor it necessarily is implied, as of the essence of the contract, that the lessee shall work the wells with reasonable dispatch, for their mutual advantage. *Acme Co. vs. Williams*, *supra* (49); *Daughettee vs. Ohio Oil Co.*, *supra* (33); *Burgan vs. South Penn. Co.*, *supra* (50); *Parish Fork Co. vs. Bridgewater Co.*, 51 W. Va. 583, 42 S. E. 655. There is an implied condition or covenant of every lease of land for the production of oil therefrom that when the existence of oil in paying quantities is made apparent, the lessee shall put down as many wells as may reasonably be necessary to secure the oil for the common advantage of both the lessor and the lessee. *Highfield Co. vs. Kirk*, *supra* (65). The fluctuating and uncertain character and value of oil and gas lands render it necessary for the protection of the land-owners that the properties should be developed as speedily as possible. The lessee for such purpose will not be permitted to hold the land for speculative or other purposes an unreasonable length of time for a mere nominal rent when a royalty on the product is the chief object for the execution of the lease. *Hughes vs. Busseyville Co.*, *supra* (9). See cited case as to the application of the rule to the effect that an oil lease contains an implied covenant on the part of the lessee to develop the leased premises, depends on circumstances and on the intention of the parties. An implied covenant to develop can not be read into a lease of land for oil and gas where the territory had not before been developed and its productive value was not known. Where the object of the operations contemplated by the lease is to obtain a benefit or profit for both lessor and lessee, neither is in the absence of a stipulation to that effect, the arbiter of the extent to which, or the diligence with which, the operation shall proceed, but both are bound by the standard of what in the circumstances, would reasonably be expected of an operator of ordinary prudence, having regard to the interest of both. *Indiana Co. vs. McCrory*, *supra* (17); *Wapa Co. vs. McBride*, 84 Okla. 184, 201 Pac. 984; *Cotner vs. Munday*, *supra* (20).

⁶⁴ *Munsey vs. Marnet Co.*, *supra* (16). The distinction between "forfeiture" and "abandonment" as applied to oil and gas conveyances and leases is so shadowy that in discussing the one necessarily the conditions of the other are involved. But one distinction is that "abandonment" rests on the intention of the parties, while "forfeiture" does not rest upon the intent to release the premises, but is an enforced release. A vested title can not ordinarily be lost by abandonment unless there is satisfactory proof of an intention to abandon. The existence of an intent to waive or abandon the right to drill for oil and gas under the lease is a question of fact, and the proof would authorize the conclusion that there was no such intention, then a court would not be justified in decreeing a forfeiture of the lease. *Fisher vs. Crescent Co.*, — Tex. C. A. —, 178 S. W. 905; *Hall vs. McClesky*, — Tex. C. A. —, 228 S. W. 1004; *Garrett vs. South Penn. Co.*, 66 W. Va. 587, 66 S. E. 541; *Wisconsin Texas Co. vs. Clutter*, — Tex. C. A. —, 258 S. W. 265. Abandonment may be more readily found in cases of oil and gas leases than in most other instances. The rights granted under such leases are for exploration and development. The title and interest are inchoate until oil or gas is found in quantities warranting operation, and accordingly a lessee will not be permitted to fail in development and hold the lease for speculative or other purposes except in strict compliance with his contract, and for a valuable and sufficient consideration other than the development. *Harris vs. Riggs*, 63 Ind. 208, 112 N. E. 36. When the lease has been abandoned by the lessee, the lessor has three remedies, any one of which he may pursue. The lessor may go into a court of equity to cancel the lease and recover incidental damages; he may in a separate action at law sue for damages for breach of the contract, or he may treat the lease as rescinded and sue to recover possession of the property. *Millar vs. Mauney*, — Ark. —, 234 S. W. 498. It may be accepted as a principle of law that even in the case of a lease creating a vested interest in the lessee, the doctrine of abandonment may be legally asserted and proved in the ordinary manner as a defense to the claim of prior lessee. Much stronger would be the ground for recognizing it as a defense if the instrument in a controversy in equity may not have created a vested interest. *Burke vs. North*, 296 Fed. 259.

§ 42. Intention.

Whether an oil and gas lease had been terminated by abandonment on the part of the lessee and the acceptance of or reentry upon the premises by the lessor is a question of intention. A lease so terminated is said to have come to its end by operation of law, the legal result arising from the act of the parties. The intention on the part of the lessee to abandon and on the part of the lessor to resume possession of the premises on his own account and treat the lease as having been surrendered and as ascertained from their acts and conduct is the test.⁶⁵ Unexplained cessation of work after sinking a dry well would be sufficient proof of abandonment.⁶⁶

§ 43. Cotenants.

Cotenants are owners of the whole of part and of the whole.⁶⁷ None of the cotenants has the exclusive right to any determinate part of the property. The owner of an undivided interest in a tract of land, nor a majority of such owners, has not the right to exploit such land for oil and gas by making a lease therefor without the consent of all the cotenants. Such right can not be conferred upon such a lessee. Such a lease may be valid as to the lessor but it is voidable as against the other cotenants.⁶⁸

§ 44. Rights of Cotenant.

Each cotenant may enter upon the premises and operate the same for oil and gas.⁶⁹ If his efforts result in a "dry hole" he must sustain the entire loss; but, if successful, he must proportionately share the profits with the excluded cotenants.⁷⁰

§ 45. Ratification of Voidable Lease.

The pretermitted cotenants may, if they so elect, permit the lessee to continue operations under the lease and require him to account for

⁶⁵ *Grubb vs. McAfee*, *supra* (6). Where an oil and gas lease is abandoned by the lessee, he can not thereafter revive the same nor claim nor enforce any rights thereon without first securing the consent of the lessor or procuring a renewal of the lease. *Harris vs. Riggs*, *supra* (64); see, also, *Ohio Oil Co. vs. Detamore*, 165 Ind. 243, 73 N. E. 906.

⁶⁶ *Foster vs. Elk Fork Co.*, 90 Fed. 178; *Strange vs. Hicks*. — Okla. —, 188 Pac. 347. *Gulf Co. vs. Carroll*, 145 La. 299, 82 So. 277; see *Gulf Co. vs. Hayne*, *supra* (1); *Paxton vs. Benedum-Trees Co.*, 80 W. Va. 187, 94 S. E. 472. A patent issued to two or more persons creates presumptively a tenancy in common as between them and third parties. *Frisbie vs. Marques*, 39 Cal. 451, affirmed in 101 U. S. 473.

⁶⁸ *Id.* *Zeigler vs. Brennehan*, 237 Ill. 15, 86 N. E. 597; see *Compton vs. Peoples Co.*, 75 Kan. 572, 89 Pac. 1039; *York vs. Warren Co.*, 191 Ky. 157, 229 S. W. 116. A lease of an entire tract made by one cotenant is binding on the other tenants when ratified by them. One method of ratification is acceptance of benefits under the lease by the cotenants. *Bessho vs. General Petroleum Corp.*, *supra* (48).

⁶⁹ *Williamson vs. Jones*, 43 W. Va. 562, 27 S. E. 411; see, also, *McCord vs. Oakland Co.*, 64 Cal. 134, 27 Pac. 863. Several cotenants of an oil and gas lease assigned the lease to an operator who was to deliver to them a part of the product. One of the joint owners did not join in the assignment, and notified the assignee not to deliver any oil to his cotenants. The court held (1) that the party not joining in the assignment was not entitled to his share of the oil without proving that his cotenants had received more than their share; (2) that if he chose to affirm it, he must take his share with the others upon a distribution of the royalty after deducting all proper charges and expenses; (3) that if he did not affirm the lease, he had no claim to any share of the royalty, and could only look to the lessee as a cotenant who has not acquired his title. *Enterprise Co. vs. National Co.*, 172 Pa. St. 421, 33 Atl. 687; *Gillette vs. Mitchell*. — Tex. C. A., — *supra* (46).

⁷⁰ *Id.* See *Silver King Co. vs. Conkling Co.*, 255 Fed. 740; *Job vs. Potton*, L. R. 20 Eq. 84.

such proportion of the royalties as their interest in the oil in place bears to the whole.⁷¹

§ 46. Mining Partnership.

There is no presumption of a partnership from cotenancy.⁷² Drilling the well by their joint efforts—this fact of itself alone—whether as cotenants, or in order to become cotenants, does not make them mining partners. Such an arrangement lacks the elements of partnership.⁷³ Where tenants in common cooperate in developing a lease for oil and gas, each agreeing to pay his part of the expenses and to share in the profits or losses, they constitute a mining partnership.⁷⁴

§ 47. Life Estates.

Neither a widow owning a dower interest in land nor a life tenant has the power to make a lease of land under which oil or gas or other minerals can be removed from the land as against the remainderman.⁷⁵ Oil and gas well drilling by the lessee after the death of the lessor are regarded as open mines at the time of the lessor's death and the life tenant will be entitled to the rents, issues and profits reserved to the lessor accruing from such wells during the life tenancy.⁷⁶ An ante nuptial agreement by which after marriage the wife should hold and enjoy her separate estate does not cut the surviving husband out of his curtesy or his inheritance. It does not deprive him nor his legal heirs from the right to moneys received as royalties on oil for well drilled under a contract with and in the lifetime of the wife.⁷⁷

§ 48. Open Mines.

Mining leases do not constitute a sale of any part of the land, and the mineral derived from the usual operation of open mines constitutes the rents and profits of the land and belong to the tenant for life or years; but this rule does not apply to unopened mines in the absence of a contract for opening and leasing them.⁷⁸

§ 49. Assignees.

A right of action for a breach of the covenant of an oil and gas lease

⁷¹ Paxton vs. Benedum-Trees Co., *supra* (67).

⁷² Neill vs. Shamburg, 158 Pa. St. 263, 27 Atl. 992.

⁷³ Gillespie vs. Shufflin, — Okla. —, 216 Pac. 132.

⁷⁴ Barrett vs. Buchanan, — Okla. —, 213 Pac. 734; see, also, Madar vs. Norman, 13 Ida. 585, 92 Pac. 572.

⁷⁵ Prout vs. Hoy Oil Co., 263 Ill. 54, 105 N. E. 26; see, generally, Campbell vs. Lynch, *supra* (30).

⁷⁶ Bramer vs. Bramer, 84 W. Va. 168, 99 S. E. 329.

⁷⁷ Id. See, generally, Cochran vs. Gulf Co., 139 La. 1010, 72 So. 718.

⁷⁸ Von Baumbach vs. Sargent Co., *supra* (3). The lessee in an oil and gas lease after the death of the lessor entered upon the leased premises and drilled and produced oil and gas. Oil and gas wells so drilled are regarded as open mines at the time of the lessor's death. The life tenant will be entitled to the rents, issues and profits reserved to the lessor accruing from such wells during the life tenancy. Bramer vs. Bramer, *supra* (76). Under a will devising an interest in mineral lands under lease for mining operations, royalties under such a lease earned previous to but payable after the death of the decedent are payable to the life tenant. Poole vs. Union Trust Co., 191 Mich. 162, 167 N. W. 430; see, also, Seager vs. McCabe, 92 Mich. 186, 52 N. W. 299; and see Priddy vs. Griffith, 150 Ill. 562, 37 N. E. 999. The reason of the rule permitting dower in opened mines is that the land had been devoted to mining purposes by the owner of the fee during his life; and the mode of enjoyment and source of profit fixed and determined by him. In such case mining is a mode of enjoyment fixed by the owner and to extract and take the minerals is but to take the accruing profits from the land. Daniels vs. Charles, 172 Ky. 238, 189 S. W. 194.

is assignable. No particular form of words is essential to pass the right of action. Words manifesting a clear intention to assign are sufficient.⁷⁹

§ 50. Rentals.

An assignee of an oil and gas lease which contains a stipulation to the effect that all covenants and conditions therein shall be binding on the assigns of both parties, is liable for the rental payment prescribed in the lease so long as he retains possession under the lease.⁸⁰

§ 51. Liability of Assignee for Rent.

Where a lease of land for oil and gas provides that a certain sum shall be paid each year as royalty on the gas produced from each well and marketed off the premises, and the lessee operates the lease, markets the gas from wells thereon for a portion of the year, and thereafter assigns the lease, the assignee, in the absence of a special contract, is not liable for the royalties accruing on the wells, the product of which was marketed prior to the assignment of the lease, regardless of when these royalties became due and payable but the assignee of the lease is liable for the royalties accruing during the time he markets the product and enjoys the estate.⁸¹

§ 52. Action Against Assignee.

Where a lessor in an oil and gas lease brings an action against an assignee to recover damages for failure to drill wells upon the lease lands in order to prevent drainage of the oil in such leased lands through wells drilled upon adjacent land, it is necessary for the lessor to prove (1) the assignment and transfer of the lease to the assignee, the defendant in the suit; (2) that the assignee's operations on the lessor's land were under and by virtue of the lease. This, because the action being based upon a breach of an implied covenant to develop, it can not be maintained against any person not a party to the lease.⁸²

§ 53. Damages.

It has been held that in an action for damages for a breach of the contract the measure of damages which the well driller was entitled to recover was (1) the expense necessarily incurred in hauling his drilling rig and machinery from where they were to the well that he began drilling; (2) the expense necessarily incurred in rigging up and drilling to the point where drilling was stopped; (3) reasonable compensation for services in removing the rigging and drilling machinery; (4) reasonable compensation for the enforced idleness of the rig and machinery; (5) the reasonable value of the well driller's services lost

⁷⁹ *Millan vs. Bartlett Co.*, 78 W. Va. 367, 89 S. E. 711.

⁸⁰ *Ardizzone vs. Archer*, — Okla. —, 177 Pac. 554, 178 Pac. 263; see, also, *Oklahoma Co. vs. Winship*, — Okla. —, 200 Pac. 849; *Texas Co. vs. Bruce*, — Tex. C. A. —, 233 S. W. 539; see, also, *Gibson vs. Texas Co.*, — Tex. C. A. —, 239 S. W. 671. While an assignee of an oil and gas lease is not liable for the consequences of the failure of his assignor to drill a well on the leased premises before the assignment of the lease, yet if the assignee continues to pay the stipulated delay rental in lieu of drilling after the acceptance of the assignment after he acquires title, he is liable for the consequence of his own failure. *Hefner vs. Light Co.*, *supra* ⁽⁷⁹⁾; see *Pierce Ass'n vs. Woodrum*, *supra* ⁽⁴²⁾.

⁸¹ *Columbus Co. vs. Knox Co.*, 91 Ohio St. 35, 109 N. E. 529.

⁸² *Steele vs. American Co.*, *supra* ⁽³²⁾.

during the time he remained on the premises at the request of the lessee of the land.⁸³

§ 54. Invalid Lease.

Where a lessee, with no intention to violate any law or do any wrongful act, takes possession of land under a lease owned by him, and in good faith, believing in his title, proceeds to develop the premises for oil and gas purposes and it later develops that his lease was invalid, the measure of damages would be the price of the oil and gas at the surface or in the pipe line or tanks, less the reasonable cost of producing the same.⁸⁴

§ 55. Adverse Interest Established.

Where a lessee in good faith takes peaceable possession of the leased premises, believing that the lessor owned the entire title in the premises, and an action is brought by another person, who establishes an interest in the land, the measure of damages arising in favor of the party establishing a partial interest in the premises is the value of his share of the oil at the surface less the reasonable cost of production.⁸⁵

§ 56. Failure to Develop.

A lessor of lands for the production of oil and gas in an action against the lessee for failure to properly develop the leased premises, is entitled only to such damages as he sustained by any failure on the part of the lessee to exercise an honest judgment in proceeding with the necessary explorations on the leased lands and the extraction of oil therefrom, taking into consideration (1) the subject matter of the lease; (2) the character of the mineral products; (3) the nature of the oil-bearing sand, whether dense or soft and porous; (4) developments on contiguous lands, whether by the lessee or different operators; (5) the cost of drilling; (6) proximity to market; (7) facilities for marketing; (8) current prices, whether high or low; (9) location of lands; (10) and such other conditions attendant on the operations as may explain the necessity for prompt, or excuse for delayed action in prosecuting such development. In such case the lessor assumes the burden of showing, and by clear and convincing proof, must, to avail him, show by witnesses having experience, skill, and engaged in similar operations that the lessee, having due regard for the advantage and profit of him-

⁸³ *Letcher vs. Maloney*, 70 Okla. —, 172 Pac. 972. For cases involving damage to the surface by another's oil operations or negligence, see *Duvall vs. White*, 46 Cal. A. 305, 189 Pac. 324; *Northrup vs. Eakes*, — Okla. —, 178 Pac. 266; *Walters vs. Prairie Co.*, 85 Okla. 77, 204 Pac. 906; *Kay & Kiowa Co. vs. Moore*, — Okla. —, 221 Pac. 511; *Avery vs. Wallace*, — Okla. —, 224 Pac. 515; *Indiana Co. vs. Christensen*, 188 Ind. 406, 123 N. E. 789; see, generally, *Brennan Co. vs. Cumberland*, 29 App. D. C. 554; *Kuhn vs. Jewett*, 32 N. J. Eq. 647; *Texas Co. vs. Bellar*, 51 Tex. C. A. 154, 112 S. W. 323; *Texas Co. vs. Clark*, — Tex. C. A. —, 182 S. W. 351. The value of the land immediately before the overflow and its value immediately afterwards is a proper way to arrive at the amount of damage to the land. *Avery vs. Wallace*, *supra*. In a suit for damages for the destruction of a growing crop, such damages are to be estimated as of the time of the injury, to be applied as compensation for the value of the crops in the condition in which they were at the time of the destruction. *DeArman vs. Oglesby*, 49 Okla. 118, 152 Pac. 356; *Producers Co. vs. Maple Leaf Co.*, 82 Okla. 120, 198 Pac. 577.

⁸⁴ *Barnes vs. Winona Oil Co.*, 83 Okla. 253, 200 Pac. 985.

⁸⁵ *Minshall vs. Berryhill*, 83 Okla. 100, 205 Pac. 932.

self, and the lessor, has not, surrounding circumstances considered, exercised ordinary diligence in conducting such operations.⁸⁶

§ 57. Liquidated Damages.

A covenant in a lease that the lessee should commence operations by a certain date and on failure to do so he should pay the lessor a stated sum for each and every month in which he fails to commence such operations is not a penalty but liquidated damages. In an action on such a lease to recover the amount of the monthly payments, proof of the amount of damages is unnecessary as the amount is fixed by the terms of the lease. Damages for breaches of contract touching future interests in oil wells of unknown value are of such remote and speculative value as to bring them peculiarly within the rule that the parties should have the right to fix them by mutual agreement. It would be impossible to calculate with any degree of certainty the amount of damage sustained by a lessor by reason of the breach of the covenant of such a lease by the lessee.⁸⁷

§ 58. Partition.

A lessee in an oil and gas lease can not contest the title of his lessor as an owner in indivision with others and compel him and his co-owners to make a judicial partition in kind of the leased property.⁸⁸

§ 59. Widow's Rights.

The owner of land leased the same for oil and gas purposes and died before any wells were drilled. Partition was had of the leased land and dower lands were assigned to the widow and to the other heirs, respectively. Subsequently drilling operations were commenced and numerous producing wells drilled. In such case the wells drilled by the lessee

⁸⁶ Grass vs. Big Creek Co., 75 W. Va. 719, 84 S. E. 750; see Clark vs. Cooper, 197 Ky. 530, 247 S. W. 929. It was stipulated in an oil and gas lease that the lessee should develop the land by boring for oil and gas and should drill a well to a certain depth. The lessee failed to drill the well to the specified depth and abandoned the well before reaching such depth. The lessor was entitled to recover as damages for a breach of the lease the reasonable value of the lease, as this must be regarded as the actual value paid by the lessor to have the well drilled as specified. Henry Oil Co. vs. Head, — Tex. C. A. —, 163 S. W. 311. A lessor in an oil and gas lease may maintain a suit against the lessee to recover damages for injuries sustained by him because of the failure of the lessee to drill off-set wells necessary to save the oil and gas in the leased land and to prevent it from being drained by wells on adjacent lands. The damages sought in such an action is for diminution of the royalties by reason of such drainage. Steele vs. American Co., *supra* ⁽³²⁾.

⁸⁷ Allen vs. Narver, *supra* ⁽⁴²⁾. There is some conflict in the decisions of the Courts of Civil Appeal of Texas as to whether or not, under any circumstances, a contract can specifically be performed when it carries with it a clause providing for "liquidated damages." Most of these courts hold that a contract of this sort is a mere option, where it provides for "liquidated damages" under conditions showing an express or implied agreement on the part of the vendor to accept such damages in lieu of a performance of the contract. Texlounana Co. vs. Wall, — Tex. C. A. —, 257 S. W. 875.

⁸⁸ Gulf Co. vs. Hayne, *supra* ⁽¹⁾; see Campbell vs. Lynch, *supra* ⁽³⁰⁾, as to partition between copartners. Known oil lands, like mines, can not be judicially partitioned in kind at the suit of one of the coowners or by a creditor of a coowner. A suit for partition usually results in a decree for the sale of the property. Royston vs. Miller, 76 Fed. 50; Mitchell vs. Cline, 84 Cal. 409, 24 Pac. 164. This particularly as to oil and gas lands. Hall vs. Vernon, 47 W. Va. 295, 34 S. E. 764; but see Daingerfield vs. Caldwell, 151 Fed. 554. The partition may be voluntary. Dunlap vs. Jackson, — Okla. —, 219 Pac. 314; see Tonopah Co. vs. Tonopah Co., 125 Fed. 400; Empire State Co. vs. Bunker Hill Co., 131 Fed. 591; Mullins vs. Butte H. Co., 25 Mont. 525, 65 Pac. 1004.

on the portion of the land assigned to the widow as and for her dower are not mines nor wells worked by her, since the working right is held by the lessee even though they may be deemed mines opened in her husband's life. She is not entitled to the entire royalties and rents accruing from such wells nor is her dower right limited to such royalty and rents as subjects thereof. She is entitled to dower to whatever its extent may be when the royalties and rents accrue from all the wells drilled on the entire tract of land covered by the lease.⁸⁹

§ 60. Lessee's Rights.

On the death of a lessor of an oil and gas lease the leased lands descend to the lessor's heirs burdened by the right of the lessee. The latter is the complete master of the situation *quo ad* the oil and gas, having right to drill wherever he chooses on the leased premises. A partition of the land among the heirs in no way affects the lessee's right or liberty in that respect. A lease on a single tract of land subsequently broken into several subdivisions by a partition or by conveyances is not segregated and converted into as many distinct leases as there are subdivisions. That could be done only with the consent and cooperation of the lessee. As to him the lease and its subject, the tract of land, are entireties. After, as well as before, the division, there is one lease of one tract, yielding, when productive, one royalty or rental in the aggregate. The rent or royalty is an entire thing arising out of the whole tract of land. Though the royalty oil or gas rental comes from a certain well or wells, it is not legally the rent or return of the wells or the severed tract of land on which they are located. It is rent of the whole tract covered by the lease. In legal contemplation the wells are not drilled on the several portions as under the lease on that portion, but they are drilled under the lease as made, which binds and holds all the parties after the division as it did before.⁹⁰

§ 61. Purchaser's Rights.

A tract of land covered by an oil and gas lease was subdivided in a proceeding in bankruptcy. Each subdivision was sold separately by the trustee to different purchasers. The purchasers of these respective parcels of land from the trustee bought all of the estate therein subject only to the right of the oil and gas lessee to explore for and produce the oil and gas. This right conferred upon the lessee is the same as would have existed in the different purchasers had there been no lease. From this it follows that the purchaser of each subdivision is entitled to the royalties on all of the oil produced from wells drilled on his subdivision and royalties from the oil or gas must be paid to the owner of the subdivision upon which the wells are drilled from which the production is had.⁹¹

⁸⁹ Campbell vs. Lynch, *supra* (36).

⁹⁰ Id.

⁹¹ Pittsburgh Co. vs. Ankrom, *supra* (46); see Osborn vs. Arkansas Co., 103 Ark. 175, 146 S. W. 122; Fairbanks vs. Warrum, *supra* (53); Ohio Co. vs. Ullrey, 68 Ohio St. 259, 67 N. E. 494; Pierce Oil Co. vs. Schacht, *supra* (46); Wettengel vs. Gormley, *supra* (46); a case containing an extensive review of cases bearing upon this principle; see, also, Gillette vs. Mitchell, *supra* (46).

§ 62. Cancellation and Rescission.

A lessor of an oil and gas lease, invoking the jurisdiction of a court of equity to cancel and rescind the lease for the breach of an implied covenant, must come into court with clean hands. He must act with reasonable diligence after the discovery of his right to a forfeiture of the lease on account of its breach.⁹²

§ 63. Laches.

The doctrine is well settled, both in the English courts and the courts of this country, as to the relentless enforcement of the doctrine of laches where the subject of controversy is mining and oil property purely speculative in value.⁹³ Inexcusable delay for a period short of the time provided by the statute of limitations may constitute laches, and is an equitable defense wholly independent and outside of such statute, whenever the relief sought is wholly equitable.⁹⁴ Delay can not be excused except by some actual hindrance or impediment caused by the fraud or concealment of the party in possession.⁹⁵ Mere lapse of time never constitutes laches, but in addition the court must find that it would be inequitable to grant the relief prayed for.⁹⁶ The mere institution of a suit does not relieve the plaintiff of the charge of laches.

⁹² *Pierce Corp. vs. Schacht*, *supra* (46); see *Michigan Pipe Line Co.*, 111 Fed. 284; *Washburn vs. Gillespie*, 261 Fed. 41; *Indiana Co. vs. McCrory*, *supra* (47); *Wellsville Co. vs. Miller*, *supra* (47). In case of a breach of an implied covenant to properly develop an oil and gas lease the lessor must notify the lessee and demand that the lessee comply with the implied covenants before a court will grant a forfeiture. *Papoose Oil Co. vs. Tainey*, 89 Okla. 110, 213 Pac. 882. Mere inadequacy of consideration or other inequality in the terms of a lease does not of itself constitute a ground to avoid it in equity. See *Smith vs. McCullough*, 285 Fed. 699. In a suit to cancel an oil and gas lease for failure to operate an existing well and for other reasons, that lessor had received royalties from the well could not operate as an estoppel, nor affect his right to sue for cancellation for failure to comply with other obligations of the lease. *Louisiana Co. vs. Kendall*, 155 La. 1, 98 So. 862. In many of the cases it is pointed out that where the conditions of the instrument giving a right to explore for oil provide for the cancellation thereof at a fixed time unless a certain rent be paid for an extension of the time within which to commence operations, such extension becomes entirely optional with the licensee, and that equity will not relieve against his failure to exercise the option in strict accordance with its terms. *Taylor vs. Hamilton*, *supra* (42).

⁹³ *Twin Licks Co. vs. Marbury*, 91 U. S. 587; *Johnson vs. Standard Co.*, 148 U. S. 360; *Gaines vs. Chew*, 167 Fed. 630; *Taylor vs. Salt Creek Co.*, 285 Fed. 532; *Hodson vs. Federal Oil Co.*, 285 Fed. 552; *Beck vs. Finley*, 77 Okla. 213, 187 Pac. 488; see *Hazzard vs. Johnson*, *supra*. In some cases the diligence required is measured by months rather than by years. And in some others a delay of two, three or four years has been held to be fatal. *Patterson vs. Hewitt*, 195 U. S. 309; *Starkweather vs. Jenner*, 216 U. S. 524; *Bacon vs. Neill*, 283 Fed. 717. Under the general equity principles, not the time when the fraud is committed, but when it is discovered, or might have been discovered by the exercise of ordinary diligence, fixes the time when the cause of action accrues. *Tilden vs. Barber*, 168 Fed. 591; *Taylor vs. Salt Creek Co.*, *supra*. In *Jackson vs. Jackson*, 175 Fed. 719, a delay of three years in asserting an interest in oil lands was held laches.

⁹⁴ *Jewell vs. Trilby Mines*, 229 Fed. 298; *Scruggs vs. Decatur Co.*, 86 Ala. 173, 5 So. 440; *Great West Co. vs. Woodmas Co.*, 14 Colo. 90, 23 Pac. 908; *Morrow vs. Mathew*, 10 Ida. 423, 79 Pac. 196. When a suit is brought within the time limited by the statute of limitations the burden is upon the defendant to show, by demurrer or answer, that unusual conditions or extraordinary circumstances exist which require the application of the doctrine of laches. When suit is brought after the statutory time has elapsed, the burden is upon the plaintiff to show by suitable allegations in the complaint that it would be inequitable to apply it to his case. *Stevens vs. Grand Central Co.*, 133 Fed. 28; *Steinbach vs. Bon Homme Co.*, 152 Fed. 333; *Morse vs. Smythe*, 255 Fed. 981, 46 Colo. 199, 102 Pac. 1072.

⁹⁵ *Wagner vs. Baird*, 7 How. 234; *Lansdale vs. Smith*, 106 U. S. 391; *Westerman vs. Dinsmore*, 68 W. Va. 591, 71 S. E. 250. While the law imposes the requirement of reasonable promptness in all cases to avoid laches, it requires greater diligence and activity in seeking to rescind transactions with reference to oil values affected by extraordinary uncertainty and fluctuations as they are, than with reference to ordinary dealings. *Minchew vs. Morris*. — *Tex. C. A.* —, 241 S. W. 215. For instances of excusable delay, see *Mexico-Wyoming Co. vs. Valentine*, 237 Fed. 150; *Stone vs. Marshall Co.*, 188 Pa. St. 602, 41 Atl. 748, 1119.

⁹⁶ *O'Brien vs. Wheelock*, 184 U. S. 482; *Stevens vs. Grand Central Co.*, *supra* (44); *Mexico-Wyoming Co.*, *supra* (49); *Minnesota Co. vs. McGirr*, 263 Fed. 482.

Because of his failure to prosecute the suit, the consequences are the same as if no suit had been begun.⁹⁷ In other words, a party is as much open to the charge of laches for the failure to prosecute a suit diligently as if he had unduly delayed its institution.⁹⁸

§ 64. Injunction.

An injunction to prevent an alleged trespasser from drilling oil wells and appropriating and removing oil from the premises in controversy in effect permits the complainant to drill for, remove and market the oil from the land in dispute. If the complainant has no legal title to the land as claimed by the defendant and the defendant has in fact a duly approved oil lease from the rightful owner, the injunction might work an injustice to such lessee and the owner, but for the fact that the courts have ample authority to safeguard their interest if in a proper proceeding a probability of recovery is shown.⁹⁹

§ 65. Removal of Machinery and Fixtures.

The parties to an oil and gas lease may by their contract stipulate what machinery and fixtures may be removed upon the termination of the lease. Such a stipulation is controlling.¹⁰⁰

§ 66. Sale Under Foreclosure Proceedings.

An oil and gas lease executed subsequent to a mortgage will terminate upon the foreclosure of the mortgage, and a sale of the premises under the decree of foreclosure.¹⁰¹

§ 67. Deeds.

Independent estates may be carved out of the same land as where the owner of the surface grants only the right to the underlying minerals.¹⁰²

⁹⁷ Northrup vs. Browne, 204 Fed. 122; U. S. vs. Fletcher, 231 Fed. 326; Taylor vs. Salt Creek Co., *supra* (60); Grand Lodge vs. Graham, 96 Iowa 615, 65 N. W. 842; see, also, Mackall vs. Casilear, 137 U. S. 556; Willard vs. Wood, 164 U. S. 525; O'Brien vs. Wheelock, *supra* (60).

⁹⁸ U. S. vs. Fletcher, 242 Fed. 518. Where the defendant has not been prejudiced and there is a reasonable excuse for the delay, the suit is not barred. Central Co. vs. Jersey City, 199 Fed. 245; see Porto Rico Co. vs. Conklin, 271 Fed. 570. Where a party interposing a defense of laches has contributed to or caused the delay, he can not take advantage of it. N. P. R. Co. vs. Boyd, 177 Fed. 804.

⁹⁹ Collier vs. Bartlett. — Okla. —, 175 Pac. 247; see Washburn vs. Gillespie, 261 Fed. 41; Advance Oil Co. vs. Hunt, *supra* (6). A preliminary injunction should only be granted where injury to the property of plaintiff is imminent and, if committed, irreparable. And it generally will not be awarded where the plaintiff's right is not clear or, to turn the proposition around, where the wrong is not manifest. Courts of equity invariably, on a hearing for preliminary injunction, endeavor so far as possible to make such decree, however it may be framed, as will maintain the *status quo* until final hearing or judgment. Hicks vs. American Co., 207 Pa. St. 570, 57 Atl. 55; see, also, Pellissier vs. Whittier Co., 59 Cal. A. 1, 209 Pac. 593. The unlawful extraction of petroleum oil or gas from land, they being a part of the land, is an act of irreparable injury. Bettman vs. Harness, 42 W. Va. 433, 26 S. E. 271; Moore vs. Jennings, 47 W. Va. 181, 34 S. E. 793; see, also, U. S. vs. Dominion Oil Co., 241 Fed. 426.

¹⁰⁰ In re American Fork Co., 291 Fed. 746; see, also, Collins vs. Mt. Pleasant Co., 85 Kan. 483, 118 Pac. 54; see Wisconsin-Texas Co. vs. Clutter, *supra* (60) for a case in which no right was given to remove casing from the well.

¹⁰¹ Mercantile Trust Co. vs. Sunset Road Co., 176 Cal. 461, 195 Pac. 466.

¹⁰² Catron vs. South Butte Co., 181 Fed. 941; Stinchfield vs. Gillis, 96 Cal. 33, 30 Pac. 839; Smith vs. Jones, 21 Utah 270, 60 Pac. 1104; see note 106, *infra*. For rights of owner of surface as against owner of minerals thereunder, see West Pratt Co. vs. Dorman, and monographic note, 135 Am. St. Repts. 127. See, also, Vance vs. Clark, 252 Fed. 498; Midkiff vs. Colton, 252 Fed. 424. The carving out of a separate estate in the oil and gas in land is a common occurrence in oil- and gas-producing fields. A reservation or exception of the minerals in a tract of land is a separation of the estate in the minerals from the lease of the surface, and it makes no difference whether the word used is "excepted" or "reserved." DeMoss vs. Sample, *supra* (1); Mandle vs. Gharing, 256 Pa. St. 121, 100 Atl. 535.

§ 68. Construction of Deed.

A deed must be determined by the laws of the state in which the lands it conveys are situate, irrespective of where it may have been executed, or the grantors reside.¹⁰³

§ 69. Abstract of Title.

A contract for the purchase of an oil and gas lease required the lessor to submit to a certain named attorney a complete abstract of title to the land and that the lease should take effect and the obligations of the parties accrue "only in case such attorney should approve the title to the land." The contract provided that the lessee should deposit in a bank fifteen hundred dollars as earnest money and on the failure of the lessee to comply with the contract in beginning work, as agreed, the money should be paid to the lessor as liquidated damages. Upon the submission of the abstract of the title the attorney disapproved of the title. The reasonable conclusion from the language of the contract is that in the event of the approval of the abstract the contract should be effectual and binding but in the event of the disapproval of the title should not take effect. The mutual obligations of the parties should accrue only in case of the approval of the title. A bank was not authorized to pay the deposit to the lessor after the disapproval of the title and the lessee was entitled to recover from the bank and the lessor. In an action by the lessor to enforce the sale after the title has been rejected by the attorney, the burden was upon the lessor to prove that the lessee or the attorney acted in bad faith in rejecting the title.¹⁰⁴

§ 70. Income.

In legal effect the bonus, rentals, and royalty accruing under oil and gas leases are income from mineral resources. The Supreme Court of the United States has held that the bonus or down payment received by landowners at the time of making a lease is to be treated as a royalty, for the reason that it is income from the use of the mineral resources of the land.¹⁰⁵

§ 71. Taxation.

Mining rights and privileges under an oil lease are subject to taxation

¹⁰³ *Plattner vs. Vincent*, 187 Cal. 451, 202 Pac. 216; see, also, *Rose's notes to McGoon vs. Scales*, 76 U. S. 23. For construction of deed and agreement to develop mining property, see *White vs. Hendley*, 185 Cal. 614, 193 Pac. 22, 169 Pac. 710. For an elaborate discussion of the effect of a deed reserving a part of the royalty of all gas or oil or the proceeds therefrom, which may be produced from the deeded premises, see *Dunlap vs. Jackson*, *supra* (88); see, also, *Dill vs. Rockwell*, — Okla. —, 220 Pac. 620. It may be stated as a general proposition that if the deed or written instrument furnishes other sufficient means of identifying the property conveyed, the failure to state the town, county or state where the same is situate will not make the deed or instrument void nor inoperative. *Miller vs. Hodges*, — Tex. C. A. —, 260 S. W. 170. Where there is uncertainty in specific description, the quantity named may be of decisive weight. *Ainsa vs. U. S.*, 161 U. S. 220; *Producers Co. vs. Hanzen*, 238 U. S. 338. If the property has a known descriptive name, it may be sufficiently described by such name. *Glacier vs. Willis*, 127 U. S. 471; *Reed vs. Munn*, 148 Fed. 737; *Carter vs. Bacigalupi*, 83 Cal. 187, 23 Pac. 361; *Berquist vs. W. Virginia Co.*, 18 Wyo. 234, 106 Pac. 673. That a property is known by several names and only one of them is given is immaterial. *Lebanon Co. vs. Con. Republican Co.*, 6 Colo. 371; *Collins vs. McKay*, 36 Mont. 123, 92 Pac. 295; see *Shoshone Co. vs. Rutter*, 87 Fed. 301.

¹⁰⁴ *First Nat. Bank vs. Clay*, — Okla. —, 177 Pac. 115; see, also, *Merrill vs. Rocky Mt. Co.*, 26 Wyo. 219, 181 Pac. 972; *St. Louis Co. vs. Nity*, — Okla. —, 224 Pac. 982.
¹⁰⁵ *Wright vs. Carter Oil Co.*, — Okla. —, 223 Pac. 835; and see *Von Baumbach vs. Sargent Co.*, *supra* (3); *U. S. vs. Biwabik Co.*, 247 U. S. 124; *Work vs. U. S.*, 261 U. S. 352.

from and in addition to the interest or estate of the lessor,¹⁰⁶ whether the title be in the United States or in the state.¹⁰⁷

§ 72. Insurance.

An insurance policy covering oil in tanks provided that the company should not be liable beyond the actual cash value of the property at the time of the loss and the loss shall be ascertained according to such actual cash value, with proper deductions for depreciation. On the loss of the oil insured the actual cash value was to be the measure of damages, but it could not exceed what it would cost the insured to replace it. The cash value of an article is the amount of cash for which it will exchange in fact; and the cash value is the market value for which an article will sell for in cash on the market. Where a state had a state corporation which fixed the price of oil and no one had a legal right to sell oil in the state for less than the price so established, this is sufficient to establish the cash value of the oil, especially in the absence of countervailing evidence.¹⁰⁸

§ 73. State Inspection Laws.

A state may pass proper inspection laws for oils brought into its borders in interstate commerce. But a state may not impose burdens upon interstate commerce in the matter of oil inspection.¹⁰⁹

§ 74. Pipe Lines.

A pipe line company is a common carrier,¹¹⁰ may exercise the right of eminent domain,¹¹¹ is subject to control, and its rates to regulation, by the state.¹¹²

¹⁰⁶ Each of separate layers of strata becomes a subject of taxation, levy and sale, precisely like the surface. *Murray vs. Allred*, 100 Tenn. 100, 43 S. W. 355; see, also, *McGraw vs. Lakin*, 67 W. Va., 385, 68 S. E. 27; *Appeal of Colby*, 184 Iowa 1104, 169 N. W. 443. There may be several estates in the same land owned by different persons, one owning the surface, another the timber, and a third the minerals underground, each being a separate estate and each may be separately taxed. *N. P. R. Co. vs. Mjelde*, 48 Mont. 287, 137 Pac. 386; *Cobban Co. vs. Donlan*, 51 Mont. 53, 149 Pac. 487; see, also, *Stephens Co. vs. Mid-Kansas Co.*, — Tex. —, 254 S. W. 290; but see *Indian Co.*, — Okla. —, 142 Pac. 997.

¹⁰⁷ *Graciosa Oil Co. vs. Santa Barbara Co.*, 155 Cal. 140, 99 Pac. 483; see *Barnes vs. Bee*, 138 Fed. 476; *Con. Coal Co. vs. Baker*, 135 Ill. 545, 26 N. E. 651. A sale for taxes while the title still is in the United States is void, the land not being subject to taxation by the state. *Secret Valley Co. vs. Perry*, 187 Cal. 423, 202 Pac. 449. While unpatented, mining claim is not subject to taxation. *Doyle vs. Austin*, 47 Cal. 353. The possessory right thereto and the product from the location may be taxed and the lien enforced by a sale of the right of possession. The right of possession means the claim itself, that is, the right of possession of the land for mining purposes. The tax deed conveys merely such right without affecting the interest of the United States. *Elder vs. Wood*, 208 U. S. 226. An oil and gas lease by which the lessee is granted the privilege of drilling for and producing oil, if it can be found on the premises, is property and is regarded as a thing of value and is subject to taxation. *Raydure vs. Board*, 183 Ky. 84, 209 S. W. 19; see, generally, *Large Oil Co. vs. Howard*, 63 Okla. 143, 163 Pac. 537.

¹⁰⁸ *Globe & Rutgers vs. Prairie Oil & Gas Co.*, 248 Fed. 458.

¹⁰⁹ *Standard Oil Co. vs. Graves*, 249 U. S. 389; see *Pure Oil Co. vs. Minnesota*, 248 U. S. 158; *Bartels-Northern Oil Co. vs. Kackman*, 29 N. Dak. 236, 150 N. W. 576; *Castle vs. Mason*, 91 Ohio St. 296, 110 N. E. 463. For a review of state inspection laws, see *Red "C" Co. vs. Board*, 222 U. S. 380.

¹¹⁰ *Prairie Co. vs. U. S.*, 204 Fed. 798. That a pipe line company may be a common carrier though it transports oil only for a corporation owning its capital stock, see *Meischke-Smith vs. Wardell*, 286 Fed. 785; see *The Pipe Line Cases*, 234 U. S. 562; and see *Producers Co. vs. R. R. Comm.*, 251 U. S. 228, affirming 176 Cal. 499, 169 Pac. 59.

¹¹¹ *Producers Co. vs. R. R. Comm.*, *supra* (110); *Consumers Co. vs. Harless*, 131 Ind. 446, 129 N. E. 1062.

¹¹² *Producers Co. vs. R. R. Comm.*, *supra* (110).

§ 75. Interstate Commerce.

The transportation of oil or gas from state to state through the medium of pipe lines is interstate commerce.¹¹³ It is not the usual practice of railway companies to furnish tank cars for shippers of oil.¹¹⁴

¹¹³ Public Utilities Comm. vs. Landon, 249 U. S. 245; see West vs. Kansas Co., 221 U. S. 229. The question whether particular commerce is interstate or intrastate is ordinarily determined by what is actually done and not by any mere billing or plurality of carriers. Where cars or tanks are in fact destined from one state to another, rebilling or reshipping en route does not of itself break the continuity of the movement nor require that any part be classified differently from the remainder. It is the essential character of the commerce, not the extent of local or other bill of lading. Western Oil Co. vs. Lipscomb, 244 U. S. 349; see, also, Landon vs. Public Utilities Comm., 242 Fed. 683; and see State vs. Landon, 100 Kan. 593, 165 Pac. 1112.

¹¹⁴ Chicago Co. vs. Lawton Co., 253 Fed. 708; compare Illinois Co. vs. Mulberry Co., 238 U. S. 232; see Penn. Co. vs. Puritan Co., 237 U. S. 127.

APPENDIX—FORMS.

Form No. 1.

(The subjoined is an approved form of an oil and gas lease. It is commonly called the 'Texas Lease'.)

OIL AND GAS LEASE.

AGREEMENT, made and entered into the _____ day of _____ 19__, by and between _____ of _____ County of _____, State of _____, part _____ of the first part hereinafter called lessor (whether one or more) and _____, party of the second part hereinafter called lessee.

WITNESSETH, That the said lessor, for and in consideration of _____ DOLLARS cash in hand paid, receipt of which is hereby acknowledged, and of the covenants and agreements hereinafter contained on the part of lessee to be paid, kept and performed, ha____ granted, conveyed, demised, leased and let, and by these presents do____ grant, convey, demise, lease and let exclusively unto the said lessee, for the sole and only purpose of mining and operating for oil and gas, and of laying pipe lines, and of building tanks, power-stations and structures thereon to produce, save and take care of said products, all that certain tract of land situated in the County of _____, State of _____, Section _____, Township _____, _____ Range, _____, _____ M., and containing _____ acres, more or less.

It is agreed that this lease shall remain in force for a term of _____ years from this date, and as long thereafter as oil or gas, or either of them, is produced from said land by the lessee.

In consideration of the premises the said lessee covenants and agrees:

1st. To deliver to the credit of lessor, free of cost, in the tanks or pipe lines to which he may connect his wells, the equal _____ part of all oil produced and saved from the leased premises.

2d. To pay the lessor _____ DOLLARS each year in advance, for the gas from each well where gas only is found, while the same is being used off the premises, and lessor to have gas free of cost from any such well for all stoves and all inside lights in the

principal dwelling house on said land during the same time by making his own connection with the well at his own risk and expense.

3d. To pay lessor for gas produced from any oil well and used off the premises at the rate of _____ DOLLARS per year, for the time during which such gas shall be used, said payments to be made each three months in advance.

If no well be commenced on said land on or before the _____ day of _____, 19____, this lease shall terminate as to both parties, unless the lessee on or before that date shall pay or tender to the lessor, or to the lessor's credit in the _____ Bank at _____, or its successors, which shall continue as the depository regardless of changes in the ownership of said land, the sum of _____ DOLLARS, which shall operate as a rental and cover the privilege of deferring the commencement of a well for _____ months from said date. In like manner and upon like payments or tenders the commencement of a well may be further deferred for like period of the same number of months successively. And it is understood and agreed that the consideration first recited herein, the down payment covers not only the privileges granted to the date when said first rental is payable as aforesaid, but also the lessee's option of extending that period as aforesaid, and any and all other rights conferred.

Should the first well drilled on the above described land be a dry hole, then, and in that event, if a second well is not commenced on said land within twelve months from the expiration of the last rental period for which rental has been paid, this lease shall terminate as to both parties, unless the lessee on or before the expiration of said twelve months shall resume the payment of rentals in the same amount and in the same manner as hereinbefore provided. And it is agreed that upon the resumption of the payment of rentals, as above provided, that the last preceding paragraph hereof, governing the payment of rentals and the effect thereof, shall continue in force just as though there had been no interruption in the rental payments.

If said lessor owns a less interest in the above described land than the entire and undivided fee simple estate therein, the royalties and rentals herein provided shall be paid the lessor only in the proportion which _____ interest bears to the whole and undivided fee.

Lessee shall have the right to use, free of cost, gas, oil and water produced on said land for his operations thereon except water from wells of lessor.

When requested by lessor, lessee shall bury his pipe lines below plow depth. No well shall be drilled nearer than 200 feet to the house or barn now on said premises. Lessee shall pay for damages caused by his operations to growing crops on said land. Lessee shall have the right at any time to remove all machinery and fixtures placed on said premises, including the right to draw and remove casing.

If the estate of either party hereto is assigned—and the privilege of assigning in whole or in part is expressly allowed—the covenants hereof shall extend to the assigns and successive assigns, but no change in the ownership of the land or assignment of rentals or royalties shall be binding on the lessee until after the lessee has been furnished a written transfer or assignment or a true copy thereof; and it is hereby agreed that in the event this lease shall be assigned as to a part or as to parts

of the above described lands and the assignee or assignees of such part or parts shall fail or make default in the payment of the proportionate part of the rents due from him or them, such default shall not operate to defeat or affect this lease in so far as it covers a part or parts of said lands upon which the said lessee or any assignee thereof shall make due payment of said rental.

Lessor hereby warrants and agrees to defend the title to the lands herein described, and agrees that the lessee shall have the right at any time to redeem for lessor, by payment, and mortgages, taxes or other liens on the above described lands, in the event of default of payment by lessor, and be subrogated to the rights of the holder thereof.

In TESTIMONY WHEREOF, We, in duplicate, sign, this the
----- day of -----, 19-----.

Witness: -----

For another form of lease see Washburn vs. Gillespie, 261 Fed. 42.

Form No. 2.

ASSIGNMENT OF LEASE.

(Precedent in Ratcliff vs. Paul, — Kan. —, 220 Pac. 279.)

Know all men by these presents: That-----, on this----- day of-----, for and in consideration of one dollar and other considerations, the receipt whereof is hereby acknowledged, do hereby assign, sell, transfer and set over unto----- all----- right, title, and interest, in and to an oil and gas mining lease, the land assigned being described to wit: (Description) (Record reference to lease). That ----- are the lawful owner-- and holder-- of said oil and gas mining lease, and the same is free from all incumbrances and that----- have good right and title to sell and assign the same. Witness ----- hand-- the day and year first above written.

I, -----, wife of the said-----, for the considerations aforesaid, do hereby join in this assignment and hereby release and relinquish all my rights of dower and homestead in and to the lease and rights above assigned and transferred.

Form No. 3.

EXTENSION OF LEASE.

(Precedent in Pellissier vs. Pan-American Co., 41 Cal. A. D. 415, 217 Pac. 570.)

The lessor-- hereby agree-- that in lieu of commencing and prosecuting operations, for the drilling of a well upon said land described in and leased by said indenture of lease, the lessee-- may, if----- shall so elect, pay to the lessor-- on the----- day of each and every calendar month, for an additional period of----- months, commencing on the ----- day of-----, as and for rental for said land the

sum of-----dollars per month, and such payments so made from month to month, shall relieve the lessee-- of and from all obligations to commence or prosecute any drilling or other operations upon said land during such month. In witness whereof the said lessor-- ha-- hereunto set-----hand-- the-----day of-----State of-----,

Form No. 4.

CONJOINT DEED AND LEASE.

(Precedent in Wright vs. Carter Oil Co., — Okla. —, 223 Pac. 835.)

State of-----, County of----- ss.

Know all men by these presents: That-----and-----, parties of the first part, in consideration of the sum of-----dollars, in hand paid, the receipt of which is hereby acknowledged, do hereby grant, bargain, sell and convey unto-----, the party of the second part, an undivided-----interest in and to all of the mineral rights, including oil, natural gas and petroleum in----- (description) in-----County, State of-----, with the right and privilege to the grantors and grantee, or either of them, to go on said land and explore, operate, drill and mine for oil and gas, and other minerals, and to sell the products thereof and divide the same or the proceeds thereof as their interests appear and as provided herein. It is expressly understood, however, that this grant is subject to a certain oil and gas lease now on said premises, dated-----, made and executed by the grantors to the-----Company.

Signed and delivered this the-----day of-----.

Witnesses:

Form No. 5.

*OIL WELL DRILLING CONTRACT.

(Precedent in Cook vs. Columbian Co., 144 Cal. 670, 78 Pac. 287.)

This agreement, made and entered into this ----- day of -----, 19--, between -----, of -----, the party of the first part, and -----, of -----, the party of the second part, Witnesseth:

That the party of the second part will furnish at his own cost and expense all the machinery, tools, paraphernalia and materials of all kinds, including labor, fuel, water, and any and all things of whatsoever kind and nature that may be necessary and needful (except casing, pipe and shoes) to properly perform the work of drilling or boring not less than ----- feet of hole or wells, and to drill or bore the same at any one or more places on the following described land situate, lying and being in the County of -----, State of -----, and more particularly described as follows, to wit:

*NOTE.—Under the provisions of an act to prevent injury to oil, gas or petroleum-bearing strata or formations by the penetration or infiltration of water therein, it is provided in California that any well drilled and abandoned in violation of the terms of the statute is a public nuisance and may be abated by appropriate action of the board of supervisors of the county. The expenses so incurred are a charge against the owner of the well and a lien upon the well. Interference with official action is a misdemeanor. Cal. Stats. 1909, p. 586; see, also, Stats. 1921, Chap. 912, Sec. 16.

For capping of wells to prevent wasteful escape of natural gas into the atmosphere see Stats. 1911, p. 499.

(Description)

and may be desired and designated by the party of the first part, for the agreed price per foot sunk, as shown and set forth in the following scale of prices, at different depths up to ----- feet, and in accordance with the further terms and conditions herein contained. Provided, however, that in case the drilling of any well shall be stopped by the party of the first part for any cause after it has been begun, that the party of the first part will pay the net cost of moving the drilling outfit to any other place on the said property where another well is to be started, in addition to the amount earned for the number of feet sunk in accordance with the said scale of prices per foot and that should work be stopped on any well for any cause, after a depth of ----- feet has been sunk, then the said party of the second part shall move the rig at his own cost and expense to the place designated by the party of the first part. That in case of abandonment of any well or wells for any cause the party of the second part will pull and remove, in a careful manner, all casing, pipe and fittings used in said well or wells that can be got out by a reasonable and faithful effort by the use of all appliances and tools ordinarily used in performing such work.

That all casing, pipe and shoes of the proper sizes necessary to be used in the well or wells will be furnished and delivered on the ground by the party of the first part and shall be of such sizes as such party may select, and the same shall be properly inserted and used in the wells by the party of the second part and carried to the bottom, if possible, without diminishing the size except in cases where it is found absolutely unavailable after the use of under-reamers and other appliances, as may be necessary and proper for keeping the whole in proper shape.

That in case a body of asphaltum be encountered at any considerable depth and it is found impossible after a faithful and reasonable effort so to do that it can not be drilled through nor penetrated by the use of any of the known tools and appliances, then the said well will be considered as completed and a settlement made in full for the depth drilled according to the said scale of prices; provided, however, that the party of the first part shall have full and free right and privilege to use and operate the machinery and outfit of the party of the second part at his own cost and expense for a period not to exceed -----, or until satisfied that the hole can not be sunk any deeper.

That in case oil, gas or asphaltum shall be found at any depth in any well and the party of the first part shall elect to stop drilling in such well, the party of the second part shall properly test the well and leave the same in condition ready for the pump or other working appliance before moving the rig and outfit away.

It is understood by and between both parties hereto that this contract is for a total of ----- feet of hole or wells, and that the party of the second part agrees to put down any one hole to a total depth of ----- feet, if the ground is such that it can possibly be done, by reasonable effort, or that he will stop the drilling of any well at any depth, as directed by the party of the first part and in accordance with the said scale of prices per foot sunk, and the terms and conditions herein contained.

That the party of the first part will pay, or cause to be paid, to the party of the second part the amount earned for each foot of hole sunk in accordance with the said scale of prices at times and as follows, to wit:

. An advance sum of ----- dollars, when the rig and outfit are on the ground and ready to commence the work of drilling; ----- per cent of the amount earned as per scale when the well has been sunk to a depth of ----- feet and a like ----- per cent of the amount earned at the completion of each ----- feet until the well is either completed or abandoned, or the work stopped by the party of the first part, when the balance in full shall be paid, after deducting the said advance payment of ----- dollars.

Done in duplicate, the day and year first above written.

NOTE.—Federal and state leases on oil and other mineral lands will be covered in a future issue of 'Mining in California.'—Editor.

NOTE ON ANDALUSITE FROM CALIFORNIA.

A NEW USE AND SOME THERMAL PROPERTIES.*

By ALBERT B. PECK.¹

The andalusite described here is found at an elevation of 10,000 feet on the southwestern slope of White Mountain in the White Mountains of the Inyo Range, Mono County, California. The deposit itself is located across a canyon about two miles east and north of an occurrence described by Knopf.² The andalusite reported by Knopf, however, is at present of no commercial value owing to the fact that it carries too large amounts of quartz.

MINERALOGY.

Occurrence and Physical Properties.

The main mass of the andalusite rock can probably best be described as coarse granular, and it is generally of a gray or light pinkish brown color. On exposed surfaces the color is yellow brown due to oxidation.

The texture of the rock varies greatly. Many large fragments show a very distinctly coarse radial or columnar structure, definite rough crystals four or five inches in length being noted. At the other extreme are smaller areas which have a very fine granular texture, sugary in appearance and very friable, breaking down readily into a fine sand. While the material is generally quite compact there are occasional large cavities in the mass, and in these are sometimes found excellent groups of large coarse crystals at times reaching five inches or more in length.

The color of the material shows variation also. Crystals are generally white on the exterior but when broken show directly beneath the surface a pale apple green color. Columnar or radial masses also show green or gray color but granular masses are usually white, gray, or pinkish brown. This latter color is in reality due to inclusions of scattered rutile grains or crystals, as can readily be observed when examined microscopically.

Crystallography.

The crystals appearing in cavities are generally rather simple in form but of uncommon habit for andalusite. This probably accounts for the fact that of all those to whom a group has been shown, no one has as yet named the crystals as andalusite. The crystals are usually covered with a thin white coating which is dull and somewhat rough, so that accurate measurements of the crystal angles are impossible. Contact goniometer measurements, however, show sufficiently close relation to the theoretical values to establish the forms present. The crystals usually occur in more or less parallel groups terminated at one end only and are also attached to each other by the prism faces so that the prism zone is generally only partly complete.

*Read before the annual meeting of the Mineralogical Society of America at Washington, D. C., December, 1923. To appear in the *American Mineralogist*, June 1924.

¹ Mineralogical Laboratory, University of Michigan.

² *Journal Wash. Acad. Sc.*, 7, 549 (1917).

Figure 1 shows the form of a typical crystal. The predominant prism is $k(210)$ and the end of the form is terminated by the dome $r(101)$. Measurements of the angles are as follows:

| | Observed | Calculated | |
|---------|-------------------------|--------------|-------|
| kk''' | $62^{\circ}-51^{\circ}$ | 52° | $30'$ |
| rr' | 72 | 70 | 56 |

The prism faces on the larger crystals are somewhat rounded, hence the variation in the angles noted for this form. Faces of the smaller

FIG. 1

crystals, however, give values close to those calculated for the form. Owing to the fact that the ratio of $a:b$ in andalusite is nearly 1:1, the angles for the forms (210) and (120) are very similar. It was necessary therefore in this case to make a thin section parallel to the base and determine the position of the optic plane. This was found to be in the short diagonal and being parallel to the a -axis, the prism then is established as $k(210)$. It follows that the dome is $r(101)$ and not $s(011)$, these two forms also being very similar in their angles.

Chemical Composition.

On the whole the rock material is a rather pure andalusite with comparatively small amounts of several other minerals. During mining, the material is constantly checked by specific gravity determinations on

a Jolly balance. Samples are taken over the face of the working and if favorable, the material is broken out, carefully hand selected, and sacked. Generally it runs at least 75-85 per cent andalusite upon microscopic examination. A typical chemical analysis from a sample representing a carload shipment recalculated to an Al_2SiO_5 basis will show over 90 per cent Al_2SiO_5 . Such an analysis follows:

| | | | |
|-------------------------|--------|---------------------------|--------|
| SiO_2 | 33.78% | Equivalent to | |
| Al_2O_3 | 56.89 | Al_2SiO_5 | 94.18% |
| H_2O | 0.37 | SiO_2 | 0.22 |
| Ign. loss | 3.67 | Others | 5.60 |
| other deter. | | | |
| constituents | 5.37 | 100.08 | |

The fact that the chemical analysis generally shows higher Al_2SiO_5 than is indicated by the microscopic examination is due to the very general presence of corundum in the material. In no case do the associated minerals assume any large proportion over any considerable area although locally they may occasionally outweigh the andalusite.

Associates.

The associates of the andalusite are also deserving of mention, especially because several are counted among the less common minerals.

Lazulite is perhaps the most unusual mineral associated with the andalusite. It occurs in small blue-green veinlets or masses scattered through the mass. Optically it shows a distinct light blue pleochroism. Chemical analysis usually shows small amounts of P_2O_5 present in the rock.

Pyrophyllite is another uncommon mineral found with the andalusite. It occurs in crusts of radial fibers on the walls of cracks or as radial masses in small cavities. Owing to its chemical composition, as soon as its water is lost it takes on nearly the same composition as andalusite and hence can hardly be considered as an impurity.

Muscovite also occurs in much the same manner as pyrophyllite and is somewhat more abundant but at no time reaches large proportions. It occurs in distinct plates, usually in divergent groups.

Corundum is a rather common associate of the granular andalusite and is usually deep sapphire blue in color. It is generally in small scattered plates or grains but occasionally may form lenses two or three inches in size. According to observation thus far it is always blue in color. In a few instances crystals of andalusite with blue corundum centers have been noted. For manufacturing purposes a small amount of corundum is favorable to the neutralization of the effect of any excess quartz in the rock.

Rutile is a rather constant associate, largely as microscopic inclusions in the andalusite. At times small free crystals can be found. The constant association of rutile and the blue color of the corundum would seem to confirm the theory that the color of sapphire is due to the presence of TiO_2 .

Pyrite is sometimes found locally, especially near open veins. When near the surface it has often weathered leaving a stained and porous rock.

The absence of quartz is very noticeable. It is almost never found in the andalusite proper but is confined to veins crossing the mass.

Barite also has been noted a few times, one large right angled twin having been found.

Lazurite also has been found, not in the andalusite but in veins of milky quartz adjacent to the mass. It is of interest to note that Knopf points out that the occurrence examined by him across the canyon and to the southwest was first staked as a silver mine, the bright blue lazurite being thought to be AgBr. After assay showed no silver the claim was dropped. Later the brown andalusite mass was staked again, this time under the impression that it was apatite. This in turn proved valueless and was relinquished.

USE.

This deposit of andalusite serves as an extremely good example of a comparatively useless, rare, or 'museum' mineral first becoming common enough to be available on a commercial scale, because it has heretofore been observed only in small scattered masses or crystals, and second, at the same time finding a commercial use, until at present about 70 tons per week are being mined. Both of these have been the result of patience and thorough scientific research.

For some years the manufacture of the porcelain core of the most modern type of automobile spark plug has tended toward the formation during the burning process of an increasingly higher content of a crystalline compound, thought to be an 'artificial sillimanite.' Bowen¹ has recently shown, however, that in artificial melts of Al_2O_3 and SiO_2 in varying proportions the compound $\text{Al}_2\text{O}_3\cdot\text{SiO}_2$ corresponding to natural sillimanite does not form as has been stated in the earlier work on the subject but that the compound formed has a composition $3\text{Al}_2\text{O}_3\cdot 2\text{SiO}_2$. Not only is this compound similar chemically to sillimanite but its physical and optical properties are remarkably similar as well.²

This 'artificial sillimanite' produced in ceramic ware results from the molecular changes taking place in clay under the influence of heat and various fluxes. The highest content of 'sillimanite' has been accomplished by introducing into the unburned body artificially prepared 'sillimanite' in the form of a calcine—a mixture of clay, alumina, and fluxes, heated to a high temperature of about 1500°C . This was of course an expensive method to obtain the desired end although it has been used for several years in the manufacture of spark plugs.

In order to eliminate the necessity of making an 'artificial sillimanite', the natural way out was to turn to one of the natural Al_2SiO_5 compounds, namely, sillimanite, andalusite, or cyanite, but here the difficulty of obtaining any of these in sufficiently large quantities and in a pure state presented itself until the California andalusite deposit was located.

¹ N. L. Bowen and J. W. Greig, J. Am. Cer. Soc., 7, 238-54 (1924).

² In the original manuscript of the present paper the writer regarded the crystalline compound formed by the inversion of andalusite and cyanite and the crystals formed in porcelain as sillimanite, following the earlier work of the Geophysical Laboratory on the system $\text{Al}_2\text{O}_3\cdot\text{SiO}_2$. Since the announcement of the work of Bowen and Greig it has been necessary in several cases to change 'sillimanite' to the new compound $3\text{Al}_2\text{O}_3\cdot 2\text{SiO}_2$. This statement is made so that full credit may be given to them for the facts they have discovered and the writer's sincere thanks are due Dr. Bowen for his kindness in allowing this use of his manuscript before its actual publication.

Careful research was then able to substitute this natural material for the 'artificial sillimanite' with the result that not only was the manufacture less expensive but also that resulting article was better than the previous one.

Thermal Changes.

Although the material is introduced into the clay body of the unburned porcelain core as andalusite, certain changes take place during the burning process and as a result of these there is present no andalusite in the finished article but all of the andalusite undergoes a molecular change to a compound of the composition $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ with excess of a glass highly siliceous in composition.

This change is quite definite, taking place sharply and at a definite temperature. Under manufacturing conditions this temperature is in the neighborhood of cone 13 on the Seger scale (theoretically equal to 1390°C but actually probably considerably lower).³

Of interest from the microscopic standpoint is the behavior of andalusite during this change. Up to the inversion point andalusite retains all of its original optical properties except for the formation of small glass-like inclusions which apparently represent the fusion of included impurities. At the inversion point the clear homogeneous grains of andalusite give way to grains composed of fibrous or columnar crystals, each crystal parallel to the adjacent one with a narrow strip of glass between. The result is instead of a clear grain, a grain composed of a group of parallel crystals having all of the optical properties of $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$, with glass between each. Traces of the remains of such structures can sometimes be seen in a section of a finished spark plug core.

Cyanite also changes to $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ and glass under heat but at a lower temperature of about cone 11 (theoretically 1350°C). The structure developed is also different from that shown by the change in andalusite. Cyanite yields a body consisting of groups of interlocking fibers of $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ which are not parallel over any considerable length. Along with these are areas of glassy matter, generally more abundant than in the andalusite and due no doubt to the fact that cyanite is less pure as a rule than andalusite. Cyanite has higher specific gravity therefore more substance per unit volume, which when breaking up would yield more matter from each previous unit but should this change the relative amounts?

The fact that andalusite changes to $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ at a temperature considerably below the final temperature to which the porcelain is burned has a very practical value because in this change from andalusite to $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ and excess siliceous glass there is an increase in specific gravity and a consequent decrease in volume. This volume change tends to produce strains in the porcelain, which can be absorbed if the inversion takes place well below the final burning temperature. If this were not true and the change took place near the final temperature, the decidedly weaker porcelain might result.

Incidentally, during this inversion the andalusite does not outwardly break down and lose its original form, so that good artificial pseud-

³ The statements made here are purely provisional. Investigation of the changes with temperature is to be made in more detail at a later date.

omorphs of this mixture of $3\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ and glass after andalusite is readily obtained by simply heating for a sufficiently long period above the inversion temperature. This can not be done with cyanite because the expansion at the inversion point is so great that the cyanite breaks down into a chalky friable mass.

The writer here wishes to acknowledge his sincere thanks to Dr. J. A. Jeffery, president, and Mr. F. H. Riddle, research director of the Champion Porcelain Company, whose interest and cooperation have made this note possible.

NOTE.—The foregoing paper was received through the courtesy of Dr. Joseph A. Jeffery, president of the Champion Porcelain Company, and published by permission of Professor Peck. Dr. Jeffery adds, in his letter accompanying:

"It just occurred to me that you might be interested in knowing that the pyrophyllite possesses very valuable properties which aid us very greatly in the processing of the material through the plant. It is not only valuable in the wet-grinding process, but also greatly assists in maintaining a uniform moisture content during the working and pugging operations."—Editor.

ADMINISTRATIVE DIVISION.

WALTER W. BRADLEY, Deputy State Mineralogist.

Personnel.

The State Mining Bureau and particularly the Petroleum and Gas Department has been signally honored in the appointment of Mr. R. D. Bush, state oil and gas supervisor, by the President of the United States, to be a member of a commission of three to study and report on the Naval Oil Reserves and the leases thereon. The appointment will not require Mr. Bush to sever his connections with the State Mining Bureau.

New Publications.

During the period covered by this issue (January 15th to April 15th) the following Bureau publications have been made available for distribution:

Mining in California (quarterly), January 1924, being Chapter No. 1, of State Mineralogist's Report XX. Price 25 cents.

Summary of Operations, California Oil Fields: Vol. 9, Nos. 4, 5, 6 and 7, October, November, December, 1923, and January, 1924, respectively.

Commercial Mineral Notes: Nos. 10, 11, 12, January-March, inclusive.

These 'notes' carry the lists of 'mineral deposits wanted' and 'minerals for sale,' issued in the form of a mimeographed sheet, monthly. It is mailed free of charge to those on the mailing list for 'Mining in California.'

Owing to the very considerable increase in our mailing list for 'Mining in California,' which had grown beyond the ability of the present funds of the State Mining Bureau to pay the printing bills without additional revenue, it became necessary to place a subscription price on this quarterly of 25 cents per issue, or \$1 per year paid in advance.

Mail and Files.

The Bureau maintains, in addition to its correspondence file, a mine report file which includes reports on some 7500 mines and mineral properties in California. Also there is available to the public a file of the permits granted to mining and oil corporations by the State Commissioner of Corporations.

During the period of January 15-April 15, there were 2091 letters received and answered at the San Francisco office alone, covering a wide range of subjects concerning prospecting, mining and developing mineral products, reduction problems, and marketing of refined products.

DIVISION OF MINERALS AND STATISTICS.

Statistics, Museum, Laboratory.

WALTER W. BRADLEY, Deputy State Mineralogist.

STATISTICS.

California continues to produce commercially, as for a number of years past, at least fifty different mineral substances, the total annual value of which has averaged over \$250,000,000 the last four years. The estimated value for 1923, as shown in the January issue of 'Mining in California' (see page 50 *ante*), was \$270,472,000.

At the present writing (April 15), reports are in hand from most of the producers. Data for several substances are now complete and have been compiled, being presented herewith.

The data at hand indicate that there was no production in California in 1923 of the following substances, which have at one time or another in the past been on the active list here: Antimony, bismuth, cadmium, fluorspar, graphite, lithia, mica, molybdenum, serpentine, slate, strontium, and tin. In addition to the above, there are potential deposits of ores of the following which have not as yet yielded a commercial output: aluminum, arsenic, cobalt, nickel, nitrates, and vanadium.

BARYTES.

The output of crude barytes in California during 1923 amounted to a total of 2925 tons valued at \$16,058 f. o. b. rail-shipping point, as compared with 3370 tons valued at \$18,925 in 1922. The 1923 product came mainly from Nevada County, with smaller amounts from Mariposa and Shasta counties, and was consumed principally in the manufacture of lithopone. More than half of the total tonnage of barytes utilized in the United States is taken in the manufacture of lithopone, which is a chemically-prepared, white pigment containing approximately 70 per cent barium sulphate and 30 per cent zinc sulphide. This is one of the principal constituents of 'flat' wall paints.

Total Barytes Production of California.

The first recorded production of barytes in California, according to the statistical reports of the State Mining Bureau, was in 1910. The annual figures are as follows:

| Year | Tons | Value | Year | Tons | Value |
|------------|-------|---------|--------------|--------|-----------|
| 1910 ----- | 860 | \$5,640 | 1918 ----- | 100 | \$1,500 |
| 1911 ----- | 309 | 2,207 | 1919 ----- | 1,501 | 18,065 |
| 1912 ----- | 564 | 2,812 | 1920 ----- | 3,029 | 20,795 |
| 1913 ----- | 1,600 | 3,680 | 1921 ----- | 901 | 4,809 |
| 1914 ----- | 2,000 | 3,000 | 1922 ----- | 3,370 | 18,925 |
| 1915 ----- | 410 | 620 | 1923 ----- | 2,925 | 16,058 |
| 1916 ----- | 1,606 | 5,516 | | | |
| 1917 ----- | 4,420 | 25,633 | Totals ----- | 23,595 | \$129,260 |

BITUMINOUS ROCK.

Small amounts of bituminous rock are still occasionally used for road dressing in those districts adjacent to available deposits, though the

manufacture of asphalt at the oil refineries has almost eliminated the direct use of the native material. During 1923, a total of 2945 tons valued at \$11,780 was shipped from quarries in Santa Barbara and Santa Cruz counties, compared with 4624 tons and \$13,570 in 1922. This material is essentially an uncemented sandstone which is saturated with and held together by a natural asphaltic constituent probably the residue from the evaporation of a petroleum deposit.

Bituminous Rock Production of California, by Years.

The following tabulation shows the total amount and value of bituminous rock quarried and sold in California, from the records compiled by the State Mining Bureau, annually since 1887:

| Year | Tons | Value | Year | Tons | Value |
|------|--------|-----------|-------------|-----------|-------------|
| 1887 | 36,000 | \$160,000 | 1906 | 16,077 | \$45,204 |
| 1888 | 50,000 | 257,000 | 1907 | 24,122 | 72,835 |
| 1889 | 40,000 | 170,000 | 1908 | 30,718 | 109,818 |
| 1890 | 40,000 | 170,000 | 1909 | 34,123 | 116,436 |
| 1891 | 39,962 | 154,164 | 1910 | 87,547 | 165,711 |
| 1892 | 24,000 | 72,000 | 1911 | 75,125 | 117,279 |
| 1893 | 32,000 | 192,036 | 1912 | 44,073 | 87,467 |
| 1894 | 31,214 | 115,193 | 1913 | 37,541 | 78,479 |
| 1895 | 38,921 | 121,586 | 1914 | 66,119 | 166,618 |
| 1896 | 49,456 | 122,500 | 1915 | 17,789 | 61,468 |
| 1897 | 45,470 | 128,173 | 1916 | 19,449 | 66,561 |
| 1898 | 46,836 | 137,575 | 1917 | 5,590 | 18,580 |
| 1899 | 40,321 | 116,097 | 1918 | 2,561 | 9,067 |
| 1900 | 25,306 | 71,495 | 1919 | 4,614 | 18,537 |
| 1901 | 24,052 | 66,354 | 1920 | 5,450 | 27,825 |
| 1902 | 33,490 | 43,411 | 1921 | 8,298 | 43,192 |
| 1903 | 21,944 | 53,106 | 1922 | 4,624 | 13,570 |
| 1904 | 45,280 | 175,680 | 1923 | 2,945 | 11,780 |
| 1905 | 24,753 | 60,436 | | | |
| | | | Totals..... | 1,175,770 | \$3,617,233 |

BORATES.

During 1923, there was produced in California a total of 118,601 tons of borate materials, compared with a total of 74,998 tons for the year 1922. The material shipped included crude and selected colemanite ores from Inyo, Los Angeles, and San Bernardino counties, varying from 18.29% to 28.24% anhydrous boric acid ('A. B. A.'), also crystallized borax recovered from evaporation of brines at Searles Lake, San Bernardino County.

As the crude ore is not sold, as such, and is almost entirely calcined before shipping to the refinery for conversion into the borax of commerce, it is difficult to arrive at a valuation of the crude ore as mined. For this reason and the fact that the material varied in boric acid content, we have recalculated the tonnage to a basis of 40% A. B. A., which is approximately the average A. B. A. content of the colemanite material after calcining for shipment to the refinery. A valuation of 50¢ per unit of 'anhydrous boric acid' was reported for the calcined material. Recalculated as above, the 1923 production totals 62,667 tons valued at \$1,893,798, an increase over the similar figures for 1922 which were 39,087 tons and \$1,068,025.

Total Production of Borate Materials in California.

The total production of borate materials in California is shown in the following table:

| Year | Tons | Value | Year | Tons | Value |
|------|-------|---------|--------|---------------------|--------------|
| 1864 | 12 | \$9,478 | 1894 | 5,770 | \$807,807 |
| 1865 | 126 | 94,099 | 1895 | 5,959 | 595,900 |
| 1866 | 201 | 132,538 | 1896 | 6,754 | 675,400 |
| 1867 | 220 | 156,137 | 1897 | 8,000 | 1,080,000 |
| 1868 | 32 | 22,384 | 1898 | 8,300 | 1,153,000 |
| 1869 | | | 1899 | 20,357 | 1,139,882 |

CEMENT.

Cement is the most important single structural material in the output of this state. During 1923, there was produced a total of 10,825,405 barrels, valued at \$25,999,203 f. o. b. plant, being an increase both in quantity and value over that of any previous year in the history of the cement industry in California. As in the preceding two years, the output came from nine operating plants in seven counties, and in 1923 employing a total of 3448 men.

The three plants in San Bernardino County, in 1923, made a total of 3,554,764 barrels of cement, valued at \$8,478,612, the balance of the state's product coming collectively from a single plant in each of the following counties: Contra Costa, Kern, Riverside, San Benito, Santa Cruz, and Solano. A tenth plant is at present under construction at Merced, in Merced County, and will probably be in operation before the close of the current year.

Cement Production of California by Years.

Annual production of cement in California has been as follows:

| Year | Barrels | Value | Year | Barrels | Value |
|------|-----------|-----------|--------|-------------|---------------|
| 1891 | 5,000 | \$15,000 | 1908 | 1,629,615 | \$2,359,692 |
| 1892 | 5,000 | 15,000 | 1909 | 3,779,205 | 4,969,437 |
| 1893 | | | 1910 | 5,453,193 | 7,485,715 |
| 1894 | 8,000 | 21,600 | 1911 | 6,371,369 | 9,085,625 |
| 1895 | 16,383 | 32,556 | 1912 | 6,198,634 | 6,074,661 |
| 1896 | 9,500 | 28,250 | 1913 | 6,167,806 | 7,743,024 |

Plant of Monolith Portland Cement Company, at Monolith, Kern County, California.

CHROMITE.

Chromic iron ore, or chromite, to the amount of 78 short tons of all grades (or 84 tons, recalculated to a basis of 45% Cr_2O_3), valued at \$1,658 f. o. b. shipping point, was sold in California during the year 1923. The ore shipped analyzed from 45% to 50% Cr_2O_3 and came from mines in Placer and San Luis Obispo counties, being utilized for refractory purposes.

As will be noted from the tabulation below, chromite mining in California since the World War has all but become extinguished; and the

immediate future is not encouraging, unless a local or Pacific Coast market develops for it. Development of the steel industry and the resumption of copper smelting may create some demand for California chromite.

Total Chromite Production of California.

Production of chromite in California began, apparently, about 1874, principally in San Luis Obispo County. There was considerable activity from 1880 to 1883, inclusive, and a total of 23,238 long tons (or 26,028 short tons), valued at \$329,924 was shipped from that county up to the beginning of 1887. Some ore also was shipped from the Tyson properties in Del Norte County. The tabulation herewith shows the output of chromite in California, annually, including the earliest figures so far as they are available. The figures from 1887 to date are from the records of the State Mining Bureau:

| Year | Tons | Value | Year | Tons | Value |
|-------------------------------------|--------|-----------|--------------|---------|-------------|
| 1874-1886 (San Luis Obispo Co.) --- | 26,028 | \$329,924 | 1905 ----- | 40 | \$600 |
| 1887 ----- | 3,000 | 40,000 | 1906 ----- | 317 | 2,859 |
| 1888 ----- | 1,500 | 20,000 | 1907 ----- | 302 | 6,040 |
| 1889 ----- | 2,000 | 30,000 | 1908 ----- | 350 | 6,195 |
| 1890 ----- | 3,599 | 53,985 | 1909 ----- | 426 | 5,309 |
| 1891 ----- | 1,372 | 20,580 | 1910 ----- | 749 | 9,707 |
| 1892 ----- | 1,500 | 22,500 | 1911 ----- | 935 | 14,197 |
| 1893 ----- | 3,319 | 49,785 | 1912 ----- | 1,270 | 11,260 |

*Recalculated to 45% Cr₂O₃, beginning with 1919.

MAGNESITE.

The production of magnesite in California during 1923 amounted to a total of 73,963 tons of crude ore valued at \$946,643. Only a small part of it was sold 'crude,' however, as it is practically all shipped in the calcined form. The reports at hand show a total of 30,294 tons shipped calcined, of which 3475 tons were dead-burned and sold for refractory purposes, the balance going to the plastic trade. From 2 to 2½ tons of crude material are mined to make one ton of the calcined. The 1923 output is an increase both in quantity and value over the 1922 figures of 55,637 tons crude valued at \$594,665.

The more important producing properties in 1923 were: Maltby No. 1 (Western Magnesite Development Company, operated under lease by C. S. Maltby) on Red Mountain, Santa Clara County; and the Sierra Magnesite Company's group near Porterville, Tulare County; followed, in order, by the Sampson Peak Mine (Maltby No. 3), San Benito

County, Maltby No. 2 in Chiles Valley, Napa County, and the California Magnesite Company (old Harker mine) at Porterville. Lesser amounts were reported mined in Stanislaus, Tuolumne and Fresno counties, in the order named. Descriptions of recent operations at most of the above-mentioned properties were given by the writer, in the January issue of 'Mining in California'.¹

The increase in value for 1923 is due in part to the somewhat higher prices prevailing as compared to 1922. On the whole, the magnesite industry is in a fairly satisfactory condition; the market is firm, and the use of this material, particularly the plastic form, is increasing on the Pacific Coast. Because of high freight rates, California can not

Open cut at Sampson Peak (Maltby No. 3) Magnesite Mine, near New Idria, San Benito County, California.

compete in the Atlantic seaboard states with foreign importations, but can at least hold its own as far east as the Mississippi River, under present conditions.

Distribution of the 1923 product, by counties, was as follows:

| County | Tons | Value |
|--|--------|-----------|
| Santa Clara ----- | 36,390 | \$472,620 |
| Tulare ----- | 24,058 | 298,272 |
| Fresno, Napa, San Benito, Stanislaus, Tuolumne*----- | 13,515 | 175,751 |
| Totals----- | 73,963 | \$946,643 |

*Combined to conceal output of a single operator in each.

¹ See pp. 23, 26-31, *ante*.

Total Magnesite Production of California.

The first commercial production of magnesite in California was made in the latter part of 1886 from the Cedar Mountain district,¹ southeast of Livermore, Alameda County. Shipments amounting to 'several tons' or 'several carloads' were sent by rail to New York; but there is apparently no exact record of the amount for that first year. The statistical records of the State Mining Bureau began with the year 1887, and the table herewith shows the figures for amount and value, annually, from that time. Shipments of magnesite from Napa County began in 1891 from the Snowflake Mine; from the Red Mountain deposits in Santa Clara County, in 1899; and from Tulare County in 1900.

Production of Magnesite in California, Since 1887.

| Year | Tons | Value | Year | Tons | Value |
|------------|-------|---------|--------------|---------|-------------|
| 1887 ----- | 600 | \$9,000 | 1906 ----- | 4,032 | \$40,320 |

| | | | Totals ----- | 903,465 | \$8,927,866 |

MAGNESIUM SALTS.

The production of magnesium chloride and sulphate in California during 1923 totaled 3662 tons, valued at \$116,031, an increase both in quantity and value over the 1922 figures of 3036 tons and \$89,788. This was nearly all chloride, sold for use in magnesite stucco and cement mixtures (Sorel cement), and was prepared from residual bitters at salt plants in Alameda, Los Angeles, San Diego, and San Mateo counties. It was in part marketed in the liquid form. With the use of magnesite cement and stucco coming more into vogue in building construction on the Pacific Coast, the demand for magnesium chloride is increasing here; but the domestic article has to meet the competition of the cheaper, imported German chloride.

Total Production of Magnesium Salts in California.

The total production of magnesium salts in California since the beginning of the industry here, is shown in the following tabulation:

¹See U. S. Geol. Surv.; Mineral Resources of U. S., 1886, pp. 6 and 696.

| Year | Tons | Value |
|--------|--------|-----------|
| 1916 | 851 | \$6,407 |
| 1917 | 1,064 | 34,973 |
| 1918 | 1,008 | 29,955 |
| 1919 | 1,616 | 82,457 |
| 1920 | 3,150 | 107,787 |
| 1921 | 4,153 | 106,140 |
| 1922 | 3,036 | 89,788 |
| 1923 | 3,662 | 116,031 |
| Totals | 18,540 | \$573,538 |

MANGANESE.

Manganese ore shipments in California in 1923 amounted to a total of 690 tons of all grades, valued at \$10,620, being a slight increase in both quantity and value over the 1922 yield which totaled 540 tons and \$7,650 value. These ores were utilized mainly by the brick, paint, and glass trade, with a small tonnage of high-grade ore going to electric dry-battery manufacture.

Manganese Ore Production in California, by Years.

Production of manganese ore in California began at the Ladd Mine, San Joaquin County, in the Tesla District in 1867. When shipments of this ore to England ceased late in 1874, upwards of 5000 tons had been produced by that property. For some years following that, the output was small. The tabulation herewith shows the California output of manganese ore, annually, since 1887, when the compilation of such figures was begun by the State Mining Bureau:

| Year | Tons | Value | Year | Tons | Value |
|------|-------|---------|--------|--------|-------------|
| 1887 | 1,000 | \$9,000 | 1906 | 1 | \$30 |
| 1888 | 1,500 | 13,500 | 1907 | 1 | 25 |
| 1889 | 53 | 901 | 1908 | 321 | 5,785 |
| 1890 | 386 | 3,176 | 1909 | 3 | 75 |
| 1891 | 705 | 3,830 | 1910 | 265 | 4,235 |
| 1892 | 300 | 3,000 | 1911 | 2 | 40 |
| 1893 | 270 | 4,050 | 1912 | 22 | 400 |
| 1894 | 523 | 5,512 | 1913 | | |
| 1895 | 880 | 8,200 | 1914 | 150 | 1,500 |
| 1896 | 518 | 3,415 | 1915 | 4,013 | 49,098 |
| 1897 | 504 | 4,080 | 1916 | 13,404 | 274,601 |

Domestic Manganese Resources.

The subcommittee on manganese of the Mining and Metallurgical Society of America has recently made public its findings on the situation in the United States as regards apparent domestic resources of manganese ores. We quote, herewith, a summary¹ of portions of their report and conclusions:

"To determine the adequacy or inadequacy of the domestic resources the committee first considers domestic requirements, putting them under two heads, metallurgical and chemical. About 95 per cent of the total amount consumed is used in making steel and, to a small extent, in foundries and for special alloys. It is used principally in three forms: ferromanganese, spiegeleisen, and manganiferous pig iron. The availability of an ore for making any one of these alloys is governed largely by its ratio of manganese to iron.

"The committee, in its estimate, assumes that an output of 50,000,000 tons of steel will be reached in the United States between 1930 and 1935, requiring an amount of metallic manganese estimated at 13 lb. per ton, or 290,000 long tons. To this it adds 10,000 tons metallic manganese for the foundry business and special alloys.

"The remaining 5 per cent of total manganese consumed is used in chemical industries, and the ore is therefrom termed 'chemical' ore. Most of it goes into dry batteries. Total pre-war requirements were about 35,000 tons.

"In estimating the adequacy of domestic resources the committee first had to define 'ore.' With changing conditions as to cost and price, the report points out, the measure of ore reserved must also change, there being a constant shifting back and forth across the border line between ore and waste. Before the war, save for a few thousand tons, the United States had no high-grade manganese ores. With artificial war conditions, however, prices soared and standards lowered, so that in 1918 the United States produced 305,000 tons of ferro-grade ore, furnishing 23.6 per cent of the manganese used. In addition to this, 86 per cent of the manganese used in low-grade products came from domestic sources. This proved that under artificial war conditions the United States possessed considerable domestic resources of high-grade as well as low-grade ores.

"Since the armistice, there has been a strong tendency to revert to the pre-war situation, though impeded by unsettled conditions, particularly in Europe and the Near East, and more recently by the tariff set up by Congress.

"In brief, says the report, under natural conditions the United States has practically no commercial high-grade manganese ores.

"The committee, therefore, has sought to find out how highly artificial conditions need be to shift important quantities of manganese-bearing material across the border line from waste to ore. It has reviewed 1850 manganese deposits and prospects and studied all information as to their history, production, and possibilities. It was first necessary to determine upon a yard-stick for measuring ore.

"The committee became convinced that a price equivalent to at least 50 per cent more than the highest price obtaining during the late war would be needed to make really considerable quantities of ferro-grade ore commercially available.

"Applying these assumptions to its study of ore deposits the committee arrived at the estimates of ore reserves, by classes of ore and by states, that are given in detail in the report.

"Study of these figures shows that the reasonably probable ferro-grade reserves, measured by the high price adopted, would last the country two years, or, if reasonable probabilities are included, a little over four years. Geological conditions are sufficiently well known to make it unlikely that other amounts of importance will be found.

"Of chemical ores there would appear to be about eight years' supply, measured by the \$50 index price. Much of this could be produced at lower prices.

"Domestic reserves of spiegel and high manganese pig ores are more abundant, indicating thirty-five to forty years' supply.

"The committee concludes that:

"1. Domestic resources of ferro-grade ores are totally inadequate. No conceivably reasonable legislation can remedy this.

"2. Reserves of chemical ores are adequate for tiding over an emergency, but inadequate from the point of view of continuous supply. Legislation might cause domestic needs to be furnished from domestic sources for a limited time, but the resulting depletion would seriously endanger the country in a time of possible future critical need.

"3. The comparative adequacy of the reserves for spiegel and high-manganese-pig ores fairly raises the question whether some measure of protection, designed to foster their adaptation to industry, would be reasonable.

"Discussing this last question, the report talks of a tariff not high enough to bring about any considerable production of domestic ferro-grade ores, but still high enough to increase the price of ferromanganese to a point where there would be a strong inducement to steelmakers to substitute leaner materials, made from the more or less abundant lean domestic ores.

"The conservation of high-grade manganese by substituting high-manganese pig iron for ferro in making additions to the charge is commendable, says the report, but, being already recognized as a possible economy in steel making, the practice will

¹ See Engineering & Mining Journal-Press, Vol. 117, No. 13, p. 545, Mar. 29, 1924.

proceed of its own momentum, and it is doubted if it can be speeded up by a tariff on high-grade materials, which would place a burden on the steel industry.

"Substitution of spiegel for ferro, on the other hand, could no doubt, be increased by a high tariff on ferro and ferro ores, says the report. Possibly as much as a half of the total steel output could be made with spiegel. But the report points out that among steel makers there is strong prejudice against changing practice in this direction, because ferro is easier to use, surer in its results, and for these reasons cheaper.

"A brief description of foreign resources, at the end, serves to show the comparative insignificance of domestic reserves, and demonstrates why the United States has drawn its supplies from these outside sources.

"The subcommittee concludes:

"1. The domestic resources of ferro-grade and chemical ores are so out of balance with the major foreign resources that, under natural conditions of foreign exchange, imports of such ores can be efficiently stopped only at great cost.

"2. Should legislation be passed which should effect a measurable substitution of domestic for foreign ferro ores, the chief result, aside from cost, would be the dangerous depletion of reserves, which as it is inadequate for domestic needs,

"3. Domestic resources of low-grade reserves, on the other hand, are comparatively adequate. Any effective attempt, however, to force their adaptation to the country's needs beyond the normal development which may be looked for through increase in skill and a vigorous educational campaign would result in a cost so enormous as to be quite disproportionate to the purpose to be served."

The report is signed by C. M. Weld, chairman; J. W. Furness, D. F. Hewett, Robert Linton, John A. Mathews, J. V. W. Reynnders, and Bradley Stoughton.

POTASH.

During 1923, a total of 29,597 tons of potash salts of all grades was produced in California, valued at \$709,836, compared with 17,776 tons and \$584,388 in 1922. This included potassium chloride from salt-works bitterns and from Searles Lake brine, and sulphate from Portland-cement dust. The quality varied from 34% to 60.5% equivalent K_2O content, the salt being produced at plants in San Bernardino, San Mateo, and Santa Cruz counties. Some potassium chloride was also made at one plant in Alameda County, but not sold as it is intended to convert it into other forms. The product sold was utilized for the manufacture of fertilizers.

Total Production of Potash in California.

The annual amounts and value of these potash materials since their beginning in California in 1914, are shown by the following table:

| Year | Tons | Value |
|--------|---------|--------------|
| 1914 | 10 | \$460 |
| 1915 | 1,076 | 19,391 |
| 1916 | 17,908 | 663,605 |
| 1917 | 129,022 | 4,202,889 |
| 1918 | 49,381 | 6,808,976 |
| 1919 | 23,118 | 2,415,963 |
| 1920 | 26,298 | 1,465,463 |
| 1921 | 14,806 | 390,210 |
| 1922 | 17,776 | 584,388 |
| 1923 | 29,597 | 709,836 |
| Totals | 313,992 | \$17,267,181 |

PYRITES.

A total production of 148,004 short tons of pyrites, valued at \$555,308, was reported shipped in California during 1923, from properties operated in Alameda, Mariposa, and Shasta counties. This was a slight decrease in both tonnage and value from the figures of 151,381 tons and \$570,425 in 1922. The material was mostly used in the manufacture of sulphuric acid, but a portion was utilized directly in the

preparation of agricultural fertilizer and insecticide. The sulphuric acid made is mainly used in the manufacture of explosives and of fertilizers.

Pyrites Production in California, by Years.

The total recorded pyrites production in California to date is as follows:

| Year | Tons | Value | Year | Tons | Value |
|------|---------|-----------|--------|-----------|-------------|
| 1898 | 6,000 | \$36,000 | 1911 | 54,225 | \$182,954 |
| 1899 | 5,400 | 28,620 | 1912 | 69,872 | 203,470 |
| 1900 | 3,642 | 21,133 | 1913 | 79,000 | 218,537 |
| 1901 | 4,578 | 18,429 | 1914 | 79,267 | 230,058 |
| 1902 | 17,525 | 60,306 | 1915 | 92,462 | 293,148 |
| 1903 | 24,311 | 94,000 | 1916 | 120,525 | 372,969 |
| 1904 | 15,043 | 62,992 | 1917 | 111,325 | 323,704 |
| 1905 | 15,503 | 63,958 | 1918 | 128,329 | 425,012 |
| 1906 | 46,689 | 145,895 | 1919 | 147,024 | 540,300 |
| 1907 | 82,270 | 251,774 | 1920 | 146,001 | 590,581 |
| 1908 | 107,081 | 610,335 | 1921 | 110,025 | 473,735 |
| 1909 | 457,867 | 1,389,802 | 1922 | 151,381 | 570,425 |
| 1910 | 42,621 | 179,862 | 1923 | 148,004 | 555,368 |
| | | | Totals | 2,265,970 | \$7,877,357 |

SOAPSTONE and TALC.

The total output of talc and soapstone in California in 1923 amounted to 17,439 tons valued at \$252,661, compared with 13,378 tons valued at \$197,186 in 1922. More than two-thirds of the product was high-grade talc from Inyo and San Bernardino counties, which material was utilized mainly in toilet powders, paint, paper, and rubber manufacture, and in part in magnesite flooring and stucco. The 'soapstone' grades were used mainly for roofing and as a filler in roofing paper, and part also in magnesite cement.

A detailed description of the classification and uses of talc and soapstone is given in Bulletin No. 93¹ issued by the State Mining Bureau in 1923, copies of which may be had on application.

Talc Production of California, by Years.

Production has been intermittent in the state since 1893, as shown in the following table:

| Year | Tons | Value | Year | Tons | Value |
|------|------|----------|--------|--------|-------------|
| 1893 | 400 | \$17,750 | 1909 | 33 | \$280 |
| 1894 | | | 1910 | 740 | 7,260 |
| 1895 | 25 | 375 | 1911 | | |
| 1896 | | | 1912 | 1,750 | 7,350 |
| 1897 | | | 1913 | 1,350 | 6,150 |
| 1898 | | | 1914 | 1,000 | 4,500 |
| 1899 | | | 1915 | 1,663 | 14,750 |
| 1900 | | | 1916 | 1,703 | 9,831 |
| 1901 | 10 | 119 | 1917 | 5,267 | 45,279 |
| 1902 | 14 | 288 | 1918 | 11,760 | 85,534 |
| 1903 | 219 | 10,124 | 1919 | 8,764 | 115,091 |
| 1904 | 228 | 2,315 | 1920 | 11,327 | 221,362 |
| 1905 | 300 | 3,000 | 1921 | 8,752 | 130,078 |
| 1906 | | | 1922 | 13,378 | 197,186 |
| 1907 | | | 1923 | 17,439 | 252,661 |
| 1908 | 3 | 48 | Totals | 86,125 | \$1,131,331 |

LABORATORY.

FRANK SANBORN, Mineral Technologist.

Letters are frequently received at this bureau from prospectors who seek information as to how certain minerals can be identified in the field. It is not always easy to give simple and satisfactory replies to these inquiries, for some minerals, such as the aluminum silicates which are now in demand, are not always readily identified even when a well-equipped laboratory is at hand. Many of the samples received at the bureau's laboratory are merely more or less decomposed or altered rocks having no commercial value.

There are some of the physical properties of minerals that can be easily learned by a prospector, and by learning these properties it is possible that the worth-while minerals can be identified and prospecting made more interesting.

Hardness. With a little practice the hardness of a mineral can be estimated rather closely by the ease with which it can be scratched with a knife blade.

In the scale of hardness generally used a knife blade has a hardness of a little over 5, while ordinary window glass is usually a little harder, having a hardness of about 5.5; therefore a knife blade will not readily scratch glass. Quartz has a hardness of 7, consequently a knife blade will not scratch quartz, but the quartz will readily scratch glass.

Moh's scale of hardness is as follows: Talc (1), Gypsum (2), Calcite (3), Fluorite (4), Apatite (5), Feldspar (6), Quartz (7), Topaz (8), Corundum (9), Diamond (10).

Gypsum with a hardness of 2 can be scratched with the finger nail. A copper coin has a hardness of 3, and a pin point has a hardness of about 3.5. Care must be taken to distinguish between a *mark* left by one mineral on another and a *scratch*.

Cleavage. Many minerals when struck a sharp, quick blow with a hammer, have the property of breaking with smooth surfaces in certain directions which are parallel to actual or possible crystal faces. This property is called cleavage, and it may be exhibited in only one direction as in mica, or in several directions as in calcite.

Common cleavages are: 'cubic' as shown when a cube of galena is fractured, and 'rhombohedral' as when a piece of calcite is cleaved. Mica exhibits a good example of 'basal' cleavage, and feldspars have a cleavage in two directions, at, or nearly at right angles, while quartz has no cleavage.

Specific Gravity. The specific gravity of a substance is the ratio of its weight to the weight of an equal volume of water, the weight of water being taken as 1.0. Thus quartz has a specific gravity of approximately 2.6 which means that it is 2.6 times heavier than the same volume of water. Lead has a specific gravity of 11.37 and is therefore 11.37 as heavy as an equal volume of water. The mineral barite has a specific gravity of 4.5 and can be distinguished from limestone and other common minerals which it resembles by its 'heavy feeling,' calcite having a specific gravity of 2.72.

Streak. The 'streak' of a mineral is merely the color of its powder. A piece of chert or quartz will often answer as a streak-plate. By rubbing a piece of hematite on a piece of quartz a red powder will adhere to the quartz, yellow for limonite, brown for chromite, etc.

Panning. Many minerals of value though disseminated through a rock can be concentrated by panning. The material to be tested in this way should be ground to a uniform size if possible, and panned carefully in a clean pan (a small frying or egg pan, free from grease, makes an excellent gold pan). In panning, care should be taken not to mistake little fragments of the mortar or pestle for a mineral. It is a good policy to use a magnet on the concentrates, if there is any doubt as to whether or not they are of iron. By careful panning a great many minerals can be concentrated and subsequently identified. Panning should not be considered merely as a method for detecting only gold in rock, for when carefully manipulated, a gold pan can bring to light most of the minerals having a higher gravity than quartz.

The State Mining Bureau endeavors to assist prospectors in every way, and will gladly advise in specific cases. During the four-month period covered by this report 1292 samples were received and determined at the laboratory.

LIBRARY.

FOREST L. CAMPBELL, Librarian.

In addition to the numerous standard works, authoritative information on many phases of the mining and mineral industry is constantly being issued in the form of reports and bulletins by various government agencies.

The library of the State Mining Bureau contains some five thousand selected volumes on mines, mining and allied subjects, and it is also a repository for reports and bulletins of the technical departments of federal and state governments and of educational institutions, both domestic and foreign.

It is not the dearth of the latter publications, but rather a lack of knowledge of just what has been published and where the reports may be consulted or obtained, that embarrasses the ordinary person seeking specific information.

To assist in making the public acquainted with this valuable source of current technical information, 'Mining in California' contains under this heading a list of all books and official reports and bulletins received, with names of publishers or issuing departments.

Files of all the leading technical journals will be found in the library, and county and state maps, topographical sheets and geological folios. Current copies of local newspapers published in the mining centers of the State are available for reference.

The library and reading room are open to the public during the usual office hours, when the librarian may be freely called upon for all necessary assistance.

PRODUCERS AND CONSUMERS.

The producer and consumer of mineral products are mutually dependent upon each other for their prosperity, and one of the most direct aids rendered by the Bureau to the mining industry in the past has been that of bringing producers and consumers into direct touch with each other.

This work has been carried on largely by correspondence, supplemented by personal consultation. Lists of buyers of all the commercial minerals produced in California have been made available to producers upon request, and likewise the owners of undeveloped deposits of various minerals, and producers of them, have been made known to those looking for raw mineral products.

When the publication of MINING IN CALIFORNIA was on a monthly basis, current inquiries from buyers and sellers were summarized and lists of mineral products or deposits 'wanted' or 'for sale' included in each issue.

It is important that inquiries of this nature reach the mining public as soon as possible and in order to avoid the delay incident to the present quarterly publication of MINING IN CALIFORNIA, these lists are now issued monthly in the form of a mimeographed sheet under the title of 'Commercial Mineral Notes.'

EMPLOYMENT SERVICE.

Following the establishment of the Mining Division branch offices in 1919, a free technical employment service was offered as a mutual aid to mine operators and technical men for the general benefit of the mineral industry.

Briefly summarized, men desiring positions are registered, the cards containing an outline of the applicant's qualifications, position wanted, salary desired, etc., and as notices of 'positions open' are received, the names and addresses of all applicants deemed qualified are sent to the prospective employer for direct negotiations.

Telephone and telegraphic communications are also given immediate attention.

The Bureau registers technical men, or those qualified for supervisory positions, and vacancies of like nature, only, as no attempt will be made to supply common mine and mill labor.

A list of current applications for positions and 'positions open' is carried in each issue. Notices are designated by a key number, and the name and address corresponding to any number will be supplied upon request, without delay or charge of any kind. If desired, recommendations may be filed with an application, but copies only should be sent to the Bureau, to avoid possible loss. Registration cards for the use of both prospective employers and employees may be obtained at any office of the Bureau upon request, and a cordial invitation is extended to the industry to make free use of the facilities afforded.

POSITIONS WANTED.

- 21-19 Draftsman. Technical education. Sixteen years' experience, mostly foreign, construction, mining and railroad work. Age 36; married. References. Salary wanted, \$300.
- 21-20 Mine Foreman. Sixteen years' experience, Colorado and Nevada. Age 43; married. References. Salary open.
- 21-21 Exploration and examination. Three and one-half years as engineer, Malay States. Age 28; single. References. Salary wanted, \$200.
- 21-22 Mine Superintendent. Technical graduate. Sixteen years' experience. Age 38; married. References. Salary open.
- 21-23 Construction Engineer. Two and one-half years' experience. References. Salary open.
- 21-24 Mining Engineering. Technical graduate. Some experience. Age 24. Salary open.
- 21-25 Chemical or electrical work. Experience electrical and cyanide work. Age 47; single. References. Salary wanted, \$150.
- 21-26 Chemist. Seventeen years' experience, cement, fertilizer and sulphuric acid plants. Age 38; married. References. Salary wanted, \$175.
- 21-27 Foreman or Master Mechanic.
- 21-28 Mining Engineering. Main experience in metallurgical end.
- 21-29 Mine Superintendent. Specialty, quicksilver reduction. Experience in Scott and rotary furnace operation. Married. References. Salary open.
- 21-30—Mill work. Graduate metallurgical engineer. No experience except a little mining at Butte, Montana. Four years' banking experience. Age 28; single. References.
- 21-31 Position with mining enterprise or irrigation project. Graduate mining engineer. Varied and extensive experience in executive positions in British Columbia, Alaska and California, 1896 to date. Age 48; married. Excellent recommendations. Salary open.

PUBLICATIONS OF THE CALIFORNIA STATE MINING BUREAU.

During the past forty-four years, in carrying out the provisions of the organic act creating the California State Mining Bureau, there have been published many reports, bulletins and maps which go to make up a library of detailed information on the mineral industry of the state, a large part of which could not be duplicated from any other source.

One feature that has added to the popularity of the publications is that many of them have been distributed without cost to the public, and even the more elaborate ones have been sold at a price which barely covers the cost of printing.

Owing to the fact that funds for the advancing of the work of this department have often been limited, many of the reports and bulletins mentioned were printed in limited editions which are now entirely exhausted.

Copies of such publications are available, however, in the Bureau's offices in the Ferry Building, San Francisco; Pacific Finance Building, Los Angeles; in Santa Maria; Santa Paula; Coalinga; Taft; Bakersfield, and Sacramento. They may also be found in many public, private and technical libraries in California and other states, and foreign countries.

A catalog of all publications of the Bureau, from 1880 to 1917, giving a synopsis of their contents, is issued as Bulletin No. 77.

Publications in stock may be obtained by addressing any of the offices of the State Mining Bureau and enclosing the requisite amount in the case of publications that have a list price. The Bureau is authorized to receive only coin, stamps or money orders, and it will be appreciated if remittance is made in this manner rather than by personal check.

The prices noted include delivery charges to all parts of the United States. Money orders should be made payable to the State Mining Bureau.

DETERMINATION OF MINERAL SAMPLES.

Samples (limited to three at one time) of any mineral found in the state may be sent to the Bureau for identification, and the same will be classified free of charge. No samples will be determined if received from points outside the state. It must be understood that no assays, or quantitative determinations will be made. Samples should be in lump form if possible, and marked plainly with name of sender on outside of package, etc. No samples will be received unless delivery charges are prepaid. A letter should accompany sample, giving locality where mineral was found and the nature of the information desired.

THE STATE MINING BUREAU
CORDIALLY INVITES YOU TO VISIT
ITS VARIOUS DEPARTMENTS MAINTAINED
FOR THE PURPOSE OF FURTHERING
THE DEVELOPMENT OF THE
MINERAL RESOURCES OF CALI-
FORNIA

At the service of the public are the scientific reference library and reading room, the general information bureau, the laboratory for the free determination of mineral samples found in the state, and the largest museum of mineral specimens on the Pacific Coast. The time and attention of the State Mineralogist, as well as that of his technical staff, is also at your disposal.

Office hours: 9 a.m. to 5 p.m. daily.

Saturday, 9 a.m. to 12 m.

PREFACE.

The State Mining Bureau is maintained for the purpose of assisting in all possible ways in the development of California's mineral resources.

As one means of offering tangible service to the mining public, the State Mineralogist for many years has issued an annual or a biennial report reviewing in detail the mines and mineral deposits of the various counties.

The weak point in work of this character has been that the results of field investigations were so long in preparation that they had lost much of their usefulness by the time they finally appeared in print.

As a progressive step in advancing the interests of the mineral industry, publication of the Annual Report of the State Mineralogist in the form of monthly chapters was begun in January, 1922, and continued until March, 1923.

Owing to a lack of funds for printing, quarterly publication was begun in September, 1923.

For the same reason, beginning with the January, 1924, issue, it has been necessary to charge a subscription price of \$1 per calendar year, payable in advance; single copies, 25 cents apiece. 'Mining in California' will continue to be sent without charge to our exchange list, including schools and public libraries, as are also other publications of the State Mining Bureau.

Pages are numbered consecutively throughout the year and an index to the complete reports is included annually in the closing number.

Such a publication admits of several improvements over the old method of procedure. Each issue contains a report of the current development and mining activities of the state, prepared by the district mining engineers. Special articles dealing with various phases of mining and allied subjects by members of the staff and other contributors are included. Mineral production reports formerly issued only as an annual statistical bulletin are published herein as soon as returns from producers are compiled. The executive activities, and those of the laboratory, museum, library, employment service and other features with which the public has had too little acquaintance also are reported.

While current activities of all descriptions will be covered in these chapters, the Bureau will not discontinue its practice of issuing from time to time technical reports on special subjects. A list of such reports now available is appended hereto, and the names of new bulletins will be added in the future as they are completed.

The chapters will be subject to revision, correction and improvement. Constructive suggestions from the mining public will be gladly received, and are invited.

The one aim of the Mining Bureau is to increase its usefulness and to stimulate the intelligent development of the wonderful, latent resources of the State of California.

DISTRICT REPORTS OF MINING ENGINEERS.

In 1919-1920 the Mining Department was organized into four main geographical divisions, with the field work delegated to a mining engineer in each district working out from field offices that were established in Redding, Auburn, San Francisco and Los Angeles, respectively.

This move brought the Bureau into closer personal contact with operators, and it has many advantages over former methods of conducting field work.

To continue this system most effectively with the limited funds available for the present biennium, the Redding and Auburn field offices were consolidated and moved to Sacramento on June 1, 1923.

The boundaries of each district were adjusted and the counties now included in each of the three divisions, and the locations of the branch offices, are shown on the accompanying outline map of the state. (Frontispiece.)

Reports of mining activities and development in each division, prepared by the district engineer, will continue to appear under the proper field division heading.

Although the petroleum industry is but little affiliated with other branches of mining, oil and gas are among the most valuable mineral products of California, and a report by the State Oil and Gas Supervisor on the current development and general conditions in the state's oil fields is included under this heading.

SACRAMENTO FIELD DIVISION.

C. A. LOGAN, Mining Engineer.

The increased amount of work at the Sacramento office, due to its central location and the enlarged district, and incidental to the livelier interest in mining, has raised the question as to whether or not the best service could be given the public, under present circumstances, by devoting time to work in the field or in the office, and less time has been available for field work than in the past. There have been few important changes to record in the general mining situation since the last report.

Amador County.

Sinking is going on at several of the deep mines on the Mother Lode in this county. Extended prospecting of a new orebody in the present bottom of the Plymouth Mine, through a winze and under difficult conditions, gave such gratifying results that the directors of the company decided to sink the shaft about 1000 feet or to the 4300 ft. level, inclined depth. The lowest level of the Argonaut Mine is at 4800 feet on the incline, where an orebody is being worked south of the shaft, and sinking is going on. The Kennedy is developing its orebody on the bottom level, which is a few feet deeper than the bottom of the Argonaut. The Moore Mine is sinking from the 800 level to 1000 level.

A new prospecting venture is under way on some claims in Drytown district known as the Consolidated Virginia group. These claims had previously been prospected at various shallow depths of a few hundred

feet by shafts which the present company plans to unwater. B. I. Hoxie is in charge.

A coal property in the lignite belt near Buena Vista has lately been under development by Morris and Darling Brothers.

Calaveras County.

COBALT.

Work was resumed upon the cobalt prospect near Sheep Ranch, since the publication of our January report, in which the prospect is mentioned. Boulders of smaltite ore have been encountered in sinking.

GOLD.

Finnegan Mine on Carson Hill has resumed work since the last report and the 10-stamp mill has been steadily operated lately.

A new compressor of greater capacity than the last has been installed at the *Jolly Tar* prospect near Altaville, but the unwatering of the workings had not been completed late in June.

Washington (Oslin) Mine, last operated by Bullion Hill Mining Co., is being reopened by a new company who plan to sink below the present adit level from which last operations were carried on.

Victor Land and Mineral Company temporarily suspended operation of their gravel mine near Altaville late in June.

On the *Bishop Estate*, between Vallecito and Angels Camp, A. H. McKenzie and associates are preparing to sink a shaft to explore the Central Hill channel which they have been drilling during the past year.

Work has been continuing at the *Slab Ranch Mine* on the Central Hill channel between the above mentioned properties, but the channel had not yet been bottomed late in June.

El Dorado County.

Victoria Lode Mine is a prospect in the Rescue district near the old Boulder Mine. A shaft has lately been sunk 30 feet and a drift run 50 feet. The owners report that 20 tons of ore recently crushed in the 2-stamp mill yielded \$8 a ton in free gold and that the vein is of good width. Grimshaw, Ferris and Cornelius, owners.

Vandalia Mining Co. N. C. Busby, president. Fred McCall, secretary-treasurer. Office, Sutter Hotel, Sacramento. The Vandalia was an early producer and was described by W. H. Storms in our Bulletin 18. It is about four miles south of Shingle Springs near the Oro Fino Mine and the ore deposit is distinguished from the ordinary vein deposits, being described as a "highly siliceous felsite impregnated with iron sulphide." The present company have been developing and testing the ore and preparing for operation. They claim to have considerable ore developed.

Hines Gilbert Gold Mines Co. Office in Sacramento. The property is in American River Canyon near Spanish Dry Diggings. Work has been financed for a number of years by local sales of stock. There is an adit about 450 feet long and other shorter workings and a depth

of 110 feet has been reached. Some small lots of very good ore have been milled during the past year, returns as high as \$40 a ton having been reported. The property is on the course of the Mother Lode and only one of the veins has been developed by the recent work. It was described in the 1920 report.

Nevada County.

It has just been reported that Empire Mines and Investment Company will take over and operate the *Sultana Mine*, adjoining the Empire. The positions of the workings of the two mines are such that this can be done advantageously from the Empire.

Golden Center Mine has been completely unwatered and is being explored for new orebodies.

Idaho-Maryland Mines Company continues work and has been making surface improvements, including a new hoist and strengthening of the headframe.

The report of *North Star Mines Company* for the year 1923 shows that the production fell from the usual figure of about a million dollars to \$741,336.67 and that there was a loss resulting from the year's operations. A large sum was spent searching for new orebodies.

Depressed financial conditions have been partly responsible for retarding development of some of the smaller properties in the Grass Valley district and a few of the operators have announced that they are giving up their options on account of the difficulty of raising money.

Placer County.

A test run of between 45 and 50 tons of ore was made early in June from the *American Bar Mine* near Michigan Bluff. The company reported this test showed an average of over \$32 a ton, with a loss of \$1.45 a ton in the tailing, and with concentrate worth only \$26.25 a ton. The test was made in the company's old 10-stamp mill on the property and seems to show that the ore is amenable to ordinary stamp-milling and concentration methods. The ore carries coarse gold. A previously reported average of assays of the exposed ore was about \$20 a ton. The property has been described in our June, 1922, report and in the April, 1924, issue.

Big Oak Mine near the Rising Sun Mine, just west of Colfax, is being reported in course of being reopened. The *Providence* claims in the Iowa Hill district have lately been taken under lease and option.

Siskiyou County.

A trip to the southern part of the county late in May permitted the gathering of information regarding a few properties not heretofore mentioned in Bureau reports. These are all in the Callahan and Scott Mountain district at the head of the South Fork of Scott River. This section of Scott River and the larger tributaries have some interesting gravel deposits but practically no gravel mining is being attempted at this time. The district was once the scene of dredging operations, and it is more than likely that dredging may be resumed at some

future time, if means can be found to overcome the difficulty of handling the large boulders. Another setback to mining in the district has been the hostile attitude of the largest landowner toward other operators who have tried to put properties in operation.

Ballinal Placer. R. F. Ballinal, Callahan. This mine is at the junction of Jackson Creek with the South Fork of Scott River, six miles south of Callahan, four and one-half miles of the distance being over a good road and the balance trail. Elevation is 4000 feet or more. The gravel lies between the two streams and may have been deposited by either of them when at a higher level. The bank is of moderate depth without overburden and there is a fairly good dump. There are some large boulders, characteristic of this section of the river, where the size of the wash is out of all proportion to the present size of the streams. A derrick would be required to handle these boulders. The gravel is free wash and has been ground sluiced in a small way by the owner, who has realized a small yearly return in coarse gold but has been able to handle only a very little gravel. Water is available under good head for hydraulicking and there are several acres that could be worked in the one piece, with other similar areas on the claim.

Chapman Prospect (quartz). This is on Scott Mountain seven miles from Callahan and one-half mile from the Callahan-Carrville road. In 1922 a 5-stamp mill was built at the foot of the mountain four miles or more from the prospect and ore was hauled down the mountain at great expense. About 40 tons milled are reported to have yielded \$856. This came from a narrow seam in a shaft 80 feet deep with about 20 feet of drift, where the pay was reported lost. Previous work in an adit had produced about an equal amount. Idle.

Fippen & Hayden (Boulder Creek) Placer. This comprises 60 acres on and near the contact of serpentine and granite. A decomposed dike along the contact carries seams and veins of quartz. Some rough gold, occasionally coarse, has been recovered from hydraulic mining operations in two pits opened on the dike, the total area worked being perhaps two acres. The total production has been small.

The property is equipped with 150 feet of 8-inch and 11-inch pipe and one giant and has two ditches, one of which is about two miles long and is in repair. Water is bought from the McKeen Mine at \$1 a year. There is a good head of water at the lower pit and the flow was probably 600 inches or more at the end of May this year. The claims are three miles from Callahan on Boulder Creek. M. E. Gardner, Callahan, is the lessee.

Six-Mile Creek Placer. A. E. Westover, 480 Pine street, San Francisco. This comprises 40 acres and lies at the junction of Six-Mile Creek and East Fork of Salmon River, eighteen miles from Callahan on the Callahan-Cecilville trail. It adjoins the old Root & Salsberg placer. As yet it has been only slightly prospected, having been found only last year. It is reported to be high ground, about 300 feet above the East Fork and believed to run parallel to it for about 1500 feet, though this is not certain on account of obscuring slides from the adjacent hill. Where exposed it is stated to be 200 feet wide and 14

feet deep. About two miles of ditch would be needed to supply water for hydraulicking. There is a cabin, blacksmith shop, three giants, 800 feet of 11-inch and 15-inch pipe and one-fourth mile of 2 ft. by 3 ft. flume belonging to the same owner on the adjoining property and available for use on this ground, and the water of Six-Mile Creek is available for piping under good head. Westover states a test of 200 cubic yards was encouraging.

Sugar Hill Mine. This property is about five and one-half miles southwest from Callahan on the same dike mentioned under the Fippen & Hayden placer. It also has been worked in the past as an hydraulic mine. During the present season Wolfskill & Lidstone have taken a lease and option and have begun prospecting the quartz possibilities of the ground. A quartz vein four feet thick is found in the dike and drifting to explore this vein was being started late in May.

LEAD.

On the Fippen & Hayden placer, described above, an adit of unknown length was run many years ago to prospect for lead. A small amount of good galena ore had been brought out of this adit and dumped. The present lessee, M. E. Gardner, sluiced off the soil overburden and exposed the edge of the vein in place above the old adit. The exposed section is about 30 feet long and the width of vein is from a few inches to one foot. It consists of barite carrying lumps and stringers of galena. Assays of the ore indicate a high lead content, sufficient to make the best samples a good shipping ore, and with a fair content of silver. The location of the vein so close to the igneous intrusive and the contact is a favorable factor. Ore could be concentrated by jigging and would have to be hauled to the railroad at Gazelle, about twenty-seven miles by road.

Other prospects of lead ore have been reported in the region eight to ten miles east of Callahan near the Gazelle road, but so far as could be learned, nothing but float has been found there yet.

REPORTED TIN PROSPECT.

During the past two years some publicity has been given an alleged discovery of tin ore near Kangaroo Lake in this county. This is a small mountain lake penned up behind an ancient moraine and covering an area of about 20 acres at an elevation of 6000 feet or more, sixteen and one-half miles by road and trail east of Callahan. The lake and immediate vicinity were visited late in May in order to learn something about this reported prospect if possible. So far as could be found by examination and inquiry, no work was being done there and none of the parties supposed to have located the claims were to be found.

The most interesting geologic feature of the region is the high cliff of coarsely crystalline rock rising on the southeast side of the lake. This rock, according to report from our laboratory, is composed almost entirely of soda-lime feldspar and hornblende with very little quartz. The crystal aggregates of hornblende and feldspar are in some cases several inches in the longest dimension, and the rock would probably be classed as a diorite pegmatite. Two places were found where a very little prospecting had been done in this formation

but samples taken at these places and tested in our laboratory failed to show any tin.

OTHER MINES.

Lack of time prevented extending the trip to other parts of the county which it is hoped can be reached in time for the next quarterly report. Mention should be made, however, of the difficulties of the placer miners this season on account of lack of water. Interesting developments are going on at the *Big Buzzard Quartz Prospect* near Happy Camp under the direction of H. C. Cutting. Machinery for a mill, which will use the Vandercook mercuric cyanide process, is on the ground, but the water shortage is given as a reason for delay in setting up the plant. At the *Independence Mine*, on the east side of Klamath River ten miles downstream from Happy Camp, very satisfactory production has been made this season from a short drift and a series of shallow winzes sunk below it. The production has been high grade gold ore.

Trinity County.

Parts of the county were visited in May and it was found that gold mining had been very quiet the past year, with very little work being done at the time of visit.

Hydraulic mining suffered from the extreme shortage of water. B. R. Brown, lessee of *La Grange Mine*, had only sufficient water for 60 hours run. The splendid water supply system maintained while the mine was fully active has been allowed to fall partly into decay. *Lorenz Bros.* closed down early in May. *Red Hill Placer*, near Junction City, had only eight days water supply for piping during the past season. *Nugget Bar Placer*, above Minersville, closed down in March after a short effort to operate.

The gold dredgers described in our December, 1922, report have been producing most of the gold mined in the county lately. These dredgers are on Trinity River from near Lewiston to above Trinity Center. The site of the town of Trinity Center has in part been given over to one of these dredging companies which has been getting satisfactory results.

Assessment work and prospecting for quartz ore is quite active, but so far as could be learned no quartz mills were being operated in the county during May. On the East Fork of North Fork of Trinity River eight to twenty miles from Junction City, a number of quartz prospectors are working. Work was started in May at the *Bully Choop Mine* in the southern part of the county sixteen miles southeast of Douglas City. At the *Trinity Bonanza King Mine*, United Trinity Mines, a corporation, had a crew of about twelve men employed in May retimbering some of the old workings and prospecting. A few men were also employed at the *Strode Mine* east of Carrville.

Tuolumne County.

Clio Vindicator Mines Co. completed their new 10-stamp mill and cyanide plant at the end of June and have begun making test runs. The ore is crushed in cyanide solution and the new Vandercook mercuric cyanide process is used. Runs so far made are reported to have given a satisfactory recovery.

Eagle Shawmut Mining Co. is sinking a winze, in which they plan to go 600 feet deeper than their present bottom level, which is at 2780 feet. The mill is being operated at part capacity and over 100 men are employed.

Further transactions have been announced concerning the *Experimental Gulch Mine* above Columbia. The United Mines Co. of California have undertaken to operate the property and announcement has been made that new territory will be explored. Work is planned on the *Gandolfo* and *Rocca* claims near Stent and on the *Josephine Prospect* four miles from that place. A recent strike has been reported from the *McCormick Mine* on the Tuolumne River above Jacksonville. There is also activity at a number of properties on the East Belt, with a few men employed in each case.

Springfield Tunnel and Development Company is persistently continuing the exploration of their large drift mining holdings near Sonora. The latest announcements are of an optimistic character and indicate the hope of the operators that they are about to enter a profitable section of the buried channels. The underground geology of the property was found to be unexpectedly complicated on account of the character of the bedrock.

Pacific Lime and Plaster Co. of Sonora has lately been adding to its plant in order to manufacture a greater variety of limestone products including hydrated products.

SAN FRANCISCO FIELD DIVISION.

C. McK. LAIZURE, Mining Engineer.

Alameda County.

Industrial Chemical Corporation. E. M. Vail, president; H. H. Vail, secretary; Carl W. Beckman, treasurer; home office, 3221 San Fernando Bldg., Los Angeles; local address, Newark, California. The company formerly operated a plant at San Diego, producing magnesium chloride, epsom salts, magnesite, and potash under the name California Chemical Company, Inc. The San Diego plant was sold in 1923 to the National Kellastone Co. of Chicago, Illinois, and Porterville, California, and since then activities have been transferred to Newark, Alameda County. A new plant has been erected on property leased from the Arden Salt Works at Newark, and bittern waters from the Arden works and other salt companies are purchased under contract.

This 'mother liquor' brine, or bittern, remaining after the sodium chloride (common salt) has crystallized out through solar evaporation and been removed mechanically at the salt works, is the raw material treated in the Industrial Chemical Corporation plant. By a carefully regulated process of evaporation in vacuum, using artificial heat, various other salts originally contained in the sea water are recovered in crystal form. Salts being produced on a commercial scale at the present time are magnesium chloride, epsom salts (hydrous magnesium sulphate), magnesium bromide, and potassium chloride.

Mission Lime Marl Deposit. This deposit is situated about one-quarter mile east of Mission San Jose. The property is under lease to T. D. Witherly, Box 52, Mission San Jose. The limestone, which is somewhat soft and decomposed, outcrops at the base of a small hill easily reached by good road. Mining is by open cut. The material is suitable for agricultural use, but the production to date has been small. Equipment consists of grizzly, small jaw crusher, Grundler mill, bucket elevator and

Industrial Chemical Corporation's Plant, Newark, California.

bin. An analysis of the material, as reported by the Pacific Chemical Laboratories, was as follows :

| | |
|------------------------|--------|
| Nitrogen ----- | 0.46% |
| Limestone ----- | 83.10% |
| Lime phosphate ----- | 0.59% |
| Potash (soluble) ----- | 0.46% |
| Undetermined ----- | 15.39% |

Similar material is said to occur at other points on the Witherly property, but no development has been done at these localities.

LOS ANGELES FIELD DIVISION.

W. B. TUCKER, Mining Engineer.

Inyo County.

Cerro Gordo Mine (lead, silver, zine) is situated in the Inyo range of mountains, near the summit of Cerro Gordo Peak, eight miles east of Keeler. Elevation 8500 feet. Owner, *Cerro Gordo Mines Company*, San Jose, Cal. In February, 1923, the mine was taken over under lease by the Natural Soda Products Company, Keeler, California. W. W. Waterson, president; J. S. Henderson, secretary; C. A. Stockton, manager.

GEOLOGY:

According to Knopf,¹

"The prevailing rock at the mine is a dense, fine-grained, white marble; with this are associated some interstratified slate, and a number of dikes of diorite and of monzonite porphyry which lie approximately parallel to the stratification of the inclosing beds.

"The rocks in the immediate vicinity of the mine are part of a formation of the Carboniferous Age which is extensively developed in the surrounding area. This formation consists principally of limestone, with some interstratified shale or slate and quartzite. A belt of shale, probably 300 feet thick, lies northwest of the mine, and is underlain by fine-grained, white quartzite, 100 feet thick. The strike is N. 30° W., and dip 45° W. * * *

"The intercalated beds of shale and quartzite prove useful horizon markers, and show faulting of complicated character has taken place, centering particularly at the Cerro Gordo Mine. * * *

"East of the mine the limestones as a rule dip eastward, the dip averaging 45° E. on Cerro Gordo Peak, and flattening farther east. * * * The examination of the geologic structure around Cerro Gordo therefore shows that the rocks have been subjected to severe faulting. Some of this faulting took place prior to the formation of the ore bodies, and some after the ore bodies had been formed, but the post-mineral faults are probably of much smaller magnitude than those of pre-mineral origin. Many faults are exposed in the underground workings of the Cerro Gordo Mine. * * *

"Northwest of Cerro Gordo monzonite porphyry forms a small mass intrusive in the surrounding shale. * * * In the mine occur dikes which appear to have been originally similar to the monzonite porphyry northwest of Cerro Gordo. These dikes are altered by shearing, primary mineralization, by oxidation, and by the downward percolation of sulphate solutions. * * *

"One of the most prominent dikes in the mine is that cut in the Union tunnel, in the footwall crosscut of the Santa Maria pit, where it is 50 feet wide, and in the Zero level. The dike apparently conforms in the main with the strike and dip of the bedding of the inclosing rocks. In the Union tunnel, however, the contacts are much shattered. The west contact strikes N. 15° W., and the east contact N. 35° W., both being nearly vertical. The dike is overlain by a shale belt 105 feet wide and is underlain by massive white marble. In the Zero level, which is several hundred feet south of the Union tunnel, the dike lies within the shale belt, and therefore probably cuts across the trend of the formation at a narrow angle. * * *

"Other dikes differing considerably from the monzonite porphyry were noted in the underground workings. They range in different dikes from 4 to 25 feet in thickness; on 900-foot level one of these dikes was found to be an intrusive into the monzonite porphyry. They are gray, fine-grained, granular diorites."

¹ Knopf, Adolph, Mineral resources of the Inyo and White Mountains, California: U. S. Geol. Surv., Bull. 540, pp. 100-103, 1912.

DEVELOPMENT:

The present company's development work is confined to the lead orebodies, on the 400', 700', 900', and 1000' levels.

The lead orebodies of Cerro Gordo consist of lenticular masses distributed through a zone 2000 feet long and several hundred feet wide. The predominant rock of the ore-bearing zone is a white marble. Slate and igneous rock—the dikes of diorite and porphyry—occur also within the ore-bearing zone, but the orebodies that have been worked are inclosed principally in the marble. The rocks of the ore-bearing zone strike in a north to northwesterly direction, and dip on the average 70° S.W.; the orebodies conforming to the trend of the inclosing rocks. The lead orebodies formerly worked were from 3 to 20 feet wide, and about 70 feet in length. The ore consists largely of galena, cerussite, anglesite; also some sphalerite, tetrahedrite and pyrite. The San Felipe vein cuts diagonally across the silver-lead ore-bearing zone, trending

Belshaw Shaft, Cerro Gordo Mines, Inyo County.

N. 35° W., and dipping 70° to 80° S.W. It traverses both marble and porphyry, and is about 12 inches to 2 feet in thickness. The main ore mineral noted is tetrahedrite, with its oxidation products, azurite and malachite inclosed in a gangue of barite and quartz.

The ore now mined is worked through the Belshaw shaft, 900 feet deep, with levels at 200', 400', 500', 700', and 900'. A winze is being sunk from the 900-foot level, 160 feet north of the Belshaw shaft. At a depth of 100 feet (1000-foot level), a crosscut has been driven west 30 feet, cutting a vein of quartz 2 to 6 feet wide, which strikes N. 35° W. and dips 70° to 80° S.W. The quartz is mineralized with tetrahedrite, galena, azurite, and malachite.

The ore mined is said to assay 25 ozs. silver, $1\frac{1}{2}\%$ to $2\frac{1}{2}\%$ lead, and $2\frac{1}{2}\%$ copper. This vein lies about 250 feet south of the San Felipe vein, and has a course parallel to it. The vein has been drifted for a distance of 100 feet. The present company plans to sink the winze to a depth of 250 feet below the 900-foot level. On the 1000-foot level a

drift has been driven southeast several hundred feet, developing a lens of lead carbonate ore. The 400-foot level, in the vicinity of the China stope, has been subleased to Cooper Shapley and B. S. Hook of Bishop, who have also a lease on the Cerro Gordo mill. The fills of the old stopes are being drawn and the fines are to be treated in the mill at Keeler. The ore is stated to assay 13% lead, 7 ozs. silver, $1\frac{1}{2}$ % copper, and 50 cents in gold. From concentration test it is stated a product assaying 45% lead and 60 ozs. silver can be produced with a recovery of 60% of the lead and silver. The company is shipping 150 tons of ore per month. The siliceous ore from the 1000-foot level is shipped to the Mammoth Copper Company's smelter at Kennett, Shasta County. Freight on this ore from Keeler to Kennett costs \$3.90 per ton. The lead ore is shipped to the Midvale Smelter, Utah.

Limestone is being mined through the Union tunnel, and 80 tons per day are transported over a tramway to bunkers at Keeler, from which it is loaded in railroad cars and hauled to the plant of the Natural Soda Products Company.

Mine equipment: Single drum hoist driven by 100-h.p. motor; 1 Ingersoll-Rand compressor (16" x 12") (9" x 12") driven by 75-h.p. motor; 1 Ingersoll-Rand compressor (21" x 16") (12" x 16") driven by 100-h.p. motor. A Leschen aerial tramway 29,560 feet long carries ore and limestone to bunkers on the railroad at Keeler. Capacity of tramway is 16 tons per hour. Electric power is furnished by the Southern Sierras Power Company.

Mill equipment: 9" x 15" Blake crusher, No. 54 Marey mill in closed circuit with Dorr duplex classifier, elevators, 1 Colorado impact screen, 1 Burchart concentrator, and 3 Wilfley concentrators. Mill driven by 50-h.p. motor. Forty men employed.

Bibl: U. S. Geol. Survey Bull. No. 540, pp. 97-109; Professional Paper 110, pp. 106-116; State Mineralogist Report XV. pp. 90-92.

Estelle Group of Mines, Cerro Gordo district, is five miles east of Keeler on the western slope of Cerro Gordo Mountain. Holdings comprise 11 claims. Elevation 6100 feet. Owner, *Estelle Mining Company*; Adolph Ramish, president; Roy C. Troeger, secretary; Thomas L. Chapman, general manager. Offices, Keeler, Cal.

Since the publication of Report XVII of the State Mineralogist (1920), the energies of the company have been devoted to driving the Dellaphene tunnel, which has been driven N. 60° E. 9000 feet, intersecting the vein on the Morning Star claim at a depth of 1700 feet, and also said to have cut the San Felipe vein developed in the Cerro Gordo Mine, at depth of 2400 feet below the Cerro Gordo Mine. The tunnel intersects carboniferous rocks consisting mainly of limestone. At 5929 feet from the portal, a drift has been driven southeast 900 feet along a fault fracture, which is evidently a post-mineral fault as no ore was developed. Near the face of this drift a crosscut is being driven southwest to cut the Morning Star vein. At 6772 feet from the portal a drift has been driven southeast 800 feet on a fault fissure; a small lens of lead carbonate and galena ore being developed. Average width of ore 18 inches. At 7676 feet from the portal it cut the San Felipe vein. Drifts have been driven on this vein 300 feet northwest,

and 300 feet to the southeast. The vein strikes N. 35° W. and dips 70° to 80° S.W. It traverses the limestone and ranges from 18" to 4 feet wide. The gangue is quartz mineralized with galena and pyrite, occasionally with tetrahedrite.

In a drift to the north from the main crosscut tunnel, which is located 100 feet west of the San Felipe vein, a 3-compartment raise has been put up in the limestone a distance of 200 feet. At 40 feet it cut a small lens of lead carbonate and galena ore and at 160 feet cut another lens of ore 20 feet long and 12 feet wide. Other orebodies have been developed in the limestone east of the San Felipe vein. This indicates that the silver-lead ore-bearing zone has been cut by the San Felipe vein and probably occurs in the limestone about 100 feet east and west of the San Felipe vein. These orebodies consist of lenticular masses of lead carbonate, the ore being inclosed in marbleized limestone. The ore is principally reddish yellow lead carbonate and galena,

Troeger Tunnel, Estelle Group of Mines, Cerro Gordo District, Inyo County.

said to carry 30 ozs. silver, and 30% lead. These orebodies occur on or near the intersections of north-south and east-west fissures on bedding planes of limestone, which dip 25° to 35° east. Ore mined is trammed in twelve 25-cubic-foot ore-cars hauled by an electric storage battery locomotive to ore-bins at the mouth of the tunnel, where it is sorted, then hauled by trucks to Keeler. Ore shipments to the smelter at Midvale, Utah, average 250 tons per month.

The *Morning Star Mine*, owned by the company, is under lease to Harry Hildeman of Keeler. The Morning Star workings are situated at an elevation of 8000 feet.

Developments: Consist of crosscut tunnel driven N. 40° E. 450 feet where it cut a lead-silver ore-bearing zone in limestone. A winze was sunk on ore to a depth of 225 feet, with levels at 40', 70', 120', and 220'. The ore-bearing fissure strikes N. 30° W., dipping 75° S.W. Galena and carbonate ore is being mined, carrying 30 ozs. silver, 10%

to 12% lead and some gold values. Five men are employed on the Morning Star lease.

Equipment: Ingersoll-Rand compressor (17" x 14") (10" x 14") driven by 100-h.p. motor, Root's No. 8 pressure blower driven by 25-h.p. motor, fifteen 25-cubic-foot ore cars, aerial tramway 7000 feet in length from the Morning Star Mine to ore bunkers below the Della-phene tunnel, storage battery locomotive, blacksmith shop, assay office, and buildings for employees. Electric power is supplied by the Southern Sierras Power Company. Twenty men are employed.

Bibl: U. S. Geol. Survey Bull. No. 540, p. 110; State Mineralogist Report XVII, p. 286.

Lucky Jim Mine (lead-silver). Situated in the Darwin district, two miles north of Darwin, and twenty-four miles southeast of Keeler. Owners, *Darwin Silver Company*, Chicago, Illinois. The mine is under lease to A. G. Kirby of Darwin, Cal. The ore mined from the Lucky Jim is being concentrated in a mill on the property. Fifteen men are employed.

Bibl: Mineral Resources West of Rocky Mountains, 1876, p. 25; Report of Director of Mint, Precious Metals in U. S. 1883, p. 163; State Mineralogist Reports VIII, p. 226; X, p. 211; XII, p. 24; XV, pp. 100-101; XVII, pp. 289-290; U. S. Geol. Survey Bull. No. 580, pp. 12, 18.

Santa Rosa Mine (lead-silver) is located in the Lee Mining district, east of Cerro Gordo, and twenty-six miles by road from Keeler. Elevation 7000 feet. Owner, *Independent Lead-Silver Mining Company*, Syndicate Building, Oakland, Cal. Under lease to Scruggs & Yake, Howard & Wilson, and Joe La Cyr of Keeler.

The country rock is limestone intruded by dioritic-porphry dikes. The ore occurs on the contact of limestone with diorite intrusions, and is composed of galena and lead carbonate, carrying values in silver. Six cars of ore were shipped during the month of April to the Midvale Smelter, Utah. Eight men are employed.

Bibl: State Mineralogist Reports XV, pp. 107-108; XVII, p. 294.

MARBLE.

Inyo Marble Company, D. H. Dunn, president; Robert H. Tune, secretary; offices 1014 Hibernian Building, Los Angeles. The property of the company is located six miles north of Keeler, on the southwestern flank of the Inyo Range of Mountains. Two quarries are under operation. The company is supplying the Inyo Chemical Company with dolomite. Six men are employed.

Bibl: State Mineralogist Reports X, p. 215; XII, p. 392; XIII, p. 628; XV, p. 111; XVII, p. 295; State Mining Bureau Bull. 38, pp. 99-100.

POTASH AND SODA.

Inyo Chemical Company of Detroit, Michigan, on May 1, 1924, purchased the plant of the *California Alkali Company*, which is situated at Cartago, a station on Owenyo branch of the Southern Pacific Rail-

road. The plant is located on the western shore of Owens Lake. Officers of the present company are H. W. Carr, president; W. H. Lowery, plant superintendent. Pacific coast office, 910 Santa Fe Building, San Francisco.

This plant has been idle since 1922, and the present company plans to remodel and increase its capacity. Due to Owens Lake drying up, a pipe line eight miles in length and pump will have to be installed to pump brine to the vats for solar evaporation. The concentrated brine will be treated in the plant for extraction of potash, borax, sodium carbonate (soda ash), sodium bicarbonate, and crude trona. The plant is expected to treat 600 tons per day of brine, producing 200 tons of dry salt. The company also owns the *Deep Springs Lake deposit*, Inyo County. One hundred men are employed

Bibl: State Mineralogist Report XVII, p. 298.

Inyo Chemical Company's Plant (formerly California Alkali Company), at Cartago, Owens Lake, Inyo County.

Inyo Development Company. This plant is situated one mile northwest of Keeler, on the eastern shore of Owens Lake. The plant was purchased in 1923 by the *Great Western Chemical Company*, Pittsburg, Cal. Idle.

Bibl: State Mineralogist Reports VIII, p. 226; XII, p. 409; XIII, p. 646; XV, pp. 124-125; XVII, p. 299.

Natural Soda Products Company. Plant situated on the east shore of Owens Lake, two miles south of Keeler. Owners, *Natural Soda Products Company*; W. W. Waterson, president; J. S. Henderson, secretary; Paul Waterson, superintendent, Keeler, California.

Since the publication of Report XVII of the State Mineralogist (1920), the plant has been under continuous operation. The company is producing sodium bicarbonate, sodium carbonate (soda ash), and crude trona (a double salt of sodium carbonate and sodium bicarbonate.) Limestone is secured from the Cerro Gordo Mine, for the

generation of carbon dioxide, replacing dolomite formerly secured from the Inyo Marble Company. The burned lime is being sold by the company as a by-product. One hundred men are employed.

TALC.

Inyo Talc Company, P. H. Booth, president; Franklin Booth, secretary; offices, Equitable Bank Building, Los Angeles. Operating *Simens Talc Mine*, and also grinding plant. The mine is located seventeen miles southeast of Keeler, while the grinding plant is at Keeler.

Bibl: State Mineralogist Reports XV, pp. 126-127; XVII, pp. 300-301.

TUNGSTEN.

Pine Creek Tungsten Mine. Situated forty-five miles by road northwest of Laws, on the south slope of Mount Morgan, in the Sierra Nevada Range. Elevation 11,200 feet. The property was recently taken over under lease by the *Tungsten Products Company*; W. W. Waterson, president; E. Cooper Shapley, secretary and manager. At present writing the mine and mill are being put in shape for operation. Thirty men are employed.

Kern County.

GOLD.

King Solomon Consolidated Mines consist of 90 acres in Sec. 35, T. 29 S., R. 40 E., three-fourths of a mile west of Johannesburg, in the Rand district. Owners, *Shipsey Mining Company*, of Los Angeles. Edward Shipsey, president; Thos. D. Nestor, secretary; Ray Drain, superintendent. Elevation 3900 feet.

The vein strikes northwest and southeast. Width 3 feet. Granite footwall and porphyry hanging wall.

Developments consist of shaft 520 feet deep, with levels every 50 feet. Present development work confined to the 300-foot level.

Equipment consists of 25-h.p. electric hoist and 5-stamp mill.

Ore mined from the 300-foot level is reported to assay \$50 per ton, and during the month of April 100 tons were treated in the mill. Six men are employed.

LIMESTONE.

Kramer Limestone Deposit is located in T. 8 N., R. 20 W., about six miles west of Chandler, a station on the Ridge Route. Elevation 5300 feet. Owner, *Henry Kramer*, La Crescenta, Cal. Holdings comprise 3 claims; 60 acres.

A massive belt of limestone is exposed on the ridge northeast of Cuddy Canyon, the general strike being northwest and southeast, with a dip to the northeast. The limestone is exposed for a distance of 4500 feet in length and about 300 feet in width. The material is white and crystalline. Analysis reported as 96% CaCO_3 . Idle.

Riverside County.

EAGLE MOUNTAIN DISTRICT.

Iron Chief Mine (gold). Situated in the northern part of Eagle Mountains, forty miles northeast of Mecca, a station on the Southern

Pacific Railroad. Elevation 2500 feet. Owner, *Southern Pacific Railroad Company*. Holdings comprise six patented claims known as the *Gray Eagle Group*.

The property was originally located by William Stevens and Thomas Dolflemeyer of San Bernardino. In 1897 the mine was sold to Mr. Charles Lane of San Francisco, who installed a small mill on the property and operated it for several years. The ore milled is said to have had a value of \$40 per ton, of which about 50 per cent was recovered. It is stated that the production was \$50,000. Mr. Lane did not complete payments on the property and the original owners then installed a 50-ton cyanide plant, operating the mine and mill until about 1902, when sulphide ore was encountered and operations were suspended. The ore milled is said to have had an average value of \$10 gold per ton. The production is reported to have been \$150,000.

The ore is largely hematite which carries free gold. It occurs as a

Iron Chief Gold Mine. View of Dumps and Cyanide Plant, Eagle Mountains, Riverside County.

replacement along the contact of dolomite and quartz-monzonite. This contact strikes N. 70° W., dipping 50° N.

Developments: Consist of vertical shaft 140 feet deep. About 500 feet west of the shaft a tunnel has been driven east 1000 feet along the contact, cutting the vertical shaft at a depth of 100 feet. On the north slope of the hill, a crosscut tunnel has been driven south 500 feet to the contact. The ore cut in these lower workings was heavy pyrite ore, with some chalcopyrite. Only the oxidized ore above this level was worked. The ore along the contact fissure had a width of from 2 to 10 feet.

Mine equipment: 25-h.p. Foos gas engine.

Mill equipment: Two Blake crushers, Gates rolls, eight 4' x 18' steel cyanide tanks.

Water was secured from Cottonwood Springs, situated eighteen miles south of the mine. Idle.

Black Eagle Mine (lead, silver, copper, gold). Situated in the northern part of the Eagle Mountains, forty-seven miles northeast of Mecca, a station on the Southern Pacific Railroad. Elevation 2100 feet.

Cottonwood Springs, Eagle Mountains, Riverside County.

Owner, *Edward Harmon* of San Bernardino, California. Under option to A. W. Scott and George Hayden of Los Angeles. The property comprises three unpatented claims known as Maleta No. 1, No. 2, and No. 3. Area 60 acres.

Compressor Plant and Dumps at Black Eagle Mine, Eagle Mountains, Riverside County.

The Black Eagle vein courses through the center of Maleta No. 1 and No. 2 claims, its strike being N. 70° W., with a dip of 85° to the north. At approximately the middle of Maleta No. 2, the vein inter-

sects a cross vein which has been formed along a fault fracture. The intersection of these two veins show a mineralized fracture at least 15 feet in width. The Black Eagle vein occurs along the contact of quartzite and diorite, forming a contact fissure. Several hundred feet north of the diorite and running parallel to it are strata of dolomitic

Portal of Tunnel, showing outcrop of vein.
Black Eagle Mine, Eagle Mountains, Riverside County.

limestone, which in many places are replaced by iron oxide, mainly hematite.

Development: The present development is on Maleta No. 1. On this claim an adit tunnel has been driven N. 70° W. for a length of 255 feet. At a distance of 162 feet, a winze has been sunk to a depth of

100 feet. From the bottom of the winze, drifts have been run 40 feet east and 100 feet west. The adit tunnel was driven along the hanging wall of the vein for a distance of 196 feet, where it cut into the vein at what is known as Stope No. 3, and then continued along the vein to the face of the tunnel. The orebody, as exposed by these workings,

Mixed Iron Ore and crystalline Dolomite in canyon northwest of Black Eagle Mine. Iron Chief Mine, Eagle Mountains, Riverside County.

is 150 feet long, with an average width of 4 feet, and is stated to have an average value of \$21 per ton in gold, silver, lead, and copper. The vein varies from 3 to 9 feet in width. The ore occurs in lenticular form in the vein. The vein filling is quartz, mineralized with galena, malachite, azurite, cuprite, anglesite, cerrusite, cupro-plumbite, and lead vanadate.

Three carloads of sorted ore have been shipped from the property to the Selby Smelting Works. Average gross value of shipments was \$65 per ton. Smelter assay returns on ore: Au, 0.53 ozs.; Ag, 16 ozs.; Pb, 23.3%; Cu, 5.7%.

Equipment: 25-h.p. Fairbanks-Morse, style H gas engine driving 9" x 8" Ingersoll-Rand compressor, 3-h.p. Fairbanks-Morse gas engine driving No. 4 Buffalo blower; 1 Tugger hoist, two auto trucks.

Water is hauled from Cottonwood Springs in a 450-gallon tank. Six men are employed.

IRON.

Iron Chief Mine. The Eagle Mountain iron ores are located in the northern part of the Eagle Mountains, northern Riverside County. They are forty miles northeast of Mecca, a station on the Southern Pacific Railroad.

The deposits extend over an area about eight miles long and from a quarter of a mile to two miles wide, running across the summit of the Eagle Mountains in a general east-west direction. The area in which iron ores occur is in T. 3 S., R. 14 E. Holdings comprise 187 patented claims, owned by the *Iron Chief Mining Company*, which company is controlled by the *Southern Pacific Railroad Company*.

The iron ores with associated metamorphic minerals occur as replacements in the dolomite which is found in beds and lenses at two principal horizons in the dolomite and quartzite series. The trend of the iron-bearing belt is approximately N. 70° W. Width of outcrops varies from a few feet to 500 feet. The largest body of mixed ore and gangue material exposed is 6000 feet in length and has a maximum width of outcrop of 500 feet. The ore is predominantly hematite, but here and there consists of magnetite. A considerable percentage is very pure and of high grade, containing between 62% and 67% metallic iron and less than 0.06% phosphorus. E. C. Harder, in Bulletin No. 503 of the U. S. Geological Survey, estimates tonnage at from 40,000,000 to 70,000,000 tons. The iron ore deposits of the Eagle Mountains are fully described in that bulletin.

The only development work noted on the iron deposits, consists of a large number of shallow shafts and tunnels on the different claims. Owing to the limited amount of time at my disposal, only the most prominent outcrops in the neighborhood of the Iron Chief and Black Eagle mines were visited.

Water from Cottonwood Springs was originally piped into the deposits, near the Iron Chief Mine, a distance of eighteen miles.

San Bernardino County.

GOLD.

Mabel, Contention, and Investment Group of Mines. Comprises 12 claims located in the Arrow mining district, twenty-three miles northwest of Fenner, on the eastern slope of the Providence Range of mountains. Elevation 3750 feet. Owner, *Thomas A. Gannon*, Fenner, Cal. Since publication of Report XVII of the State Mineralogist (1920), considerable development has been done on the different claims by Mr.

Gannon and associates of Los Angeles. This work is being confined mainly to the Contention, Mabel and Subway claims.

Developments: The Contention shaft has been sunk on a vein which strikes east and west, with dip 65° S. The vein varies in width from 12 inches to 4 feet. At a depth of 100 feet sulphide ore appears. The

View of Dike and Mill. Mabel-Contention Mines, Providence Mountains, San Bernardino County.

principal production came from ore in the oxidized zone above the 100-foot level. It is stated that sorted ore shipped had a value of \$100 per ton. The principal development has been on the 200-foot level, where the vein has been drifted on about 340 feet. Estimated tonnage of ore on dump is 6000 tons, and it is said to assay \$5 per ton in gold.

The drift on the 50-foot level of the Subway shaft is being extended north to intersect the workings from the Contention shaft. Approximately 2500 feet north of the Contention shaft, are two shafts known as Mabel No. 1 and No. 2. The vein here strikes N. 20° E., and dips 70° W. Mabel No. 1 shaft is 140 feet deep. Mabel No. 2 shaft is 40 feet deep. The vein exposed in these workings varies in width from 2 to 9 feet. The distance between the two shafts is 750 feet. Ore extracted from these workings is said to have milled \$35 per ton. Ore shipped to smelter from these workings is stated to carry over \$100 per ton. Two men are employed.

Bibl: State Mineralogist Report XVII, p. 349.

Bonanza King Mine (silver). In the Trojan mining district. It is situated on the eastern slope of the Providence Range of mountains, twenty-five miles east of Fenner, a station on the Santa Fe Railroad.

Bonanza King Mine. Providence Mountains, San Bernardino County.

Elevation 4200 feet. Holdings comprise 12 claims. Owners, *Hall, Rawitser and Company*, Acton, Massachusetts. Property taken over under lease and bond during 1923 by the Bonanza King Consolidated Mines Company. O. B. Bachman, president; Wade Hampton Williams, vice president; A. E. Kinney, secretary.

Ore bodies occur along a series of parallel north-south fissures in carboniferous limestone. The fissures are near the contact of limestone and monzonite, and run parallel to the contact. The ore occurs as chloride of silver, and chloro-bromide of silver, with a small percentage of galena.

Present development work is confined to the 3d, 4th, 5th, and 6th levels, where some lenses of ore have been exposed. One car of ore was extracted during May 1924. The present company plans to unwater the winze from the 600-foot level, which is 200 feet deep. Six men are employed. For detailed description of the property see State Mineralogist Report XVII, pp. 360-361.

Buena Vista Group (lead, copper, gold). Comprises 4 claims located in the Arrow Mining District, twenty-two miles northwest of Fenner, in the Providence range of mountains. Owner, *Thomas J. Fitzsimmons*, Hollywood, Cal.

A series of parallel quartz veins in granite and schist strike north-south and dip 40° to 60° W. Widths vary from 2 inches to 2 feet. The quartz is iron stained and carries values in copper, gold and lead.

Developments consist of a number of shallow shafts and open cuts. Only yearly assessment work is done on the property. Idle.

Lead Mountain Mine. Located in the Grapevine mining district, five miles northwest of Yermo. Holdings consist of 640 acres, patented, in Sec. 36, T. 10 N., R. 1 W. Owner, *Western Smelters and Supply Company*. Lewis I. Buck, president; S. A. Court, Secretary. Offices, 503 Chamber of Commerce Building, Los Angeles.

The country rock is tufa, limestone, and andesitic porphyry. The

Lead Mountain Mine. Yermo, San Bernardino County.

ore-bearing fissure strikes northwest-southeast and dips 40° N.E. Width of ore zone is about 100 feet, the orebodies occurring irregularly throughout this area, which has been proved for a distance of 1300 feet along the strike of the fissure. The vein material is a coarsely crystallized baryta with quartz containing brown iron oxides, lead carbonate, ochre, manganese oxide, and silver chlorides. The ore is said to assay: Ag, 6 to 30 ozs.; Au, \$0.40 to \$2.00; Pb, 15% to 30%.

Developments: The principal workings which are on the south slope of Lead Mountain, consist of a series of open cuts and tunnels along the strike of the ore zone for a distance of 500 feet. The present work is confined to a tunnel which is driven north 75 feet, crosscutting the ore fissure. On this level drifts have been run northwest about 100 feet in the center of the orebody, with some stoping above the level.

Near the portal of the crosscut tunnel, a shaft has been sunk on an incline of 33° for 210 feet. At this point there is a stope 25 feet wide by 50 feet long and 30 feet high. The ore mined is galena and lead

carbonate. This ore occurred along a N. 20° W. fracture. From the floor of the stope there is a vertical winze 240 feet deep which connects with a crosscut tunnel 1300 feet in length, driven from the north side of Lead Mountain.

Equipment: 15-h.p. hoist, cars, and Packard truck. Six men are employed.

OIL FIELD DEVELOPMENT OPERATIONS.

By R. D. Bush, State Oil and Gas Supervisor.

FEATURES OF PRODUCTION, FIRST HALF OF 1924.

The production of oil in California for the first half of 1924 was 118,113,000 barrels as compared with 146,338,069 barrels for the last half of 1923, a decrease of 28,225,000 barrels. The average daily production at the first of 1924 was 700,300 barrels declining to 619,500 barrels on July 1 and shows a steady but gradual decline from the peak of production which occurred during the fall of 1923.

While the production decline of the State has been gradual the decline of the three prolific fields, Santa Fe Springs, Long Beach and Huntington Beach, which produced a large proportion of the oil, has been rather precipitous, but this was offset by additional development of good wells in the Torrance Field, discovery of the Dominguez Field with its large producers, extension of the eastern edge Buena Vista Hills, Kern County, into highly productive territory, and the resumption of closed in production in the older fields of the state.

Consumption also declined and more rapidly than production with the result that storage increased from about 92,000,000 barrels on January 1, 1924, to about 100,000,000 barrels at the end of June. The unexpected decrease in consumption was due to various causes, among them being decreased demand for fuel oil by the largest consumers, the railroads, decreased demand for gasoline resulting from the hoof and mouth disease in California, decreased demand for gasoline east of the Rocky Mountains due to weather conditions and to the continued over-production of oil in the Mid-Continent fields. The last two factors no doubt account for the fact that the export of California oil to eastern and gulf ports was 6,728,000 barrels less during the first half of 1924 than during the previous six months. This amount accounts for practically all the storage increase in the state during the first half of this year.

The total proved oil land of the state as of March 1, 1924, was 116,868 acres, an increase of 4107 acres over the previous year as determined by the State Oil and Gas Supervisor.

The estimated cost of maintaining the Department of Petroleum and Gas for the fiscal year 1923-1924 was \$135,917.17. Therefore in order to renew the Petroleum and Gas fund to the maximum of \$185,000 allowable by the statute under which the Department functions, oil and gas producers and oil land owners will be subject to a tax, prorated against oil and gas produced during 1923 and proved oil land to bring in a total amount of \$135,917.17.

In prorating the assessment one-tenth of the total amount is assessed against the proved oil land and the remaining nine-tenths is levied against the oil produced and sold, as determined from sworn statements of oil and gas producers. For the purpose of assessment ten thousand cubic feet of gas is equivalent to one barrel of oil.

The total production of net oil in 1923 according to sworn statements was 259,882,565 barrels. The total quantity of gas produced and sold was 115,682,200,000 cubic feet. The rate per barrel of oil and per ten thousand cubic feet of gas is \$.00045063 to yield a total of \$122,325.46.

OIL FIELD DEVELOPMENT OPERATIONS.

From April 12, 1924, to and including July 5, 1924, the following new wells were reported as ready to drill:

SPECIAL ARTICLES.

Detailed technical reports on special subjects, the result of research work or extended field investigations, will continue to be issued as separate bulletins by the Bureau, as has been the custom in the past.

Shorter and less elaborate technical papers and articles by members of the staff and others are published in each number of 'Mining in California.'

It is anticipated that these special articles will cover a wide range of subjects both of historical and current interest; descriptions of new processes, or metallurgical and industrial plants, new mineral occurrences, and interesting geological formations, as well as articles intended to supply practical and timely information on the problems of the prospector and miner, such as the text of new laws and official regulations and notices affecting the mineral industry.

OIL AND GAS RIGHTS.

By A. H. RICKETTS, of the bar of the Supreme Court of the United States, of California and of Nevada.

Copyright, 1924, by A. H. Ricketts.

PART III.

WITHDRAWALS—PICKETT ACT—FEDERAL WATER POWER ACT—RECLAMATION PROJECTS.

- | | |
|--|---------------------------------------|
| § 1. The President's Withdrawal Order. | § 6. Reclamation Projects. |
| § 2. Power of the President. | § 7. Mineral Lands Withdrawn. |
| § 3. The Pickett Act. | § 8. Default in Assessment Work. |
| § 4. Act of August 25, 1914. | § 9. Jurisdiction of Land Department. |
| § 5. Federal Water Power Act. | |

§ 1. The President's Withdrawal Order.

The President's withdrawal order of September 27, 1909, "in aid of proposed legislation" withdrawing oil lands in California and Wyoming from entry or disposal under the mineral laws did not withdraw such lands from the right to enter, locate nor purchase merely. Its manifest object, as the language plainly shows, was to preserve the petroleum in the lands in order to subserve the public interest. Its purpose was to withdraw such lands from the right to explore for oil or to extract and dispose of the same. The lands are valuable only for their mineral contents and the express purpose of the withdrawal order was to preserve such contents until Congress should provide for their disposition and when withdrawn the lands ceased to be public lands within the meaning of the mining law and hence not open for exploration nor discovery under such laws.¹ Such withdrawal order is ineffectual as against a title previously acquired.²

¹ U. S. vs. Midway Northern Oil Co., 232 Fed. 627. This withdrawal was confirmed in executive order of July 2, 1910, creating Petroleum Reserve No. 2, which said reservation was made subject to all the provisions, limitations, exceptions and conditions of the Pickett Act, *infra*, § 3. Interstate Oil Corp., 50 L. D. 262.

A petroleum withdrawal prior to the Leasing Act of unproved lands for the purpose of classification, was not extinguished by the passage of that act, inasmuch as the prospecting for oil and gas thereunder was intended merely as preliminary to leasing and not as a method of disposal, they being only subject to lease upon discovery of their value for mineral deposits. Utah vs. Lichliter (on reconsideration), 50 L. D. 231.

Lands within the forfeited grant to a railroad company that have been classed as "power site lands" under the authority of the act of June 9, 1916 (39 Stat. 218), and

§2. Power of the President.

The power of the President to make withdrawal orders was upheld by the Supreme Court of the United States³ and authorized by the "Pickett Act."⁴

§3. The Pickett Act.

The act of June 25, 1910, did not in any way affect the Presidential withdrawal order of September 27, 1909.⁵ It authorized withdrawals "for water power sites, irrigation, classification of lands or other public purposes to be specified in the orders of withdrawal." This act was amended on August 24, 1912,⁶ so as to include nonmetalliferous minerals and provided that it should not be construed as a repudiation, abridg-

included within a power site reserve by Executive order issued pursuant to the Pickett Act, are open to exploration, discovery, and purchase under the mining laws only so far as those laws apply to metalliferous minerals. Dailey Clay Co., 48 L. D. 429.

² Stockley vs. U. S., 260 U. S. 532; N. P. R. Co. vs. Mitchell, 208 Fed. 469; Knudsen vs. Omanson, 10 Utah 124, 37 Pac. 250. As to state selections see Wyoming vs. U. S., 255 U. S. 489. It was not the intention of the President acting for and on behalf of his principal, the United States government, to except from the operation of the withdrawal order all claims or locations that might then be subsisting upon lands included within the order. Special pains were taken to indicate that the intention of the President was that only valid locations or claims were to be excepted from the general operation of the withdrawal order. The effect of the withdrawal order depends upon what is meant by a valid location or claim. Under the mining laws the locator has no vested right as against the government until he makes a discovery of oil upon his claim. The posting or recording of his oil placer claim gives him no rights as against the United States until by discovery of oil it is made apparent that the land in truth and in fact is mineral land and subject to location under the mining law. The initiation of his claim by posting notices protects him as against third persons so long as he remains in possession and with due diligence prosecutes his claim toward a discovery. Although this gives him no vested rights against the government yet he has rights which ought to be by all parties respected. All locators who were thus conducting themselves at the time of the withdrawal order had their rights respected by the exception contained therein. If on the date of the withdrawal order any locator then was on any withdrawn lands and was with "due diligence" prosecuting his work toward a discovery of oil, he was not affected by such order, and had a valid location and could proceed to a discovery and thereby perfect his right to the mineral claim. But a locator not in possession or who was not with "due diligence" prosecuting his work toward discovery, was not protected by the order. A person or locator deeming the withdrawal order entirely invalid can not after its date either begin or resume operations looking to the discovery of oil upon his claim, for the reason that the land by reason of such order was no longer open to entry or claim and as between him and the government any subsequent effort of his could not divest the United States of its title. U. S. vs. McCutchen, 234 Fed. 709; see, also, U. S. vs. McCutchen, 217 Fed. 655. For an instance of failure to support the claim of diligent prosecution of work looking to discovery see U. S. vs. Chanslor-Canfield Co., 266 Fed. 143.

It has been decided that a homestead entryman upon withdrawn lands does not acquire the right to an oil well derrick and other fixtures erected by a mineral claimant prospecting for oil under locations made before the withdrawal and before the homestead entry where the mineral claimant has not abandoned his rights and is seeking to maintain them as against the homestead entryman and the government. That the homestead entryman acquires no title to the minerals in the land either by the entry or by the patent issued in pursuance thereof. These are reserved to the government. Hence under the homestead entry no rights are secured to the oil below the surface, nor to the right to prospect therefor. Son vs. Adamson, 188 Cal. 99; 204 Pac. 392; see, also, Midland Oil Co. vs. Rudneck, 188 Cal. 265; 204 Pac. 174.

³ U. S. vs. Midwest Oil Co., 236 U. S. 459; Pickett vs. U. S., *supra* (2). A withdrawal order promulgated by the Secretary of the Interior is deemed the act of the President. Stockley vs. U. S., 171 Fed. 632.

⁴ U. S. Comp. St. p. 5320, § 4523.

⁵ See § 1, *supra*.

⁶ U. S. Comp. St. p. 5320, § 4523, amended, Id. p. 5321, § 4524. See act of January 26, 1921, Fed. Stats. Anno. 1921, p. 268. The Pickett Act is the first legislative recognition by Congress of a statutory right in an occupant of public oil lands prior to discovery. It was manifestly intended to and does expressly give to those coming within its provisions a legal status and a right to continue work of discovery with the attendant consequences. Its purpose was to protect *bona fide* occupants of public oil or gas lands who in good faith were, at the date of the withdrawal, engaged in work leading to discovery, by giving them the right to continue their work to a discovery, and thereafter to extract and market the oil, and to acquire title notwithstanding the withdrawal. U. S. vs. Rock Oil Co., 257 Fed. 333. The term "metalliferous minerals" in the Pickett Act was used to describe those minerals or ores of economic value from which the useful metals can be directly and advantageously extracted. Con. Ores Co., 46 L. D. 468. The right of withdrawal exists in the President without special authorization from congress. Stockley vs. U. S., *supra* (3).

ment, or enlargement of any asserted rights or claims initiated upon any oil- or gas-bearing lands after any withdrawal of such lands prior to the passage of the act. The statute did not indicate an intention to nullify or affect the validity of previous orders withdrawing oil- or gas-bearing lands, but shows an intention on the part of Congress to regulate withdrawals after its passage and to grant relief to those who were in diligent prosecution of work leading to the discovery of oil or gas at the date of the previous withdrawal. There is nothing to indicate the slightest intention to nullify, cancel, or repudiate withdrawals of oil- or gas-bearing lands already made. It is remedial in its nature and should be liberally construed.⁷

§ 4. Act of August 25, 1914.

This law⁸ was amendatory of the act of March 2, 1911,⁹ and provided for working reserved lands prior to the issuance of patents therefor and the disposal of the proceeds thereof.

§ 5. Federal Water Power Act.

The Federal Water Power Act of June 10, 1920,¹⁰ sought to provide for the development of water power and the use of the public lands in relation thereto and granted certain limited authority to the Federal Power Commission, which, under the law, is charged with the adminis-

⁷ U. S. vs. Midway Northern Oil Co., *supra* (1); U. S. vs. Standard Oil Co., 265 Fed. 762; see, also, U. S. vs. Ohio Oil Co., 240 Fed. 1005; U. S. vs. Stockton Midway Oil Co., 240 Fed. 1009. A withdrawal under this act is, in its nature, a continuing withdrawal which, although not attaching to land that at date of withdrawal was within a valid subsisting location, attaches immediately upon default of the claimant thereafter. This because the provision in § 2324, Revised Statutes (5 U. S. Comp. St. p. 5525, § 4620), declaring that a mining claim upon which the required annual assessment work has not been performed shall be subject to relocation in the same manner as if no location of the same had ever been made, impresses the land in a defaulted claim with the status of public land which as long as it remains in that state may be withdrawn by the government. Interstate Oil Corp. *supra* (1) citing and applying cases of Navajo Ind. Reservation, 30 L. D. 515, and Kinney, 44 L. D. 580. In November, 1908, paper locations were posted by one person in the name of sundry persons claiming the several tracts under the placer mining law, they being at the time vacant, unoccupied mineral lands of the United States. After some transfers and consolidation of claims, the associates entered into a contract with an oil company for the development of one particular property and the oil company under the contract was diligently engaged in work leading to discovery on September 27, 1909, when the land was included in the presidential withdrawal order of that date. Work of development continued after the withdrawal and oil was discovered in December, 1909, involving an expense of a large amount of money. The locations were alleged to be fraudulent and void, because they were made for the purpose of enabling one of the associates to acquire more land within a single location than the law permits. But there could be no reason why the persons succeeding to the rights of the original locators should not be deemed to be *bona fide* occupants at the date of the withdrawal within the meaning of the Pickett Act, where they innocently obtained possession in the first instance from some one who was attempting to acquire more land than the law permitted. Their right was not deraigned from, nor did it depend upon a prior location but upon the terms of the said act. They were occupying and holding in their own right and as persons lawfully entitled to acquire the property under the mining laws. Their possession was not tainted with the fraud of the prior attempted locator whom they did not represent and in whose interest and for whose benefit they were not holding. U. S. vs. Rock Oil Co., 257 Fed. 332. See, also, U. S. vs. North American Oil Co., 242 Fed. 723; Con. Mutual Oil Co. vs. U. S., 245 Fed. 521. Compare U. S. vs. McCutchen, *supra* (2), and 238 Fed. 575.

⁸ 5 U. S. Comp. St. p. 5681, § 4637a. See Estate of Ladd (on rehearing), 48 L. D. 313.

⁹ 5 U. S. Comp. St. p. 5681, § 4637. This act provided that patents for oil and gas lands should not be denied because of transfer prior to discovery of oil or gas therein. See Cole vs. Ralph, 252 U. S. 286. The manifest purpose of this law was to provide a temporary method of operating mining claims embraced in applications for patents and conserving the proceeds until it could be decided whether the lands belonged to the claimants or to the government, without resorting to receivership proceedings. Following this act, the Secretary of the Interior entered into agreements with applicants for patents to land outside the naval reserves and not already in suit, which provide for deposits in escrow of one-eighth of the gross production pending the determination of title.

¹⁰ Supp. Fed. Stats. Ann. 1920, p. 367, amended. Supp. Fed. Stats. 1921, p. 333. This act does not cover the whole subject nor provide a complete system of law displacing

tration of said act. Under the provisions of § 24 of this act any lands of the United States included in any proposed project become reserved from entry, location or other disposal under the laws of the United States, from the date of the filing of the application therefor. If the Commission determines that the value of such lands, reserved or classified as power sites, will not be injured nor destroyed for the purpose of power development by location, entry or selection under the public land laws, the Secretary of the Interior shall declare such lands open to location, entry or selection subject to certain conditions.¹¹

§ 6. Reclamation Projects.

The act of June 17, 1902,¹² known as the Reclamation Act, provides for two forms of withdrawal. The first form of withdrawal is of lands required for the construction of irrigation works.¹³ This is an absolute withdrawal from any kind of entry or mineral location.¹⁴ The second form of withdrawal is of lands under said works and subject to irrigation, which may be entered only under the Homestead laws.¹⁵

§ 7. Mineral Lands Withdrawn.

There is no doubt that lands containing mineral deposits may be withdrawn and reserved from disposal or exploration. It has been so held as to National Monuments,¹⁶ military and Indian reserves,¹⁷ but it is also held in that connection that valid mining locations made prior to such withdrawal are not defeated by such reservation so long as the

all others. 33 Op. A. G. 34. It is evident, however, that congress did not intend that the inclusion of lands in a proposed project or any power site withdrawal or reserve should not be subject to the provisions of the Leasing Act. Oil Prospecting Permits in Power Site Reserves, 48 L. D. 459. See Dailey Clay Co., *supra*.⁽¹⁾

The proviso to § 24 which authorizes the approving or patenting, subject to limitations and conditions of the act, or locations, entries, selections, or filings theretofore made for lands reserved as water power sites, has reference only to such locations, entries, selections, or filings as were made prior to the passage of the act. Wilcox, 48 L. D. 184. The act does not contemplate that reserved lands shall be subject to suspended filings or applications while so reserved. Therefore, as to any public lands covered by the application which are so reserved the application is ineffective and will not be entertained. Walker River District, 48 L. D. 197.

¹¹ An oil and gas prospecting permit or a lease thereon, granted pursuant to the Leasing Act does not constitute an "entry," "location" or other "disposal" of the land included therein, within the meaning of those terms as contemplated by § 24 of the Water Power Act of June 10, 1920. The authority conferred upon the Federal Power Commission by subdivision *h* of § 4 of that act to make rules and regulations not inconsistent with the purposes of the act as may be necessary and proper for the purpose of carrying out its provisions, does not clothe that commission with jurisdiction to require the insertion of restrictions in oil and gas permits and leases consequent thereon pursuant to the Leasing Act, for lands in power site withdrawals and reserves for power purposes. Oil Prospecting Permits in Power Site Reserves, 48 L. D. 459, 628.

¹⁴ See 1 Fed. St. Anno. 414; U. S. vs. Minidoka Co., 190 Fed. 491; Bisbing, 13 L. D. 45; Gabathuler, 15 L. D. 488; Austin, 18 L. D. 4. Lands withdrawn for a reservoir site or similar reclamation purposes which are essential to the project, and lands acquired by purchase or condemnation for the exclusive use of the project, may be developed for their mineral resources only by temporary leases for periods not inconsistent with the needs of the project. Mell, 50 L. D. 308; see, also, Wolfe, 49 L. D. 625, and Clyde vs. Cummings, 35 Utah 461, 101 Pac. 106.

¹⁵ See *supra*, note 13; Bowen vs. Hickey, 53 Cal. A. 256, 200 Pac. 46.

¹⁶ Cameron vs. U. S., 252 U. S. 450, affirming 250 Fed. 943; see Grand Canyon Co. vs. Cameron, 36 L. D. 66. A national monument may be created within the limits of a forest reserve; but, in so far as they both embrace the same land, the monument reserve becomes the dominant reserve. Cameron vs. U. S., *supra*.

¹⁷ Fort Maginnis, 1 L. D. 552; Kinney, 44 L. D. 589; Interstate Oil Corp., *supra*⁽¹⁾; see, also, Grisar vs. McDowell, 6 Wall. 383. Mineral lands within an abandoned military reservation are subject to the mineral laws. See Randolph, 23 L. D. 517. After an Indian reservation has been withdrawn mining locations may be made within its former boundaries. See Collins vs. Bubb, 73 Fed. 735; see, also, Kendall vs. San Juan Co., 9 Colo. 349, 12 Pac. 198, affirmed in 144 U. S. 658.

mineral claimant continues to comply with the law.¹⁸ In other words, a mining location founded on actual discovery of a valuable mineral deposit within the limits of the claim, and maintained in accordance with the mining law and the local regulations applicable thereto, excepts the land covered thereby from the operation of a withdrawal under said act.¹⁹

§ 8. Default in Assessment Work.

A mining claim as to which the claimant was in default in the performance of the required annual assessment work at the date of a withdrawal for the construction of irrigation works under said act does not except the land from the force and effect of the withdrawal.²⁰

§ 9. Jurisdiction of Land Department.

The Land Department holds that it has jurisdiction to determine whether the mining claimant has failed to do the annual assessment work and to declare by its judgment whether the possessory right to a location has been divested so as to restore the land to the government.²¹

PART IV.

SURFACE ACTS.

- | | |
|--|---|
| § 1. Introductory. | § 11. Stock-Raising Homestead Act. |
| § 2. "The Surface Act." | § 12. Mineral Rights Reserved. |
| § 3. Reservation to United States. | § 13. Relative Rights of Miner and Agriculturist. |
| § 4. Prospecting Reserved Deposits. | § 14. Character of Land. |
| § 5. Use of Surface by Miner. | § 15. Timber and Stone Act. |
| § 6. Prompt Consideration of Applications. | § 16. Determination of Character of Land. |
| § 7. Proving Nonmineral Character. | § 17. Oil and Gas Lands. |
| § 8. Restricted Patents. | § 18. Indian Lands. |
| § 9. Jurisdiction of Courts. | |
| § 10. Jurisdiction of Land Department. | |

§ 1. Introductory.

The severance of surface from subsurface rights in land, which an individual proprietor, in its disposal may make as he will, has been authorized by several acts of congress relative to the disposal by the United States of its public domain, among which may be mentioned the act of July 17, 1914, which permitted agricultural entry of the surface rights in withdrawn oil, gas, and other specified mineral lands, and the Leasing Act, which provided for disposal by lease of the subsurface rights separately from the surface ownership, in lands containing certain specified minerals.¹

§ 2. The Surface Act.

The act of July 17, 1914,² called "The Surface Act," did not suspend nor work a repeal of the provisions of the mining laws where such laws could otherwise operate, nor did the act itself effect such a repeal, and no such purpose nor intent can properly be gathered from the language

¹⁸ See preceding note; see, also, *Caledonia Co. vs. Noonan*, 3 Dak. 189, 14 N. W. 426, affirmed in 121 U. S. 393.

¹⁹ Instructions, 32 L. D. 387.

²⁰ See note 17, *supra*.

²¹ *Wyoming*, 33 L. D. 508. Disputes between rival claimants relating to the fulfillment by mining locators, or their successors in interest, of the legal requirements as to performance of annual assessment work are not, generally, matters for departmental determination, but come exclusively within the jurisdiction of the courts. *Corbett*, 50 L. D. 291; see, also, *Cameron vs. U. S.*, *supra*.⁽¹⁶⁾

¹ *Emerald Oil Co.*, 48 L. D. 243.

² 5 U. S. Comp. St. p. 5683, § 4640a.

used. After the passage of this statute, oil, gas or asphaltic minerals (and the other minerals mentioned therein), in the public domain, in areas not covered by Executive withdrawals or reservations, were subject to exploitation and location under the same conditions and with the same facility as theretofore. The specific repeal of the mining laws, as to the mineral deposits mentioned, was accomplished by the Leasing Act. That act, however, expressly provides that valid claims existent at the passage thereof and thereafter maintained in compliance with the laws under which initiated, might be perfected under such laws, even including discovery, under the last-mentioned act.³ These two acts are not in conflict but are the complement of each other.⁴

§ 3. Reservation to United States.

This act provides that the surface lands withdrawn or classified as oil, gas, or asphaltic minerals or which are valuable for those deposits are

³ Pollock, 48 L. D. 5.

⁴ Marathon Oil Co. vs. West, U. S. Intervenor, 48 L. D. 150; Foster vs. Hess, 50 L. D. 276.

In the case of Foster vs. Hess the claim was made that an entryman of lands not withdrawn, classified nor reported as valuable for oil and gas deposits at the time of entry, can only be required to consent to a reservation of such deposits when it is shown, prior to final entry, that the lands contain valuable deposits of oil or gas. In other words, the actual demonstrated existence of minerals is essential; and a reasonable belief that such deposits will be found, based upon geologic indications which would warrant expenditures in prospecting operations, is not sufficient. In the course of the decision it was said: "Analysis of the Acts of July 17, 1914, and February 25, 1920 (the Leasing Act), discloses the fallacy of this claim.

"The act of July 17, 1914 (38 Stat. 509), provided a means whereby surface entries could be made and perfected upon lands 'valuable for' deposits of nitrate, potash, oil, gas or asphaltic minerals; and authorized the issuance of patents to these surface entrymen, which patents should contain a reservation of the particular deposits for which the land was valuable, and reserved to the United States, its lessees or licensees, certain rights in respect to said deposits. It can not be doubted that this act was intended to permit the joint use of mineral lands; and that such rights were reserved from the surface patents as would permit the government, or those in privity with it, to fully exploit and develop the reserved deposits which gave the land value as mineral land.

"Consideration of the rights reserved, therefore, must indicate what the Congress wished to withhold from the surface entrymen and to conserve.

"In each of the three sections of the act of July 17, 1914, the rights reserved are 'to prospect for, mine and remove' the reserved deposits (italics supplied). Lands which, from geologic indications warrant prospecting operations to establish the actual existence of deposits of the minerals specified in the act of July 17, 1914, *supra*, are clearly therefore, to be considered as 'valuable for' such deposits within the meaning of said act; and a report as to such prospective value is a proper basis for a requirement that an entryman of lands having such prospective value consent to a reservation of the particular deposits, in accordance with said act. State of Utah vs. Litchlitter et al. (50 L. D. 231). * * * A second reason for the lack of merit in the foregoing claim appears when the result of said claim, if allowed, is considered. Under that view, only such lands as have been prospected before final entry could be properly classified as mineral. In all other cases, the entryman, by completing final proof, could force the hand of the government and acquire unrestricted title to lands which, from their situation and from their geologic formation strongly suggested the presence of minerals, but which, for some reason not related to the character of the land (such as economic conditions retarding prospecting generally, or especial conditions of isolation, or similar difficulties), had not been prospected and the minerals discovered. The privilege given entrymen in § 2 of the act of July 17, 1914, of proving, before final entry, that the lands 'are in fact non-mineral in character' clearly indicates a contrary intent of the Congress. Any doubt which may have existed on this point prior to the passage of the Leasing Act of February 25, 1920, *supra*, which act is a complement of the act of July 17, 1914, *supra* (Marathon Oil Co. vs. West, U. S. Intervenor, 48 L. D. 150), was dispelled by the provisions of the said Leasing Act. Under § 13 of that act, permits to prospect for oil and gas are authorized as to deposits of said minerals owned by the United States; and in § 20 of said act, surface entrymen of said lands so entered before the lands were withdrawn or classified as mineral, who were thereafter required to consent to accept a restricted or surface patent with the minerals reserved to the United States, are given a preference right to a permit to prospect for oil or gas. When the actual existence of deposits of these minerals are established the entryman is entitled to a lease. No clearer evidence that lands prospectively valuable for oil and gas were intended to be patented under the nonmineral laws only with a reservation of such deposits can well be desired." See, also, California, Robinson, Transferee, 48 L. D. 387; Pace vs. Carstarphen, 50 L. D. 369.

subject to appropriation, location, selection, entry, or purchase, if otherwise available, under the nonmineral laws whenever made with a view of obtaining or passing title with a reservation to the United States of the deposits on account of which the lands were withdrawn or classified or reported as valuable, together with the right to prospect for, mine and remove the same.⁵ Such deposits to be subject to disposal by the government only as shall be expressly directed by law.⁶

§ 4. Prospecting Reserved Deposits.

Any person qualified to acquire the reserved deposits may enter upon said lands with a view of prospecting for the same upon the approval by the Secretary of the Interior of a bond or undertaking to be filed with him as security for the payment of all damages to the crops and improvements on such lands by reason of such prospecting, the measure of any such damage to be fixed by agreement of parties or by a court of competent jurisdiction.⁷

§ 5. Use of Surface by Miner.

Any person who has acquired from the United States the title or the right to mine and remove the reserved deposits, should the United States dispose of the mineral deposits in lands, may reenter and occupy so much of the surface thereof as may be required for all purposes reasonably incident to the mining and removal of the minerals therefrom, and mine and remove such minerals, upon payment of damages caused thereby to the owner of the land, or upon giving a good and sufficient bond or undertaking therefor in an action instituted in any competent court to ascertain and fix said damages.⁸

§ 6. Prompt Consideration of Applications.

Nothing contained in the act shall be held to deny or abridge the right to present and have prompt consideration of applications to locate, select, enter, or purchase, under the land laws of the United States, lands which have been withdrawn or classified as oil gas, or asphaltic mineral lands, with a view of disproving such classification and securing a patent without reservation.⁹

§ 7. Proving Nonmineral Character.

Persons who have located, selected, entered, or purchased lands subsequently withdrawn, or classified as valuable for said mineral deposits, shall not be debarred from the privilege of showing at any time before final entry, purchase, or approval of selection or location, that the lands entered, selected, or located are in fact nonmineral in character.¹⁰

⁵ 5 U. S. Comp. St. p. 5683, § 4640a. Where land within a homestead entry upon which final proof has been submitted, but suspended to await the fulfillment of some further requirement, is discovered to be within the limits of a producing oil field prior to the completion of the proof, the entryman must consent to a reservation of the oil and gas content as prescribed by the act of July 17, 1914, or assume the burden of showing the nonmineral character of the land. *La Flame*, 49 L. D. 324; see *Washburn vs. Lane*, 258 Fed. 524; *Son vs. Adamson*, *supra* ⁽¹²⁾; *Midland Oil Fields Co. vs. Rudneck*, *supra*. ⁽¹²⁾

¹⁰ 5 U. S. Comp. St. p. 5684, § 4640b.

Before issuance of patent the Secretary of the Interior may institute an inquiry upon his own motion, to ascertain whether there was fraud in the entry, and this authority extends to his subordinate, the Commissioner of the General Land Office. *Orchard vs. Alexander*, 157 U. S. 372; *Love vs. Flahive*, 205 U. S. 195; *Jones vs. Hoover*, 144 Fed. 221.

§ 8. Restricted Patents.

Any person who has, in good faith, located, selected, entered, or purchased, or any person who shall hereafter locate, select, enter or purchase, under the nonmineral laws of the United States, any lands which are subsequently withdrawn, classified or reported as being valuable for oil gas, or asphaltic minerals, may, upon application therefor, and making satisfactory proof of compliance with the laws under which such lands are claimed, receive a patent therefor, which patent shall contain a reservation to the United States of all deposits on account of which the lands were withdrawn, classified, or reported as being valuable, together with the right to prospect for, mine, and remove the same.¹¹

§ 9. Jurisdiction of Courts.

The courts, not the Land Department, have direct jurisdiction to determine questions pertaining to actual physical possession of lands in cases arising from conflicts between claimants under the acts of July 17, 1914, and February 25, 1920, respectively.¹²

§ 10. Jurisdiction of Land Department.

The determination of the character of the public lands is committed exclusively to the Land Department, and in exercising that jurisdiction it may select its own instrumentalities and methods. A recommendation of its Geological Survey that specified public lands be withdrawn from entry (nonmineral or other) and placed in a petroleum reserve, if approved by the Department head and acted upon favorably by the Executive, is one mode of classification of those lands as mineral in character; provisional, it is true, and subject to revocation upon further investigation or upon showing by a nonmineral claimant, but until then, presumptively fixing their mineral character. In *Washburn vs. Lane* (*supra*,¹³) it was held that inclusion in a petroleum reserve was a *prima facie* mineral classification, prevailing against a *lieu* selection of the land as nonmineral, previously initiated but not completed.¹³

One who purchases of any entryman before the issuance of patent obtains no greater right or estate than is possessed by the entryman, and acquires at the most a right or equitable estate which is subject to examination within the Land Department while the title remains in the government. *Hawley vs. Diller*, 178 U. S. 488; *Thayer vs. Spratt*, 189 U. S. 352.

¹¹ 5 U. S. Comp. St. p. 5684, § 4640c; U. S. vs. *Ridgely*, 262 Fed. 675; *Stockley vs. U. S.*, *supra*.⁽⁹⁾ Consent to accept a restricted patent in accordance with the act of July 17, 1914, for oil and gas lands, may be filed by a mortgagee, if the homestead entryman, after proper notification, fails to do so. Otherwise the relief to which the former is entitled, would be wholly defeated. *Gordon and Overly Co.*, 50 L. D. 240.

¹² *Marathon Oil Co. vs. West*, U. S. Intervener, *supra*.⁽⁹⁾

¹³ *Mabry* (on rehearing), 48 L. D. 280; see, also, *Lane vs. Cameron*, 45 App. Cas. (D. C.) 409. See, generally, *Cameron vs. U. S.*, 252 U. S. 450; *Burke vs. S. P. R. R. Co.*, 234 U. S. 670; *Vore vs. Ephraim*, 173 Cal. 245, 159 Pac. 719.

The rules of law as administered by courts are binding upon the Land Department only in so far as they are not adverse to but assist its function as an administrative branch of the executive department of the government which, as the proprietor of the public domain, as a party to all proceedings looking to the disposal of any part of that domain, and in its executive administration is entitled to rely upon and adhere to the classification of its lands, once arrived at, even though between others than the parties to a new application to enter. This principle of the paramount nature of the administrative side of the Land Department's work, rather than its function of adjudicating the rights of private claimants, entitles it, in so adjudicating, to respect and follow its own former adjudications as to particular lands, even though not binding in strictness upon a new claimant. Its executive liberty of action in this respect is quite analogous to the executive power, existing through implication of withdrawal of lands from entry notwithstanding congressional legislation had previously made them free and open to occupation and purchase, which is fully discussed in *U. S. vs. Midwest Oil Co.*, *supra*.⁽⁹⁾ *Day*, 50 L. D. 23. The practice of withdrawing lands contemplates their segregation for purposes of investigation and the Land Department holds that it is clearly its duty to seek such withdrawals

§ 11. Stock-raising Homestead Act.

The act of December 29, 1916,¹⁴ called the "Stock-Raising Homestead Act" provides that the Secretary of the Interior may designate unappropriated, unreserved public lands as "stock-raising lands," where the surface thereof is, in his opinion, chiefly valuable for grazing and raising forage crops, provided they do not contain merchantable timber, are not susceptible of irrigation from any known source of water supply, are of such character that 640 acres are reasonably required for the support of a family, and contain no water holes nor other bodies of water needed or used by the public for watering purposes.

Where lands are thus designated, any person qualified to make entry under the homestead laws may make a homestead entry for not exceeding 640 acres thereof, and the fact that the tract sought may be valuable for coal or other minerals is not material, since all minerals are reserved to the United States.

§ 12. Mineral Rights Reserved.

All coal and other mineral rights are reserved to the United States, together with the right to prospect for, mine, remove and dispose of the same.¹⁵

§ 13. Relative Rights of Miner and Agriculturist.

Under the provisions of this law the homesteader does not obtain a title to the fee. His rights are confined to the surface or so much thereof as may not ultimately be set apart for the conduct of mining operations, which, by its terms, do not seem to be limited to the underlying minerals. The miner, under the restrictions shown in note 15 *supra*, may enter

whenever from evidence before it an inference or belief is warranted that lands in fact are mineral. *Utah vs. Litchner, supra.*⁽¹⁾

¹⁴ 39 Stat. 862; amended 40 Stat. 1016; amended 41 Stat. 287. See Instructions, 48 L. D. 485. This act modifies the placer mining laws so as to authorize the issuance of surface patents for lands of the character contemplated by this act and duly entered thereunder, and authorized the patenting of the reserved deposits to mineral applicants under the placer mining laws. *Dean vs. Lusk Royalty Co.*, 50 L. D. 193.

¹⁵ *Id.* Any person qualified to locate and enter the coal or other mineral deposits, or having the right to mine and remove the same under the laws of the United States, shall have the right at all times to enter upon the lands entered or patented, as provided by this act, for the purpose of prospecting for coal or other mineral therein, provided he shall not injure, damage, or destroy the permanent improvements of the entryman or patentee, and shall be liable to and shall compensate the entryman or patentee for all damages to the crops on such lands by reason of such prospecting. Any person who has acquired from the United States the coal or other mineral deposits in any such land, or the right to mine and remove the same, may reenter and occupy so much of the surface thereof as may be required for all purposes reasonably incident to the mining or removal of the coal or other minerals, first, upon securing the written consent or waiver of the homestead entryman or patentee; second, upon payment of the damages to crops or other tangible improvements to the owner thereof; where agreement may be had as to the amount thereof; or third, in lieu of either of the foregoing provisions, upon the execution of a good and sufficient bond or undertaking to the United States for the use and benefit of the entryman or owner of the land, to secure the payment of such damages to the crops or tangible improvements of the entryman or owner, as may be determined and fixed in an action brought upon the bond or undertaking in a court of competent jurisdiction against the principal and sureties thereon, such bond or undertaking to be in form and in accordance with rules and regulations prescribed by the Secretary of the Interior and to be filed with and approved by the register and receiver of the local land office of the district wherein the land is situate, subject to appeal to the Commissioner of the General Land Office: *Provided*, That all patents issued for the coal or other mineral deposits herein reserved shall contain appropriate notations declaring them to be subject to the provisions of this act with reference to the disposition, occupancy, and use of the land as permitted to an entryman under this act. *Id.*

The filing of an application to make entry of lands subject to entry under this act confers upon the applicant a prior right to the surface that is not subject to contest by a mineral claimant who bases his right upon discovery made after the filing of the homestead application. *Rosetti vs. Dougherty*, 50 L. D. 16. See note 60, *infra*.

upon, prospect and mine the land, thus practically conducting the usual mining operations thereon with the same facility as before the enactment of this statute as it does not repeal the mining law.¹⁶

§ 14. Character of Land.

When an issue is raised between rival applicants, either of them is entitled to a hearing for the purpose of showing that his adversary secured the designation necessary to his entry by making a false or fraudulent representation as to the character of the land.¹⁷

§ 15. Timber and Stone Act.

This act¹⁸ allows entries thereunder under the act of July 17, 1914,¹⁹ for lands withdrawn or classified as valuable for (among other minerals) oil gas, or asphaltic minerals, or which are valuable for those deposits, provided the applicant files his consent, to have the entry stand subject to the provisions and limitations of said act.²⁰

§ 16. Determination of Character of Land.

Lands within the known geologic structures of producing oil or gas fields, or embraced in applications for oil and prospecting permits, or in permits or leases granted, are not subject to entry hereunder until and unless the Secretary of the Interior shall determine that the surface of the lands may be disposed of without detriment to the public interest.²¹

§ 17. Oil and Gas Lands.

A complete equitable title becomes vested upon the claimant's full compliance with the law and the final certificate upon a timber and stone entry is *prima facie* evidence of that title. Thereafter such entryman can not be compelled to accept a limited patent pursuant to the act of July 17, 1914, because of a subsequent report that the land is valuable for oil or gas, unless the government makes the charge and shows upon assumption of the burden of proof that the land was of known mineral character at the date of the perfection of the claim.²²

¹⁶ In *Barker vs. Mintz*, 73 Colo. 262, 215 Pac. 534, it is said: "The land is wild, and its present value, except for coal, is only for pasturage; a very little of it for cultivation. The stripping destroys these values, but the fair and equitable way is so to treat the matter that each party shall get the greatest amount of good with the least possible harm, and that is by allowing the defendant to take out his coal and pay the plaintiff for the damages he thereby does to her estate. He then will get the full value of his property and she will get the full value of hers. Is that not equity?"

¹⁷ *Stokes & Eckert*, 48 L. D. 105.

¹⁸ 5 U. S. Comp. St. p. 5726, § 4671. For entry of building stone lands under the provisions of the law in relation to placer mineral claims see 5 U. S. Comp. St. p. 5678, § 4633. One who has made entry for the full area permitted by the Stock-Raising Homestead Act is thereafter debarred from making a timber and stone entry, or any other form of entry under the agricultural land laws. *Feltner*, 49 L. D. 527.

¹⁹ 5 U. S. Comp. St. p. 5683, § 4640a.

²⁰ See Regulations, 49 L. D. 288.

²¹ *Id.*

²² *Chamberlain*, 48 L. D. 411. A report by a field agent, after the issuance of a final certificate upon such an entry, charging that the land contains oil and gas and was so known at the date of final proof, may be used as a basis for government proceedings against the claim, but it is not competent evidence upon which final action adverse to the claimant may be taken, without charges, notice and an opportunity for a hearing. See *Goodwin*, 43 L. D. 484, *Ireland*, 40 L. D. 484.

The difference between a receiver's receipt and a register's final certificate of entry is that the former, as its name imports, acknowledges the receipt of the money paid. The other certifies to the payment and declares that the claimant on presentation of the certificate to the Commissioner of the General Land Office shall be entitled to a patent. *Stockley vs. U. S.*, *supra*.⁽²⁾

§ 18. Indian Lands.

The Leasing Act did not, expressly nor by implication, repeal nor modify those provisions of the act of February 28, 1891,²³ which relate to the leasing by allottees of lands within Indian reservations.²⁴

²³ 26 Stat. 794. The provisions of this act relating to the leasing by allottees of lands within Indian reservations, were applicable only to such reservations as those created by treaty or congressional action, and prior to the enactment of the Leasing Act no authority existed for the leasing of lands withdrawn from the public domain by Executive order for the use of the Indians. Lands withdrawn from the public domain by Executive order for the use of the Indians are lands "owned by the United States" within the purview of that term as used in the Leasing Act and may be included within an oil and gas prospecting permit under § 13 thereof. Harrison, 49 L. D. 139. For additional requirements to be demanded of permittees and lessees deemed necessary for the protection of the Indians. See Instructions, 50 L. D. 238.

²⁴ Harrison, *supra*, (223)

§ 1. Introductory.

Lands chiefly valuable for petroleum or other mineral oils¹ or a deposit of natural gas² could be located as placer mining claims unless within the boundaries of lands reserved by congress for a public purpose, as, for instance, Indian reservations, military reservations, national parks and reservoir sites or until such mineral lands were included within areas temporarily withdrawn by executive order³ previous to or under the terms of the act of June 25, 1910,⁴ and permanently withdrawn from location and entry under the provisions of the act of February 25, 1920.⁵ Under the terms of the act of July 17, 1914, and the Stock-Raising Homestead Act⁶ the miner is given the right to prospect for, mine and remove the minerals in the land and to occupy so much of the surface as may be required for all purposes reasonably incident to such operations after securing the consent or waiver of the owner of the surface or paying all damages to crops or other tangible improvements to the owner thereof or in lieu thereof giving bond to the United States for the use and benefit of the entryman or owner of the land to secure payment of such damages to the crops, etc.

¹ 29 Stat. 526; *Chrisman vs. Miller*, 197 U. S. 313; *Weed vs. Snook*, 144 Cal. 440, 77 Pac. 1023; *McLemore vs. Express Co.*, 158 Cal. 559, 112 Pac. 59; *Bay vs. Oklahoma Co.*, 13 Okla. 425, 73 Pac. 936.

² *New England Co. vs. Congdon*, 152 Cal. 211, 92 Pac. 180; *Whiting vs. Straup*, 17 Wyo. 19, 95 Pac. 849.

³ In *U. S. vs. Midwest Oil Co.*, 236 U. S. 459, the authority of the President to withdraw oil lands from location and patent was upheld. See also, *Mason vs. U. S.*, 260 U. S. 545; *U. S. vs. Midway Northern Oil Co.*, 232 Fed. 627. For an instance of wrongful entry upon lands embraced within a withdrawal order, see *El Dorado Co. vs. U. S.*, 229 Fed. 949; see, also, *U. S. vs. Dominion Oil Co.*, 241 Fed. 426. For cases involving the issuing of an injunction and the appointment of a receiver to prevent the extraction and waste of oil on withdrawn lands, see *U. S. vs. McCutchen*, 234 Fed. 712; *U. S. vs. Honolulu Con. Oil Co.*, 249 Fed. 168. A petroleum withdrawal impresses the land with a *prima facie* mineral character. *Baxter*, 48 L. D. 126.

⁴ 5 U. S. Comp. St. p. 5320, § 4523, amended 5 U. S. Comp. St. p. 5321, § 4524, so as to include all nonmetalliferous deposits. This legislation is known as the Pickett Act. It is a remedial statute. It was intended to protect *bona fide* occupants of public oil or gas lands who in good faith were at the time of the withdrawal engaged in work leading to discovery by giving them the right to continue their work to a discovery and thereafter to extract and market the oil and to acquire title notwithstanding the withdrawal. *U. S. vs. Rock Oil Co.*, 257 Fed. 333; see *Con. Mutual Oil Co. vs. U. S.*, 245 Fed. 521; *U. S. vs. McCutchen*, *supra*.⁽²⁾ For an instance of what are sufficient to constitute an occupation, possession and due diligence within the provisions of the Pickett Act, see *U. S. vs. Grass Creek Co.*, 236 Fed. 485, and see *Oregon Basin Co.*, 50 L. D. 244. Compare *El Dorado Co. vs. U. S.*, *supra*⁽³⁾; see, also, *U. S. vs. Ohio Oil Co.*, 240 Fed. 1005; *U. S. vs. Stockton Midway Oil Co.*, 240 Fed. 1009. The government by its mining statutes offers to qualified persons the minerals in the public domain through the means of mining locations, and if the offer so made is accepted by compliance and by the location of a valid mining claim in accordance with the statutory provisions before the offer is withdrawn by the government, it can not, after acceptance, withdraw its order, as the offer then becomes binding and an enforceable obligation. But the government may withdraw its offer at any time before acceptance and the situation stands as if no offer had ever been made. In other words, in the absence of a discovery on an oil (or any other mineral) location on the public domain and in the absence on the part of the locator of diligent prosecution of work leading to discovery, even though in actual possession of the claim, as against the government, he is subject at any time to the possibility of a withdrawal of the privileges offered to him and consequently a termination of his rights. *U. S. vs. McCutchen*, *supra*.⁽²⁾

⁵ 2 Supp. U. S. Comp. St. p. 1409, § 4640ff (§ 13). The passage of the Leasing Act of February 25, 1920, was the enactment into law of a broad comprehensive plan of general application by which an entire new system respecting the disposition of lands and the deposits of minerals beneath the surface owned by the United States and valuable for certain specified minerals was adopted. The purpose of this act was to encourage the development of the mineral resources of the country under the principle of permits for exploration and the leasing of the lands owned by the United States. It will be noted that under the terms of said act, all lands owned by the United States were included within its provisions except as to certain lands therein specifically enumerated. *Harrison*, 49 L. D. 139.

⁶ 5 U. S. Comp. St. p. 5683, § 4640a. Act of December 29, 1916 (39 Stat. 862), amended by the act of October 25, 1918. (40 Stat. 1016) and the act of September 29, 1919 (41 Stat. 287). The former act modified the placer mining laws so as to

§ 2. Lands Subject to Disposition Under the Act.

Under the provision of the act of February 25, 1920⁷ (commonly called "The Leasing Act"), oil, oil shale, gas (and other minerals) on the public domain owned by the United States, including those in national forests, but excluding lands acquired under the act known as the Appalachian Forest Act, approved March 1, 1911⁸, and those in national parks, and in lands withdrawn or reserved for military or naval uses or purposes, except as therein provided, shall be subject to disposition in the manner and form provided by that act to citizens of the United States, or to any association of such persons, or to any corporation organized under the laws of the United States, or of any state or territory thereof, and in the case of oil, oil shale, or gas to municipalities.

§ 3. Helium Reserved.

The United States reserves the right to extract helium from all gas from lands permitted, leased, or otherwise, granted under the provisions of the act, under such rules and regulations as shall be prescribed by the Secretary of the Interior.⁹

authorize the issuance of surface patents for lands of the character contemplated by the Stock-Raising Act and duly entered thereunder, and authorized the patenting of the reserved deposits to mineral claimants under the placer mining laws. This intent clearly appears from the following provision in section 9 of that act: "Provided, that all patents issued for the coal or other mineral deposits herein reserved shall contain appropriate notations declaring them to be subject to the provisions of this act with reference to the disposition, occupancy and use of the land as permitted to an entryman under this act." *Dean vs. Lusk Royalty Co.*, 50 L. D. 192. See *Stock-Raising Homesteads*, 48 L. D. 485.

A stock-raising homestead entryman does not have a sufficient interest in the reserved mineral deposits in the lands within his entry to entitle him to protest against the issuance of an oil and gas prospecting permit, except it be in his capacity as a citizen desiring to prevent the perpetration of a fraud upon the government. *Dean vs. Lusk Royalty Co.*, *supra*.

The provisions of the Surface Act of July 17, 1914, and those contained in the Leasing Act are not in conflict, but are the complement of each other. From the homestead entries mineral rights and all incidents essential thereto are reserved, while in the lease and permit that may be issued to the mining claimant the rights pertaining to the estate of the surface claimant must be duly respected and protected. Any question that may arise as to actual possession of any portion of the area, or any possible difficulties between these two claimants, are matters over which the Land Department has no direct jurisdiction. Those matters must be investigated and adjudicated in the local tribunals having jurisdiction over the parties. *Marathon Oil Co. vs. West, U. S. Intervener*, 48 L. D. 150. *Cleveland vs. Johnson* (on rehearing), 48 L. D. 18, involved the construction of said act.

An application for an oil and gas permit embracing lands within a homestead entry, filed by the entryman during the pendency of action by the Land Department upon the question of allowance of his final proof, constitutes an admission that the land has a prospective oil and gas value and amounts to an election to take a restricted patent in accordance with the provisions of the act of July 17, 1914. *Heirs of Corder*, 50 L. D. 185.

A permittee under an oil and gas prospecting permit is not authorized to injure the permanent improvements of a stock-raising homestead entryman, and damage to crops must be compensated for as provided by section 9 of the act of December 26, 1916. *Dean vs. Lusk Royalty Co.*, *supra*. See note 60, *infra*.

⁷ 2 Supp. U. S. Comp. St. p. 1404, § 46403. This act supersedes the provisions of the mining laws in so far as the minerals named therein are concerned and it makes specific provision for various classes of preference rights. *Amerman vs. Mackenzie*, 48 L. D. 580.

⁸ Stat. 1911, p. 961. Ownership by the government of lands abutting upon a meandered nonnavigable body of water carries with it the same rights with respect to submerged land opposite thereto that private ownership does, and such rights pass by permit or lease of the government-owned uplands as well as by patent to such lands. A prospecting permit or permit application, therefore, covering land abutting a meandered nonnavigable body of water embraces the adjacent submerged area, as well as the upland. Lands beneath the waters of a nonnavigable lake which is surrounded by tracts that have been patented by the government or are embraced within existing claims or pending applications are not subject apart from the abutting uplands to the oil prospecting permit or lease provisions of the Leasing Act. *Phelus*, 48 L. D. 128.

⁹ 2 Supp. U. S. Comp. St. p. 1404, § 46403.

§ 4. No Substantial Delay.

In the extraction of helium from gas produced from such lands, it shall be so extracted as to cause no substantial delay in the delivery of gas produced from the well to the purchaser thereof.¹⁰

§ 5. Persons Excepted.

Citizens of another country, the laws, customs or regulations of which deny similar or like privileges to citizens or corporations of this country, shall not by stock holding, or stock control, own any interest in any lease acquired under the provisions of this act.¹¹

§ 6. Prospecting Permit for Oil or Gas.

Under the terms of the act and the rules and regulations prescribed by the Secretary of the Interior a qualified applicant may be granted the exclusive right, for a period not exceeding two years to prospect for oil or gas upon not to exceed two thousand five hundred and sixty acres of land wherein such deposits belong to the United States and are not within any known geological structure of a producing oil or gas field upon condition that the permittee shall begin drilling operations within six months from the date of the permit, drill one or more wells for oil or gas to a depth of not less than five hundred feet each, unless valuable deposits of oil or gas shall be sooner discovered, and shall, within two years from date of the permit, drill for oil or gas to an aggregate depth of not less than two thousand feet unless valuable deposits of oil or gas shall be sooner discovered.¹²

¹⁰ Id.

¹¹ Id. While an oil and gas prospecting permit can not be issued under the act to an alien, yet there is nothing in the law nor the practice of the Land Department that forbids the issuance thereof to a citizen who is naturalized after the filing of the application but before the granting of the permit. O'Rourke, 48 L. D. 215; see, also, Manuel vs. Wulff, 152 U. S. 505. The same rule has uniformly been followed by the Land Department in homestead cases. See Lerow vs. Grant, 32 L. D. 403, and cases there cited. Upon the granting of an oil prospecting permit rights thereunder attach as of the date of the application. Brennan, 48 L. D. 108. See, also, Lee, 49 L. D. 175.

¹² 2 Supp. U. S. Comp. St. p. 1409, § 46401ff (§ 13). It always is possible that when a structure must be defined long before it is completely drilled up, it may include territory that will later prove to be nonproductive and may exclude land that later is proved to be productive, because no accurate prediction can be made as to the distance down the flanks of the fold to which the oil or gas will extend. Hopkins, 50 L. D. 213. Land that is not within a designated oil or gas structure nevertheless is to be treated as valuable for oil and gas when embraced within a prospecting permit. Brennan, *supra*.⁽¹¹⁾ Where qualified persons have filed proper applications for oil or gas permits they can not be deprived of their rights because of a delay in action upon the application so filed due to there intervening a designation by the Land Department of the lands being within the geological structure of a producing oil or gas field occasioned by a discovery of oil or gas subsequent to the filing of the application in the local land office. Oil Prospecting Permit, 48 L. D. 98. Compare Mason (on petition), 48 L. D. 213, in which case the Land Department said: "With respect to the particular lands here in question, the Director of the Geological Survey reports that the said lands formed a part of the known geological structure of the Elk Hills field for some years prior to the passage of the Leasing Act, and, therefore, before any rights could be initiated under that act. It is clear, therefore, that notwithstanding the fact that the land may not have been designated by the Director of the Geological Survey as within the known geological structure of a producing oil and gas field until after the application of Mason was filed, the land was not subject to permit under section 13 of the act for the reason that as a matter of fact it was at the time of the filing of Mason's application known to be within such a geological structure." Once a structure is pronounced as producing, and this definition is acquiesced in by the persons whose applications preceded its definition, but were made after the discovery prompting it, they may not thereafter, by filing applications for reinstatement alleging later developments, revive their former applications, but must, in order to receive permits, file the first proper application after the lands are restored from the defined structure, which was, in effect, a withdrawal from appropriation under section 13. Hopkins, *supra*.

The denial of an application for oil and gas prospecting permit is a proper exercise of the discretionary authority conferred upon the Secretary of the Interior, if the

§ 6a. Extension of Time.

If it appears that the permittee has been unable with the exercise of diligence, to begin drilling operations or to drill wells of the depth and within the time aforesaid, the Secretary of the Interior may extend the time for beginning such drilling or completing it, to the amount specified in the act for such time, not exceeding three years, and upon such conditions as he shall prescribe.¹³

§ 7. Preliminary Demarcation.

Whether the lands sought in any such application and permit are surveyed or unsurveyed the applicant shall, prior to filing his application for permit, locate such lands in a reasonably compact form and according to the legal subdivisions of the public land surveys if the

lands to be prospected were at the time of the filing of the application within a known geological structure, although not designated as such until subsequently thereto. When the limits of a producing oil and gas field are determined by the Geological Survey, and the same is designated by it as such, the designation relates to the time that the production began, and the filing of an application for a prospecting permit for lands then known to be within a producing oil field, although not yet designated, does not confer upon the applicant any vested right or constitute a ground upon which the granting of a permit under the act can be enforced by him. Haupt, 48 L. D. 355. This case cites and follows the cases of Mason, *supra*, and Watson, 48 L. D. 214, and cites and construes the cases of Payne vs. C. P. R. Co., 255 U. S. 228; Payne vs. New Mexico, 255 U. S. 367; Payne vs. U. S., 255 U. S. 438; Wyoming vs. U. S., 255 U. S. 489.

The definition of a structure as within a producing oil and gas field is in effect a withdrawal of the lands from appropriation under § 13 of the Leasing Act, and an application for a permit, even though filed prior to such definition, does not confer any rights upon the applicant that will inure to his benefit upon the exclusion of the lands by reason of the redefinition of the structure. Where an application for a prospecting permit is denied because of the inclusion of the lands within a producing oil and gas field, such application can not be revived by reinstatement upon a subsequent restoration of the lands, but they will be open to prospecting after their restoration as though no application had been filed. Hopkins, *supra*. There is nothing in the Leasing Act nor the regulations thereunder which gives exclusive segregative effect to a mere application for a prospecting permit. Until the Land Department has satisfied itself as to the qualifications of the first applicant and issued a permit to him, applications may be filed by others and if the first application is rejected their claims will be considered in the order initiated until one qualified to receive a permit is found; after which all subsequent applications must be rejected. Eaton vs. Butts, 50 L. D. 341.

¹³ 2 Supp. U. S. Comp. St. p. 1410, § 4640½fff. The Land Department has held that in case a permittee is unable to begin drilling operations with the exercise of diligence within six months from date of the permit, action will not be taken looking to the cancellation of the permit but that twelve months and ten days from date thereof authorized, every permittee is required to file a corroborated affidavit specifying the work done upon the land embraced in the permit, together with such other information as may be pertinent to his operations thereon. Tieck vs. McNeill, 48 L. D. 158.

A permittee who has been unable with the exercise of due diligence to comply with the terms of the permit issued under any section of the act, may, if the facts warrant, be granted an extension of time upon filing an application therefor, accompanied by his own affidavit setting forth what effort, if any, he has made to comply with the terms of his permit and the reasons for delay in the full compliance therewith, and such showing to be accompanied by a corroborating affidavit of at least one disinterested person having actual knowledge of the facts.

The affidavit by the applicant must also show the time when he proposes to commence or resume his operations and any arrangements he has made for complying with the terms of the permit.

An extension of time to perform one of the acts required by the permit necessarily extends for the same period the time for the performance of all subsequent requirements, and as the bond is expressly limited by its terms to the period for which the permit was granted, the permittee must furnish a properly executed assent by the surety to the extension of his bond to cover the life of the permit as it will be extended if an extension is granted.

The application may be filed in the General Land Office or in the local land office having jurisdiction over the land involved by the permit. In the latter event proper applications will be promptly forwarded to the first named office by the local officers.

In cases where applications for extensions, filed in the local offices, are not in affidavit form and duly corroborated or are not accompanied by the required assent by the sureties on the bonds the local officers will require the permittee to remedy these defects within fifteen days from receipt of notice and will transmit the applications with evidence of service and a report of action taken at the expiration of the time allowed. Instructions, 49 L. D. 403. An oil and gas prospecting permit is to be considered in force until it has been canceled by the General Land Office and the cancellation noted upon the tract books of the local land office. Instructions, 50 L. D. 364. As to notation of cancellations, see Instructions, 50 L. D. 299.

land be surveyed; and in an approximately square or rectangular tract if the land be an unsurveyed tract, the length of which shall not exceed two and one-half times its width.¹⁴

§8. Monument and Notice.

If the applicant shall cause to be erected upon the land for which a permit is sought a monument not less than four feet high, at some conspicuous place thereon, and he shall post a notice in writing on or near said monument, stating that an application for permit will be made within thirty days after posting said notice, the name of the applicant, the date of the notice, and such a general description of the land to be covered by such permit by reference to courses and

¹⁴ 2 Supp. U. S. Comp. St. p. 1409, § 4640~~ff~~ (§ 13). See § 11, *infra*. While it is essential to the validity of a mining location that there be a prior marking of the boundaries of the property upon the ground so that the same may be readily traced, it is not believed that Congress intended by the use of the word "locate" in the Leasing Act, to impose any such requirement upon an applicant for a permit to prospect for oil or gas. On the contrary, it would seem that the act contemplates that the right to a permit may be initiated by filing an application therefor in the land office, specifically describing them by legal subdivisions, if surveyed, and if unsurveyed, by metes and bounds. This view is strongly supported in the further provision of the act which reads: "The applicant shall, within ninety days after receiving a permit, mark each of the corners of the tract described in the permit upon the ground with substantial monuments, so that the boundaries can be readily traced on the ground, and shall post in a conspicuous place upon the lands that such permit has been granted and a description of the lands covered thereby." This makes clear that one to whom a permit has been granted must thereafter go upon the lands and establish such monuments and post such notice as will make it easily understood by others inspecting the land to what extent it is claimed by the prior applicant. Manifestly the purpose of the act in primarily requiring of an applicant for a permit that he "locates such lands in a reasonably compact form" was to provide a plan for orderly arrangement and selection and to demand of the applicant that he determine, choose or locate the lands to be prospected, with due regard to form, shape and external lines. The condition imposed relates solely to these matters and was not intended to mean that the area applied for should in the first instance be located in the same manner as mining claims are located under the mining laws of the United States. Van Houten & Dowd, 48 L. D. 185.

In prescribing the length and width of unsurveyed tracts which may be embraced in prospecting permits, Congress apparently intended to prevent an applicant from securing an undue advantage by locating a long and narrow tract of land across a geologic structure, and assumed that unsurveyed land was unappropriated and could be taken in the prescribed form. In construing the provisions of section 13 as to compactness of areas that may be included in a prospecting permit the Land Department has held that those provisions of the section were directory, not mandatory. For example, it has been held that incontiguous tracts within a square of six miles may be included in a permit where conditions are such that, because of prior disposals, a reasonable area of contiguous land can not be procured. Mathews, 48 L. D. 239. This case is cited in the case of Spindle Top Oil Ass'n. vs. Downing, 48 L. D. 555, and therein it is said: "The Department has held that the requirement of the statute is directory and not mandatory. (Fred Mathews, 48 L. D. 239). The rule as laid down in the regulations is that incontiguous tracts within a limited radius may be included in a permit when conditions are such that because of prior disposals a reasonable area of contiguous land can not be procured. This is a flexible rule and each case presented must be considered in the light of the particulars existing therein. Where an applicant in good faith presents an application which the Commissioner determines does not conform to the requirements of compactness, it has been the practice to allow him to make an election as to the tracts he will retain, and such right is not defeated by a subsequent section 13 application. The defect is considered to be a curable defect, and in this case it was cured within the time allowed by the Commissioner." See Dripps vs. Allison Mines Co., 45 Cal. A. 95, 187 Pac. 448. There is nothing in the Leasing Act which expressly directs or indeed suggests that the maximum area may at all times be applied for and the issuance of a permit therefore insisted upon by the applicant. On the contrary, the expressed requirement that permits for surveyed lands cover an area in a reasonably compact form suggests a limitation which must prevail as against the provision that prospecting permits shall be issued for "not to exceed two thousand five hundred and sixty acres." The fact that but one test well is required to prove the oil-bearing character of all the land covered by a permit, thus making it subject to lease, also presents an added reason for holding that one permit can only be issued for incontiguous tracts which are, as stated in the Regulations of March 11, 1920 (47 L. D. 437), within a "limited radius." The Land Department has held on numerous occasions that a general area equal to a township, that is, an area six miles square, represents the maximum over which prospecting can properly be carried on under one permit, pursuant to the Leasing Act. This construction of what constitutes an area in a "reasonably compact form" within the meaning of this section of the act is one of extreme liberality which the Land Department states it will not be warranted in modifying by way of enlargement except in cases involving special conditions. Curns, 50 L. D. 353.

distances from such monument and such other natural objects and permanent monuments as will reasonably identify the land, stating the amount thereof in acres, he shall during the period of thirty days following such marking and posting, be entitled to a preference right over others to a permit for the land so identified.¹⁵

¹⁵ 2 Supp. U. S. Comp. St. p. 1409, § 4640^{1/2} ff. (§ 13). The monument may be of iron, stone, or durable wood, not less than four inches square or in diameter, and must be firmly embedded in the ground. The notice must be so protected as to prevent its destruction by the elements. The preference right accorded by the act in the award of an oil and gas prospecting permit to one who has properly monumented and posted notice in accordance with the provisions of the act must be denied if the terms of the act with respect thereto are not strictly complied with. For example, should it be made to appear that the monument erected by one who seeks a preference right was less than four feet high, the Land Department would feel obligated to deny the claim of preference right. *Blakesley vs. McCord*, 49 L. D. 419. As between two conflicting applications for an oil and gas prospecting permit, no such preference right is acquired by the second applicant by reason of his previous location of the land and posting of notice thereon as will defeat a proper application filed prior thereto. *Van Houton vs. Dowd*, *supra*.⁽¹⁾

The act does not require the posting of notice on the land preliminary to the filing of an application for an oil and gas prospecting permit, and one who posts notice and applies for a permit under section 13 of the act after filing an application by another under that section does not acquire a preference right to a permit. *Spindle Top Oil Assn. vs. Downing*, *supra*.⁽²⁾ The general Rules of Practice relating to the serving of notice are applicable to oil prospecting permit cases in which the question of preferred right is involved with respect to unperfected and patented entries containing reservation of the minerals to the United States, and the regulation which requires personal service is to be construed to include actual service by registered mail, when possible, or by publication when proper showing is made that the person to be served can not be found. *Stevens*, 48 L. D. 110. For Rules of Practice see 48 L. D. 246.

In the case of *Rousseau* (47 L. D. 590), it appears that *Rousseau's* application for a permit to prospect for oil and gas upon certain lands was not filed in the local land office until the thirty-first day after the posting of his notice upon the land included therein. The last day of the thirty-day period succeeding the date of posting fell on Sunday and this fact gave rise to the question as to whether, in such a case, the last day should be included in the period, or, on the other hand, excluded therefrom and the succeeding day be included. If such a Sunday is entitled to be excluded, the filing of *Rousseau* was in time; otherwise, it was one day out of time. It is provided in Rule 94 of Practice of the Land Department that—"In computing time for service under the rules of practice, the first day shall be excluded and the last day included: Provided, That where the last day is a Sunday, a legal holiday, or half holiday, such time shall include the next full business day." In the case of *Street vs. U. S.*, (133 U. S. 306), it is declared by the Supreme Court of the United States that Sunday is a *dies non* and that—"A power may be exercised up to and including a given day of the month may generally, when that day happens to be a Sunday, be exercised on the succeeding day." In *Monroe Cattle Co. vs. Becker*, 147 U. S. 56, it is held to be a general rule that—"When an act is to be performed within a certain number of days, and the last day falls on Sunday, the person charged with the performance of the act has the following day to comply with his obligation."

The above quoted provisions of said Rule 94 are thus in full accord with what the Supreme Court of the United States has held to be the general rule in cases where the last day of the period within which an act is to be performed falls on Sunday, and the Land Department is of opinion that the same principle should be followed with respect to all filings required by statute to be made in the Land Department within a limited period, viz. that if the last day of a statutory period within which a filing is required to be made falls on Sunday or a legal holiday, such time shall be held to include the next following business day.

Authority to consider and determine the merits and validity of applications for oil and gas prospecting permits, in the first instance, resides in the Commissioner of the General Land Office, and the fact that the local officers, whose functions in this respect are merely ministerial, received without rejection an application, together with the prescribed bond and fees, does not of itself confer upon the applicant any right to have his application allowed. *Craig*, 50 L. D. 202.

Rights to an oil and gas prospecting permit do not attach prior to the filing of an application in the form and manner prescribed by the act and the Departmental Regulations issued thereunder, and the mere posting of a notice of intention to apply for a permit is not sufficient to defeat the provisions of § 13 of the act, which limits its operation to land that is "not within any known geological structure of a producing oil or gas field." *Lee*, *supra*.⁽³⁾ An application for an oil and gas prospecting permit is in effect a mere request that a license be granted and confers upon the applicant no interest in the lands or the mineral deposits therein. *Enlow vs. Shaw*, 50 L. D. 339.

In the case of Judge (49 L. D. 171) the Land Department laid down the general rule that until an outstanding permit is canceled by the Commissioner of the General Land Office, and the notation of the cancellation made in the local office, no other person will be permitted to gain any right to a permit for the same class of deposits on the land included therein by the filing of an application therefor or by the posting of notice of intention to apply for a permit. See, also, *New Mexico vs. Weed*, 49 L. D. 580. In *Purvis vs. Witt* (49 L. D. 260), it was held that a duly corroborated protest or contest against a permit sufficiently alleging failure to comply with the

§ 9. Additional Demarcation.

The applicant shall, within ninety days after receiving a permit, mark each of the corners of the tract described in the permit upon the ground with substantial monuments, so that the boundaries can be readily traced on the ground, and shall post in a conspicuous place upon the lands a notice that such permit has been granted and a description of the lands covered thereby.¹⁶

§ 10. Lease to Permittee.

Upon establishing to the satisfaction of the Secretary of the Interior that valuable deposits of oil or gas have been discovered within the limits of the land embraced in any permit, the permittee shall be entitled to a lease for one-fourth of the land embraced in the prospecting permit: *Provided*, That the permittee shall be granted a lease for

law in matters not shown by the records or known to the Land Department should be entertained and considered by said commissioner with a view to the ordering of a hearing for the ascertainment of the facts. There was nothing in this decision which in any way modified the rule announced in the Judge Case, or suggested that a protestant would gain a preference right to a permit in the event the protest was sustained. Section 2 of the act of May 14, 1880 (21 Stat. 140), as amended by the act of July 26, 1892 (27 Stat. 270), has no application to contests against permits under the Leasing Act, and the act itself gives no such preference right. The fact that a permit application for deposits covered by an existing permit is accompanied by a protest which ultimately results in its cancellation does not give the applicant any special or preferred status, or except from the operation of the general rule. The permit has a segregative effect, the deposits covered by it are not the subject of appropriation until it is canceled and notation thereof made in the local land office, and an application therefor filed prior to that time will not be recognized. *Stahl vs. Stiffler*, 49 L. D. 406.

A protest by an oil placer mining claimant against the allowance of a prospecting permit, containing no allegation which, if substantiated by evidence adduced at a hearing, shows that the protestant is entitled to complete his claim under the placer mining laws or to use the same as a basis for a permit or lease under any of the relief provisions of the act, is not sufficient to defeat a permit application filed under section 13 of the act. *McGee vs. Wooten*, 48 L. D. 147.

The Leasing Act does not presume to take away from the owner of a valid subsisting oil placer mining claim vested rights which he might have accruing through operation under the placer law prior to the Leasing Act. Such owner is not required to make an application to the Department of the Interior for a lease upon the premises, but has the right, if he so desires, at his own option to maintain and prosecute his claim under the placer mining law, through which it had been taken up. He may, however, give up his right to prosecute it under the placer mining law. He may, however, transfer his title in and to the property by deed to the government as a condition precedent to receiving a lease. *Robbins vs. Elk Basin Co.*, 285 Fed. 179.

¹⁶ 2 Supp. U. S. Comp. St. p. 1409, § 4640^{1/2} ff. (§ 13). In *Tieck vs. McNeill*, *supra*,⁽¹³⁾ it is said: "The purpose of posting and marking the corners on the land embraced in a permit is to give notice of the fact that a permit has been granted for that particular tract of land. In this case it appears that the protestant is fully aware that a permit was granted for said land and his only purpose in seeking the cancellation of the permit is to enable him to make application for a permit. To allow contests against permits for such purpose would be to invite endless litigation, which would tend to defeat the very purpose of the oil and gas leasing act, to wit: developing of the oil and gas resources of the country. The only question raised by this protest is whether an oil and gas permit is subject to contest by a third party. The only parties in the case of an oil and gas permit is the permittee and the United States and a contestant could acquire no preference right to a permit though the contest was sustained and the permit canceled. The enforcement of the stipulation in a permit rests with the Department and evidence that the permittee is not complying with the terms of his permit is welcome, but a contest by a third party is not the proper procedure and the application is, therefore, denied and the protest dismissed without right of appeal."

Where an application for a permit is filed in good faith for lands shown by the records of the local land office to be free from conflicting claims, such application constitutes a bar to the amendment of subsisting permit applications, although based upon location notices posted upon the land, if there were no apparent error in those applications when filed. A location notice, posted as prescribed by the act, has a segregative effect for a period of thirty days only, and when an application for a permit is filed the application becomes the notice to all applicants that the land described therein is adversely claimed and can not be amended after the expiration of the thirty-day period to conform to the description posted, in the presence of a *bona fide* intervening claim. Neither the act nor the Departmental regulations issued pursuant thereto make distinction between surveyed and unsurveyed lands as to preference rights initiated under the provisions of the act by the posting of location notices, except that greater particularity is required in the descriptions of lands of the latter class. *Wagner vs. Coffin*, 49 L. D. 655. See *Eaton vs. Butts*, *supra*.⁽¹²⁾

as much as one hundred and sixty acres of said lands, if there be that number of acres within the permit.¹⁷

§ 11. Survey of Land.

The area to be selected by the permittee, shall be in compact form and, if surveyed, to be described by the legal subdivisions of the public land surveys; if unsurveyed, to be surveyed by the government at the expense of the applicant for lease in accordance with the rules and regulations to be prescribed by the Secretary of the Interior and the lands leased shall be conformed to and taken in accordance with the legal subdivisions of such surveys; deposits made to cover expense of surveys shall be deemed appropriated for that purpose, and any excess deposits may be repaid to the person or persons making such deposit or their legal representatives.¹⁸

§ 12. Term of Lease, Royalty and Rent.

Such leases shall be for a term of twenty years upon a royalty of five per centum in amount or value of the production and the annual payment in advance of a rental of one dollar per acre, the rental paid for any one year to be credited against the royalties as they accrue for that year, with the right of renewal as prescribed in section 17 of the act.¹⁹

§ 13. Lease for Remainder of Land.

The permittee shall also be entitled to a preference right to a lease for the remainder of the land in his prospecting permit at a royalty

¹⁷ 2 Supp. U. S. Comp. St. p. 1410, § 4640½g (§ 14).

¹⁸ Id. See note 14, *supra*.

¹⁹ Id. The date of the filing of the application, not the date of the granting of the lease, determines the time from which the annual rental begins to accrue, where an oil and gas lease is granted pursuant to the act, to an applicant who, from and after the filing of the application therefor, has had uninterrupted possession and use of the premises. *Big-4 Oil Co.*, 49 L. D. 482. If a permittee assign to one person his permit rights with respect to a fractional part of the area included in his permit, and intended to represent five per cent land, and assign to another person the remainder of the permitted tract, it will be necessary, upon the discovery of oil or gas upon the permitted tract, for each of the assignees seeking a lease to covenant separately and individually with the government for drilling upon the area included in his assignment, as leases which might be issued to such assignees would represent separate and distinct undertakings. Where the permit rights are assigned to specific tracts covered by a permit to several individuals, each person acquiring a separate tract, it must necessarily follow that upon discovery and the issuance of leases a separate lease will issue to each individual and each individual will be obligated to the government as to that particular tract, hence it follows that each individual in complying with the terms of the lease must proceed to the drilling operations covered by his lease. There are no particular circumstances that can be advanced to justify the waiving of the obligation to proceed to drilling in such instances, but where the enforcement of this rule would appear to be inequitable upon a showing to this effect the government will give each particular case its individual attention, and, if the particular facts justify suspension of the requirement, such action will be taken.

Where the permittee, upon the discovery of oil or gas, takes in his own name one lease for a part of the area under a five per cent royalty and another lease of the remainder of the area on a sliding scale royalty, these leases are designated by the Land Department as A and B, respectively, and so long as they remain in the name of the original permittee they may for certain purposes be regarded as one obligation, but it is obvious that the law does not intend that the lessee may, nor will the Land Department permit him to, confine his drilling to the land upon which he is paying five per cent royalty, and defer drilling upon the remainder of the land with respect to which, under the law and regulations, he is required to pay the higher royalty. In such cases the lessee will also be required to comply with the drilling regulations as to both tracts as provided in paragraph (b), section 2, of the lease, viz: to not only drill wells to offset wells on adjoining privately owned lands, but to also promptly drill wells on the said higher royalty lands to offset wells drilled by him on his five per cent area. The practice of the Land Department, in regarding such leases as a single undertaking for certain purposes is merely for the convenience of the lessee and the Land Department and is not designed to relieve the lessee of the necessity of complying with his obligations as to drilling with respect to either the five per cent or the higher royalty portion of the area. *Armstrong*, 49 L. D. 445.

of not less than $12\frac{1}{2}$ per centum in amount or value of the production, and under such other conditions as are fixed for oil or gas leases in this act, the royalty to be determined by competitive bidding or fixed by such other method as the Secretary may by regulations prescribe: *Provided*, that the Secretary shall have the right to reject any and all bids.²⁰

§ 14. Payments Prior to Lease.

Until the permittee shall apply for lease to the one-quarter of the permit area provided for in the act he shall pay to the United States twenty per centum of the gross value of all oil or gas secured by him from the lands embraced within his permit and sold or otherwise disposed of or held by him for sale or other disposition.²¹

§ 15. Conditions of Permit or Lease.

All permits and leases containing oil or gas, made or issued under the provisions of the act, shall be subject to the condition that no wells shall be drilled within two hundred feet of any of the outer boundaries of the lands so permitted or leased, unless the adjoining lands have been patented or the title thereto otherwise vested in private owners, and to the further condition that the permittee or lessee will, in conducting his explorations and mining operations, use all reasonable precautions to prevent waste of oil or gas developed in the land, or the entrance of water through wells drilled by him to the oil sands or oil-bearing strata, to the destruction or injury of the oil deposits. Violations of the provisions of this section (16 of the act) shall constitute grounds for the forfeiture of the permit or lease, to be enforced through appropriate proceedings in courts of competent jurisdiction.²²

§ 16. Competitive Bidding.

All unappropriated deposits of oil or gas situated within the known geological structure of a producing oil or gas field and the unentered lands containing the same, not subject to preferential lease, may be leased by the Secretary of the Interior to the highest responsible bidder by competitive bidding under general regulations to qualified applicants in areas not exceeding six hundred and forty acres and in tracts which shall not exceed in length two and one-half times their width, such leases to be conditioned upon the payment by the lessee of such bonus as may be accepted and of such royalty as may be fixed in the lease, which shall not be less than $12\frac{1}{2}$ per centum in amount or value of the production, and the payment in advance of a rental of not less than one dollar per acre per annum thereafter during the continuance of the lease, the rental paid for any one year to be credited against the royalties as they accrue for that year.²³

§ 17. Period of Lease.

Leases shall be for a period of twenty years, with the preferential right in the lessee to renew the same for successive periods of ten

²⁰ 2 Supp. U. S. Comp. St. p. 1410, § 4640 $\frac{1}{2}$ *g* (§ 14).

²¹ 2 Supp. U. S. Comp. St. p. 1410, § 4640 $\frac{1}{2}$ *gg* (§ 15).

²² 2 U. S. Comp. St. p. 1411, § 4640 $\frac{1}{2}$ *h* (§ 16).

²³ 2 U. S. Comp. St. p. 1411, § 4640 $\frac{1}{2}$ *hh* (§ 17).

years upon such reasonable terms and conditions as may be prescribed by the Secretary of the Interior, unless otherwise provided by law at the time of the expiration of such periods.²⁴

§ 18. Reduction of Royalty.

Whenever the average daily production of any oil well shall not exceed ten barrels per day, the Secretary of the Interior is authorized to reduce the royalty on future production when in his judgment the wells can not be successfully operated upon the royalty fixed in the lease. The provisions of section seventeen of the act shall apply to all oil and gas leases made under the provisions of said act.²⁵

§ 19. Relinquishment of Placer Claims.

Under the provisions of the act claimants of oil or gas locations, under the preexisting placer mining law, and which locations were within certain withdrawn areas, could relinquish their right thereto and obtain a lease thereof. Such a lease was conditioned upon the payment of royalty to the United States of an amount equal to the value of one-eighth of all oil or gas with certain prescribed exceptions, produced from the relinquished area, and the fulfillment of other requirements enumerated within section eighteen of the act.²⁶

§ 20. Inuring Clause.

All leases under the act shall inure to the benefit of the claimant and all persons claiming through or under him by lease, contract, or otherwise, as their interests may appear, subject, however, to the same limitation as to area and acreage as is provided in section 18 of the act. No lease nor leases under said section shall be granted, nor shall any interest therein, inure to any person, association, or corporation for a greater aggregate area or acreage than the maximum in said section provided for.²⁷

²⁴ 2 U. S. Comp. St. p. 1411, § 4640¹hh (§ 17).

²⁵ *Id.*

²⁶ 2 Supp. U. S. Comp. St. p. 1411, § 4640¹i (§ 18). For determination of the validity of gas claims under preexisting law to land embraced in the Executive order of withdrawal issued September 27, 1909, (§ 18a), see 2 Supp. U. S. Comp. St. p. 1413, § 4640¹ii. This provision was extended to Utah by act of September 15, 1922, 42 Stat. 844. Estate of Ladd (on rehearing), 48 L. D. 313. This section of the act also provides for the settlement of all suits brought by the government affecting such lands and the release of impounded royalties. In the Ladd Case it was said: "This provision indicates unmistakably that the granting of a lease under section 18 was intended by the act to be made a matter wholly independent of any contract that might have been entered into by the lease applicant or his predecessor or predecessors in interest with respect to the land, under the provisions of the act of August 25, 1914. It does, however, contemplate that controversies giving rise to such contracts, shall, as well as suits, be settled in harmony with the provisions of section 18 of the Leasing Act and that moneys impounded pursuant to such contracts shall be paid in accordance with settlements and adjustments so made."

²⁷ 2 Supp. U. S. Comp. St. p. 1413, § 4640¹i (§ 18). The issuance of an oil and gas lease by the Department of the Interior to the owner of placer mining claims on the application of such owner and the holders of a lease from him is not an adjudication of the rights of such lessee as against earlier lessees especially in view of the "inuring" clause of the Leasing Act. Burke vs. Horth, 296 Fed. 256. See, also, note 92, *infra*.

It clearly appears from this section and from the following section 19 that the "claimant" is the person who located the land under the mining laws or who claims under the locator or locators through a deed or equivalent instrument. That lessees of such person or persons claiming under them through drilling contracts or other arrangements are not regarded as persons eligible to a lease from the United States. The purpose of section 18 of the act obviously is to permit the Land Department to deal with the holder or holders of the record mining title. He or they must surrender and convey that title to the United States. Those who claim through or under him are not recognized as persons entitled to a lease, but their interest is protected by the inuring clause so that if lease issue to him, their interests may be determined by agreement or litigation in the proper form and protected. Burke vs. Taylor (on rehearing), 47 L. D. 586.

§ 21. Placer Claims Lacking Discovery.

Any person who on October 1, 1919, was a *bona fide* occupant or claimant of oil or gas lands under a claim initiated while such lands were not withdrawn from oil or gas location and entry, and who had previously performed all acts under then existing laws necessary to valid locations thereof except to make discovery, and upon which discovery had not been made prior to the passage of the act, and who had performed work or expended on or for the benefit of such locations an amount equal in the aggregate of two hundred and fifty dollars for each location if application therefor shall be made within six months from the passage of the act shall be entitled to prospecting permits thereon upon the same terms and conditions, and limitations as to acreage, as other permits provided for in this act.²⁵

²⁵ 2 Supp. U. S. Comp. St. p. 1413, § 46401j (§ 19). See *Cotner vs. Isgrig*, 49 L. D. 224. The right conferred by this section is in the nature of a preference right or privilege which may be exercised or waived, at the option of the occupant or claimant, and is of necessity waived if not asserted within the time and in the manner prescribed by the law and the applicable regulations. When so waived, the land becomes subject to disposition to the public generally or to any other claimant recognized by the law as entitled to priority. *Murane*, 48 L. D. 526. The claim of an applicant for a lease under the relief provisions of this section (19 of the act), who asserts in support thereof an inchoate right under the placer mining laws, but who, during a period of several years prior to October 1, 1919, never made a discovery of oil or gas, stood idly by and without protest permitted others to acquire apparent title, and deal with as their own, and as though he had no right, must be treated as an abandoned claim, not entitled to equitable consideration under said section. *Bradley*, 49 L. D. 235, citing *Gallagher vs. Caldwell*, 145 U. S. 368; *Moran vs. Horsky*, 178 U. S. 205; *Burke vs. Taylor*, 47 L. D. 585. An applicant for an oil and gas prospecting permit under section 19, who is unable to show sufficient fulfillment of the expenditure requirement of that section necessary to entitle him to a permit thereunder, can not be allowed to amend his application and take a permit under section 13 of the act in the presence of an adverse claim existing by reason of the pendency of an application previously filed by another under the latter section. *Keenan*, 48 L. D. 218.

In the case of *Sullivan vs. Tendolle* (48 L. D. 337), it is said: "Section 19 of the Leasing Act under which the application was filed provides, among other things, that the claim upon which the application is predicated must have been initiated while the land was not withdrawn from oil and gas location and that the claimant must have previously performed all acts under then existing laws necessary to a valid location except to make discovery. At the time the asserted location of the Tip No. 7 claim is alleged to have been made, the land in question was included in the *prima facie* valid homestead entry of Tendolle; and said entry has ever since remained intact, and down to November 22, 1920, long after the date of the initiation of the claim under the mining laws to the land, and nine months after the passage of the Leasing Act, the entry was unrestricted. The general rule announced by the Supreme Court of the United States is that a *prima facie* valid entry of public land under the laws of the United States segregates the land from the public domain, appropriates it to private use, and withdraws it from subsequent entry or acquisition until such entry has been canceled of record. See *Neff vs. U. S.* (165 Fed. 273, 281), and cases there cited. While the cases cited involve conflicts between subsisting agricultural entries and junior nonmineral claims, the Supreme Court, in *Bunker Hill and Sullivan Mining Company vs. U. S.* (226 U. S. 548), declared that the same principle would apply in case of a conflict between an uncanceled homestead entry and an attempted junior mining location. In that case it was urged that certain land covered by the homestead entry of one Messenger, from which timber had been cut by the entryman and sold to the plaintiff in error, was not suited for agricultural purposes and could not be entered under the homestead law; that being mineral land in fact and open to mining location, it was subject to the provisions of the act of June 3, 1878 (20 Stat. 88), which authorizes any citizen of the United States to enter upon public lands open to mineral entry in order to cut timber therefrom; that the homestead entry was void, and that any citizen, the entryman included, could treat the land as public land of the United States and cut the timber thereon. Answering that contention, the court said: 'The statute on which the mining company relies, applies only to public lands, while this was no longer public in the full sense, although the title remained in the government which could have canceled Messenger's entry on proof that it was valuable for mineral purposes. *Deffebach vs. Hawke* (115 U. S. 302). But until some such action by the United States, Messenger's entry segregated the land from the public domain and made it so far private as to withdraw it from the operation of the law permitting other citizens to locate mines or cut timber on public mineral lands. *Hastings & D. R. Co. vs. Whitney* (132 U. S. 537); *Shiver vs. U. S.* (159 U. S. 491, 495). Until his claim was canceled Messenger was entitled to exclude others from the quarter-section. And as they would have been estopped, as against him, from denying that he was lawfully in possession of it as a homestead, so was he estopped from denying that it was a homestead when sued for cutting timber in violation of the law applicable thereto.' To the same effect also is the decision in *McLemore vs. Express Oil Co.* (158 Cal. 569, 112 Pac. 59). From said decisions it is clear that the land here in question being then covered by the homestead entry was not subject to location at the time the asserted claim relied upon by Sullivan et al. was initiated and neither then nor

§ 22. Effect of Prior Discovery.

Where any such person has heretofore made such discovery, he shall be entitled to a lease thereon under such terms as the Secretary of the Interior may prescribe unless otherwise prescribed for in section 18 of the act: provided, that where such prospecting permit is granted upon land within any known geological structure of a producing oil or gas field, the royalty to be fixed in any lease thereafter granted thereon or any portion thereof shall be not less than $12\frac{1}{2}$ per centum of all the oil or gas produced except oil or gas used for production purposes on the claim, or unavoidably lost.²⁹

§ 23. Lands Reserved for Use of Navy.

The provisions of this section (19 of the act) shall not apply to lands reserved for the use of the Navy.³⁰

§ 24. Fraud.

No claimant of a permit or lease who has been guilty of any fraud or who had knowledge or reasonable grounds to know of any fraud, or who has not acted honestly and in good faith, shall be entitled to any of the benefits of this section of the act.³¹

§ 25. Legal Representatives.

All permits or leases hereunder shall inure to the benefit of the claimant and all persons claiming through or under him by lease, contract, or otherwise, as their interests may appear.³²

§ 26. Preference Rights to Surface Holder.

In the case of lands *bona fide* entered as agricultural, and not withdrawn or classified as mineral at the time of entry, but not including lands claimed under any railroad grant, the entryman or patentee, or assigns, where assignment was made prior to January 1, 1918, if the entry has been patented with the mineral right reserved, shall be entitled to a preference right to a permit and to a lease as in the act provided, in case of discovery; and within an area not greater than a township, such entryman and patentees, or assigns holding restricted patents may combine their holdings, not to exceed two thousand five hundred and sixty acres for the purpose of making joint application. Leases executed under this section (20 of the act) and embracing only

since has the tract been opened to the inception or completion of location rights pursuant to the mining law. Therefore, such attempted location, as to said tract, affords no basis for a permit under section 19 of the Leasing Act because lacking the element of basic validity in addition to that of discovery, and constitutes no bar to the subsequent permit application of Tendolle." But the location of a mining claim, although coupled with mere possession and occupancy if unaccompanied by diligent prosecution of work leading to the discovery of mineral, are, in the absence of discovery, insufficient grounds for a lawful exclusion from the land of others who seek to make mineral discovery and development thereon. *Clark & Ohio Oil Co.*, 48 L. D. 630. See note 91, *infra*.

²⁹ 2 Supp. U. S. Comp. St. p. 1414, § 4640jj (§ 19). An application for a prospecting permit under section 13 once denied in connection with favorable action upon conflicting applications under section 19 will not be reinstated to the prejudice of the competing applicants, if the defeated applicant did not first seek his remedy under the original application by appeal or otherwise. *Haupt*, 48 L. D. 355.

³⁰ 2 Supp. U. S. Comp. St. p. 1414, § 4640jj.

³¹ *Id.* See *Love vs. Flahive*, 205 U. S. 195; *Jones vs. Hoover*, 144 Fed. 221.

³² 2 Supp. U. S. Comp. St. p. 1414, § 4640jj. See § 20, *supra*. The rights of an oil and gas prospecting permit under section 13 of the act, pass, on the death of the applicant, to the personal representatives in the same manner as does other personal property. *Haynes vs. Smith* (on petition), 50 L. D. 208.

lands so entered shall provide for the payment of a royalty of $12\frac{1}{2}$ per centum as to such areas within the permit as may not be included within the discovery lease to which the permittee is entitled under section 14 of the act.³³

³³ 2 Supp. U. S. Comp. St. p. 1414, § 46401jj (§ 20). The provisions of this section have no application to entries allowed at any time under the Stock-Raising Homestead Law. Johnson, 48 L. D. 353. An entryman whose entry has been allowed under the Enlarged Homestead Act, upon an application accompanied by the required showing and payment, filed previously to the inclusion by Executive order of the land within a petroleum reserve, is entitled to the exercise of the preference right privilege to an oil and gas prospecting permit accorded by said section 20, notwithstanding that the withdrawal was made prior to the allowance of the entry, and that the entry was allowed subject to the reservations of the act of July 17, 1914 (38 Stat. 509). Johnson, *supra*. See, also, Fletcher, 49 L. D. 204. The privilege of being preferred in the award of an oil and gas prospecting permit accorded by section 20 in favor of an entryman of lands *bona fide* entered as agricultural, and not being withdrawn or classified as mineral at the time of the entry, does not inure to the benefit of one who had only a settlement claim for surveyed public land at the date of the withdrawal. Fletcher (on petition), *supra*. The preference right granted by said section to one who had *bona fide* made an agricultural entry of lands not withdrawn or classified as mineral, to prospect for oil and gas attaches upon the filing of a completed application for a permit, accompanied by the required fees, and such right is not thereafter forfeited by the subsequent relinquishment of the basic entry prior to the actual issuance of the permit. The rule that an application to enter public land subject to entry, when accompanied by the requisite showing and fees, is equivalent to entry, applies with equal force to proper applications filed by qualified persons for permits to prospect for oil and gas on lands subject to exploration under said section. Heryford vs. Brown, 49 L. D. 248, citing and applying Conrad, 39 L. D. 432; Rippy vs. Snowden, 47 L. D. 321; Johnson, *supra*. See, also, Arouni vs. Vance, 48 L. D. 543.

When an entryman had not completed his final proof when the land was classified as valuable for oil, he is not therefore entitled to an unrestricted patent. However, he will be entitled, upon filing his consent to the reservation of the oil and gas to the government, to a preference right to a prospecting permit under section 20 of the act. It is settled law that land covered by an agricultural entry without a reservation of the oil and gas to the government can not be included in a prospecting permit, even to the entryman himself, so long as the entry subsists without such reservation. Since the entryman's consent to a mineral reservation must be given before he can exercise his preference right to a permit his qualifications must be determined as of the date that he files such consent. La Flame, 49 L. D. 324.

A vested equitable right to a patent for both the surface and mineral deposits in public land is not acquired until an entryman has done everything required by law toward earning title. Such a vested equitable title is necessary to deprive the Government of its right to classify entered lands as prospectively mineral. Payment of fees and commissions is a necessary act toward earning title. Martin, 49 L. D. 608; Terrell, 49 L. D. 671.

The preference in the award of an oil and gas prospecting permit accorded to a homestead entryman by section 20 of the act, over a prior applicant for a permit under section 13 of that act, is not affected by a pending contest against the entry where there is no charge that the entry was made with a view to acquiring the mineral deposits nor in bad faith for any purpose. Miller vs. Little, 50 L. D. 134.

A settlement claim under the homestead laws prior to the inclusion of the land within a petroleum withdrawal, which did not ripen into an entry until after the creation of the withdrawal, affords the entryman no basis for a preference right to an oil and gas prospecting permit under section 20 of the act. Haynes vs. Smith (on petition), *supra*.⁶²

Where a homestead entry, patented with reservation of the oil and gas by the United States, has been sold or transferred subsequent to January 1, 1918, the transferee does not acquire a preference right under section 20 of the act, to prospect for oil or gas upon the patented land, but having become the sole owner of the land, subject to the reservation contained in the patent, he may, in the absence of other sufficient objection, be granted a prospecting permit under section 13 of the Leasing Act. Watson, 48 L. D. 214.

In Otrin vs. Hawkins (48 L. D. 622), it was said: "The Department is unable to concede the correctness of the contention of Hawkins that the permit application of Otrin was erroneously received because at the date of its presentation the land was covered by the unrestricted homestead application of Andrews, for by section 12 (c) of the regulations of March 11, 1920, reprint as amended to October 29, 1920 (47 L. D. 437, 444, 445), issued under the Leasing Act, the right of a person to file a prospecting permit application for a tract covered by the unrestricted homestead entry of another is expressly recognized, subject, however, to a future amendment of the entry to be obtained in the manner provided for in said section, and to the exercise by the entryman of a preference right, if any, to a permit under the provisions of section 20 of the act. It is clear, therefore, that immediately upon the cancellation, by voluntary relinquishment or otherwise, of such an entry pending a permit application for the land adverse to the entryman, the rights of the permit applicant, all else being regular, would be superior and paramount to those of a junior homestead applicant for the same tract. On the other hand, neither a permit application nor a permit granted thereon, would of necessity preclude the allowance of a homestead entry upon the land, for by section 20 of the Leasing Act it is expressly provided that the Secretary of the Interior, in making a lease (with a view to which a permit application is filed) under said act, may in his discretion reserve to the United States the right to sell or otherwise dispose of the surface of the lands embraced within such lease under existing laws, in so far as the surface

§ 27. Terms and Conditions.

Leases executed under this section (20 of the act) and embracing only lands so entered shall provide for the payment of a royalty of not less than $12\frac{1}{2}$ per centum as to such areas within the permit as may not be included within the discovery lease to which the permittee is entitled to under section 14 of the act.³⁴

§ 28. Oil Shale.

The Secretary of the Interior is authorized to lease to any person or corporation qualified under the act any deposit of shale belonging to the United States and the surface of so much of the public lands containing such deposits, or land adjacent thereto, as may be required for the extraction and reduction of the leased minerals, under such

is not necessary for use of the lessee in extracting and removing deposits thereon. And by departmental instructions of October 6, 1920 (47 L. D. 474), it is directed that application to make nonmineral entry of lands outside of areas which have been designated as within the geological structures of producing oil and gas fields shall be received by local officers, and if in any case nonmineral entry shall be allowed on instructions from the commissioner, the same will be with a reservation of the oil or gas to the United States and subject to the rights of the permittee or lessee, as the case may be, to use so much of the surface of the land as is necessary in extracting and removing the mineral deposits without compensation to the nonmineral entryman for such use. But while the right of a nonmineral claimant to make entry of land covered by the prior prospecting permit application of another is thus clearly recognized both by the provisions of the Leasing Act and the regulations thereunder, such an entry could not affect the unrestricted and unhampered use of the land for prospecting and developing purposes under a permit or lease."

Where a claimant who is asserting rights under the placer mining laws to withdrawn oil- and gas-bearing lands, files concurrently an application for a preferential lease, together with a quitclaim deed, pursuant to the provisions of section 18 (2 Supp. U. S. Comp. St. p. 1411, § 4640*1*), and a request for a patent, it will be held that the claimant elected to accept the benefits conferred by the Leasing Act. Honolulu Con. Oil Co., 48 L. D. 303. A settlement claim made under the homestead laws prior to the inclusion of the land within a petroleum withdrawal, which did not ripen into an entry until after the creation of the withdrawal, affords the entryman no basis for a preference right to an oil and gas prospecting permit under § 20 of the act. Haynes vs. Smith, *supra*.⁽³²⁾ The act does not contemplate that an agricultural entry made after its approval shall constitute the basis of a preference right to a prospecting permit under § 20 thereof. Haupt, (47 L. D. 588). In this case, with a full knowledge of the policy of Congress as disclosed by the act, the claimant is shown to have gone upon the land March 2, 1920, and posted a notice of his intention to apply for a prospecting permit under § 13 of the act, and on March 5 to have made simultaneous filings in the local land office of an application for such permit and an application for homestead entry of the same lands, alleging in the homestead application that the land is essentially nonmineral, but evidently having in mind the assertion of a preference right to a permit under § 20 of the act, if for any reason his claim to a preference right under § 13 should be rejected. The claim for preference right, under § 20, was rejected, the entry not having been made prior to the date of the act. In Miller vs. Little, *supra*, it is said: "There is no express provision in section 20 of the Leasing Act, which requires that an entry be *maintained* according to the law under which it was made as a condition precedent to a preference right, the only requirement being that the entry be *made* in good faith. The entry was unanceled when the waiver (to reserve the oil and gas deposits to the United States pursuant to the act of July 17, 1914) was filed and the land thereupon became subject to disposal under section 20 of the Leasing Act."

Where an indemnity school selection was made for lands not withdrawn nor classified as mineral when selected, but which were afterwards approved with a reservation of the oil deposits to the United States, a transferee is entitled to preference right under section 20 of the act, if the state had completed the selection and made the transfer prior to January 1, 1918, notwithstanding that the approval was subsequent to that date. Miller and Lux vs. How, 49 L. D. 177. See, also, Wyoming vs. Fry and Doyle, 49 L. D. 564. An applicant for a prospecting permit under § 13 of the Leasing Act is not required to serve notice on the owner of lands patented to a railroad company with reservation of the oil and gas under the act of July 17, 1914, inasmuch as claimants of railroad grant lands are excepted by § 20 of the former act from the preference right to permits thereunder. Staunton & Lee Simonsen, 48 L. D. 175.

One who makes a surface entry under the act of July 17, 1914, for lands embraced at time of entry within a petroleum withdrawal is not entitled to a preference right to an oil and gas prospecting permit under this section.

Where under the laws of the state a mortgage merely is a lien upon the property mortgaged, a mortgagee who purchases at foreclosure sale a homestead covered by his mortgage is not, prior to such purchase, entitled to claim as an assignee within the purview of said section. Schneider vs. Forster, 49 L. D. 610.

³⁴ 2 Supp. U. S. Comp. St. p. 1414, § 4640*1*ff (§ 20).

rules and regulations, not inconsistent with the act, as he may prescribe.³⁵

§ 29. Extent of Area.

No lease for oil shale lands shall exceed five thousand one hundred and twenty acres of land, to be described by the legal subdivisions of the public land surveys, or if unsurveyed by the United States, to be surveyed by the United States, at the expense of the applicant, in accordance with regulations to be prescribed by the Secretary of the Interior.³⁶

§ 30. Term of Lease.

Leases for oil shale lands may be for indeterminate periods, upon such conditions as may be imposed by the Secretary of the Interior including covenants relative to the methods of mining, prevention of waste, and productive development.³⁷

§ 31. Royalty.

For the privilege of mining, extracting, and disposing of the oil or other minerals covered by a lease under this section (21 of the act) the lessee shall pay to the United States such royalties as shall be specified in the lease and an annual rental payable at the beginning of each year, at the rate of fifty cents per acre per annum, for the lands included in the lease, the rental paid for any one year to be credited against the royalties accruing for that year: such royalties to be subject to readjustment at the end of each twenty-year period by said Secretary.³⁸

§ 32. Waiver of Royalties and Rental.

For the purpose of encouraging the production of petroleum products from shales the Secretary may, in his discretion, waive the payment of any royalty and rental during the first five years of any lease.³⁹

§ 33. Preference Right in Oil Shale Lands.

Any person having a valid claim to such minerals under existing laws on January 1, 1919, shall, upon the relinquishment of such claim, be entitled to a lease under the provisions of this section (21 of the act) for such area of the land relinquished as shall not exceed the maximum area authorized by said section to be leased to an individual or corporation.⁴⁰

³⁵ 2 Supp. U. S. Comp. St. p. 1414, § 4640½k (§ 21). See § 79, *infra*. Oil shale having been recognized by the Land Department and by Congress as a mineral deposit and a source of petroleum, and having been demonstrated elsewhere to be a material of economic importance, lands valuable on account thereof must be held to have been subject to valid location and appropriation under the placer mining laws, to the same extent and subject to the same provisions and conditions as if valuable on account of oil or gas. Entries and applications for patent for oil shale placer claims will, therefore, be adjudicated within the said department in accordance with the same legal provisions and with reference to the same requirements and limitations as are applicable to oil and gas placers. Instructions, 47 L. D. 548; *Utah vs. Watson Oil Co.*, 50 L. D. 323.

³⁷ *Id.* See section 35, *infra*.

³⁸ *Id.*

³⁹ *Id.*

⁴⁰ *Id.* See *Utah vs. Watson*, *supra*.⁽³⁵⁾

§ 34. Fraud.

No claimant for a lease who has been guilty of any fraud or who had knowledge or reasonable grounds to know of any fraud, or who has not acted honestly and in good faith shall be entitled to any of the benefits of said section.⁴¹

§ 35. Limitations.

Not more than one lease shall be granted under said section to any one person, association or corporation.⁴²

§ 36. Limitation on Number of Leases to One Person.

No person, association, or corporation, except as provided in the act, shall take or hold at one time, more than three oil or gas leases, granted thereunder in any one state, and not more than one lease within the geological structure of the same producing oil or gas field.⁴³

§ 37. Corporations.

No corporation shall hold any interest as a stockholder of another corporation in more than such number of leases; and no person or corporation shall take or hold any interest or interests as a member of an association or associations or as a stockholder of a corporation or corporations holding a lease under the provisions of the act, which, together with the area embraced in any direct holding of a lease under this act, or which, together with any other interest or interests, as a member of an association or associations or as a stockholder of a corporation or corporations holding a lease under the provisions of the act, for any kind of mineral leased under the provisions of the act, exceeds in the aggregate an amount equivalent to the maximum number of acres of the respective kinds of mineral allowed to any one lessee under this act.⁴⁴

§ 38. Forfeiture.

Any interests held in violation of the act shall be forfeited to the United States by appropriate proceedings instituted by the attorney general for that purpose in the United States district court for the district within which the property, or some part thereof, is located.⁴⁵

§ 39. Exceptions.

Any ownership or interest forbidden in the act which may be acquired by descent, will, judgment, or decree may be held for two years and not longer after its acquisition.⁴⁶

⁴¹ 2 Supp. U. S. Comp. St. p. 1414, § 4640½k (§ 21). See note 31, *supra*.

⁴² *Id.* See § 36, *infra*. The limitation contained in section 21 of the act relating to the deposits of oil shale belonging to the United States prevents a lessee thereunder from taking and holding directly more than one lease, irrespective of whether the leased area is one state or another. The limitations contained in section 27 of said act in respect to any kind of mineral leased under that act, are applicable to an oil shale lease, and consequently no person or corporation can take and hold, either directly or indirectly, any interest or interests in oil shale deposits in an area or areas exceeding in the aggregate the equivalent of five thousand one hundred and twenty acres. Limitations Respecting the Leasing of Oil Shale Deposits. 43 L. D. 635. For regulations concerning oil shale leases, see 47 L. D. 424.

⁴³ 2 Supp. U. S. St. p. 1417, § 4640½n (§ 27). See *supra*, § 35.

⁴⁴ *Id.*

⁴⁵ *Id.* See § 46, *infra*.

⁴⁶ *Id.*

§ 40. Lawful Combinations.

Nothing contained in the act shall be construed to limit sections 18,⁴⁷ 18a,⁴⁸ 19,⁴⁹ and 22⁵⁰ of the act or to prevent any number of lessees under the provisions of the act from combining their several interests so far as may be necessary for the purposes of constructing and carrying on the business of a refinery, or of establishing and constructing as a common carrier a pipe line, or lines of railroads to be operated and used by them jointly in the transportation of oil from their several wells, or from the wells of other lessees under the act.⁵¹

§ 41. Approval of Combination.

Any combination for such purpose or purposes shall be subject to the approval of the Secretary of the Interior on application to him for permission to form the same.⁵²

§ 42. Unlawful Combinations.

If any of the lands or deposits leased under the provisions of the act shall be subleased, trusteeed, possessed, or controlled by any device permanently, temporarily, directly, indirectly, tacitly, or in any manner whatsoever, so that they form a part of, or in any wise controlled by any combination in the form of an unlawful trust, with consent of lessee, or form the subject of any contract or conspiracy in restraint of trade in the mining or selling of oil, oil shale or gas entered into by the lessee, or any agreement or understanding, written, verbal or otherwise to which such lessee shall be a party, of which his or its output is to be or become the subject to control the price or prices thereof or of any holding of such lands by any individual, partnership, association, corporation or control in excess of the amounts of lands provided in the act, the lease shall be forfeited by appropriate court proceedings.⁵³

§ 43. Rights of Way for Pipe Lines.

Rights of way through the public lands, including the forest reserves, of the United States are granted by the act for pipe line purposes for the transportation of oil or natural gas to any applicant possessing the qualifications provided in section 1 of the act⁵⁴ to the extent of the ground occupied by said pipe line and twenty-five feet on each side of the same under such regulations as to survey, location, application, and use as may be prescribed by the Secretary of the Interior and upon the express condition that such pipe lines shall be constructed, operated, and maintained as common carriers.⁵⁵

§ 44. Reservations and Conditions.

The act provides that the government shall in express terms reserve and shall provide in every lease of oil lands under the act that the

⁵² *Id.*

⁵³ *Id.*

⁵⁴ 2 Supp. U. S. Comp. St. p. 1418, § 4640*½nn* (§ 28).

⁵⁵ *Id.*

lessee, assignee, or beneficiary, if owner, or operator or owner of a controlling interest in any pipe line or of any company operating the same which may be operated accessible to the oil derived from lands under such lease, shall at reasonable rates and without discrimination accept and convey the oil of the government or of any citizen or company not the owner of any pipe line, operating a lease or purchasing gas or oil under the provisions of the act.⁵⁶

§ 45. Limitation of Grant of Right of Way.

No right of way shall hereafter be granted over said lands for the transportation of oil or natural gas except under and subject to the provisions, limitations, and conditions of section 28 of the act.⁵⁷

§ 46. Forfeiture of Pipe Line Rights.

Failure to comply with the provisions of section 28 of the act or the regulations prescribed by the Secretary of the Interior shall be ground for forfeiture of the grant by the United States district court for the district in which the property, or some part thereof, is located in an appropriate proceeding.⁵⁸

§ 47. Reservation of Easements.

Any permit, lease, occupation, or use permitted under the act shall reserve to the Secretary of the Interior the right to permit upon such terms as he may determine to be just, for joint or several use, such easements or rights of way, including easements in tunnels upon, through, or in the lands leased, occupied or used as may be necessary or appropriate to the working of the same, or of other lands containing the deposits described in the act, and the treatment and shipment of the products thereof by or under authority of the government, its lessees, or permittees, and for other public purposes.⁵⁹

§ 48. Disposal of Surface Land.

The Secretary of the Interior, in his discretion, in making any lease under the act, may reserve to the United States the right to lease, sell, or otherwise dispose of the surface of the lands embraced in such lease under existing law or laws hereafter enacted, in so far as said surface is not necessary for the use of the lessee in extracting and removing the deposits therein.⁶⁰

⁵⁶ 2 Supp. U. S. Comp. St. p. 1418, § 4640½nn (§ 28).

⁵⁷ *Id.*

⁵⁸ *Id.* See § 38, *supra*.

⁵⁹ 2 Supp. U. S. Comp. St. p. 1418, § 4640½o (§ 29).

⁶⁰ *Id.* In the case of Brennan, *supra*,⁽¹⁾ the Land Department held that lands embraced in a prospecting permit must be treated as valuable for oil and gas, although not within a designated oil or gas field; and applications to make homestead entries filed subsequent to the permit application must be made with a reservation of the oil and gas deposits under the act of July 17, 1914 (38 Stat. 509), and subject to the permittee's full right to develop the land without hindrance or liability to the entryman. Such also is the provision made in departmental instructions of October 6, 1920 (47 L. D. 474). This requirement is in the exercise of the discretionary power granted the Secretary of the Interior in the above subdivision of the Leasing Act. The only disposition which may be made of the surface of lands under lease, or under a prospecting permit which gives a right to a lease, is such disposal, under existing nonmineral land laws, as will preserve to the lessee, or permittee, free use of the surface in any manner necessary to the fullest compliance with his lease or permit. Such rights are reserved by the act of July 17, 1914, *supra*, in the expressed reservation of the right to prospect for, mine and remove the reserved deposits. The waiver of compensation required is not an alteration or enlargement of the terms of the said act, as the only provisions requiring reimbursement of an entryman for damage to his crops and improvements appear in section 2 of said act, and clearly relate to

§ 49. Determination of Reservation.

If such reservation is made it shall be so determined before the offering of such lease.⁶¹

§ 50. Issuance of Permits for Easements.

The Secretary of the Interior is authorized to issue such permits for easements provided under the act to be reserved.⁶²

§ 51. Assignment And Subletting.

No lease issued under the authority of the act shall be assigned nor sublet except with the consent of the Secretary of the Interior.⁶³

§ 52. Relinquishment of Rights.

The lessee may, in the discretion of the Secretary of the Interior, be permitted at any time to make written relinquishment of all rights under such a lease, and upon acceptance thereof be thereby relieved of all future obligations under said lease, and may with like consent surrender any legal subdivision of the area included within the lease.⁶⁴

§ 53. Diligence, Skill, and Care.

Each lease shall contain provisions for the purpose of insuring the exercise of reasonable diligence, skill and care in the operation of said property.⁶⁵

§ 54. Safety and Welfare of Miners. Waste.

Each lease shall contain a provision that such rules for the safety and welfare of the miners and for the prevention of undue waste as

entrymen whose claims antedate the initiation of a right to prospect for minerals and to preexisting mineral entries. The practice of requiring an express waiver of claim to compensation for damage to the crops and improvements by a subsequent entryman merely is an administrative means of fully informing such entryman of the extent of his rights under said entry if it is allowed as authorized by the section of the Leasing Act. *Pace vs. Carstarphen*, 50 L. D. 369.

This subdivision of the Land Leasing Act modifies that portion of section 9 of the Stock Raising Act which requires compensation for damages to the crops and improvements of the entryman resultant from the prospecting for the reserved mineral deposits, as to stock raising homestead entries allowed pursuant to such subdivision. *Carlin vs. Cassriel*, 50 L. D. 383. A state selection for lands embraced within an oil and gas prospecting permit can not be allowed prior to the cancellation of the permit and notation of its cancellation upon the records of the local land office, except upon the consent of the selector to take subject to the provisions of the act of July 17, 1914 (38 Stat. 509), and to the right of the permittee to the use of the surface in accordance with the provisions of section 29 of the act of February 25, 1920. *New Mexico vs. Weed*, *supra*.⁽¹⁵⁾

⁶¹ 2 Supp. U. S. Comp. St. p. 1418, § 4640¹⁰ (§ 29).

⁶² *Id.*

⁶³ 2 Supp. U. S. Comp. St. p. 1419, § 4640¹⁰⁰ (§ 30). See *Hopkins*, *supra*.⁽¹²⁾

⁶⁴ *Id.* The purchase of a relinquishment, together with the improvements of one who has made an unrestricted homestead entry, does not vest in the purchaser any rights that will interfere with the allowance of an oil and gas prospecting permit under section 13, pursuant to an application that was pending when the relinquishment was executed. A purchaser of a relinquishment executed during the pendency of an oil and gas prospecting permit application by one who made an unrestricted homestead entry only, and then only upon his consenting to the use by the permittee of so much of the surface of the land without compensation to the nonmineral entryman as shall be needed in extracting and removing the mineral deposits.

Relinquishments of entries run only to the United States and any payment by a third party for the relinquishment and the improvements on the land do not vest any rights in the purchaser. *Musolf vs. Cowgill*, 49 L. D. 186.

A relinquishment of an oil and gas prospecting permit does not, of its own force, relieve the lands from the segregative effect created by the permit, and the filing of an application for a permit, predicated upon the relinquishment, prior to the cancellation of the permit by the Commissioner of the General Land Office, and notation thereof upon the records of the local land office, does not confer upon the applicant any right to notice of the disposition of the prior existing claim, nor entitle him to any preference in the allowance of his application when the lands formally are restored. *Craig*, *supra*.⁽¹⁵⁾

⁶⁵ *Id.*

may be prescribed by said Secretary shall be observed, including a restriction of the workday to not exceed eight hours in any one day for underground workers except in case of emergency. Also a provision securing the workmen complete freedom of purchase. Also a provision requiring the payment of wages at least twice a month in lawful money of the United States.⁶⁶

§ 55. Prohibiting the Employment of Minors and Females.

Each lease shall contain provisions prohibiting the employment of any boy under the age of sixteen or the employment of any girl or woman without regard to age in any mine below the surface.⁶⁷

§ 56. Prevention of Monopoly.

Each lease may contain such other provisions as the Secretary of the Interior may deem necessary to insure the sale of the production of such leased lands to the United States and to the public at reasonable prices, for the protection of the interests of the United States, for the prevention of monopoly, and for the safeguarding of the public welfare.⁶⁸

§ 57. State Laws.

None of the provisions in such lease shall be in conflict with the laws of the State within which the leased property is situated.⁶⁹

§ 58. Forfeiture or Cancellation of Leases.

Any lease issued under the provisions of the act may be forfeited and cancelled by an appropriate proceeding in the United States district court for the district in which the property, or some part thereof, is located whenever the lessee fails to comply with any of the provisions of the act, of the lease, or of the general regulations promulgated under the act and in force at the date of the lease; and the lease may provide for resort to appropriate methods for the settlement of disputes or for remedies for breach of specified conditions thereof.⁷⁰

§ 59. Rules and Regulations.

The Secretary of the Interior is authorized to prescribe necessary and proper rules and regulations and to do any and all things necessary to carry out and accomplish the purposes of the act.⁷¹

⁶⁶ 2 Supp. U. S. Comp. St. p. 1419, § 4640¹oo (§ 30).

⁶⁷ Id.

⁶⁸ Id.

⁶⁹ Id.

⁷⁰ 2 Supp. U. S. Comp. St. p. 1419, § 4640¹p (§ 31). The provision to the effect that an oil and gas lease may provide for the resort to appropriate methods for the settlement of disputes or for remedies for breach of specific conditions thereof, has particular reference to issues arising between the lessor and the lessee, but disputed questions relating to the disposition of proceeds accruing from drilling operations and remaining after the payment of royalties to the United States, come exclusively within the jurisdiction of the courts. *Heirs of Baker vs. Central Wyoming Co.* (on petition), 49 L. D. 634. The courts, not the Land Department, have jurisdiction to determine questions pertaining to actual physical possession of lands in cases arising from conflicts between claimants under the acts of July 17, 1914 (Stock-Raising Homestead Act) (38 Stat. 509), and February 25, 1920 (Leasing Act) (2 Supp. U. S. Comp. St. p. 1404, § 4640¹ et seq.).

⁷¹ 2 Supp. Comp. St. p. 1420, § 4640¹pp (§ 32). It is the policy of the Land Department to allow claimants of public land opportunity to be heard, notwithstanding they may have, through mistake, inadvertence, or even laches, clearly forfeited their right to a hearing under the Rules of Practice, unless it appears from the record, with reasonable clearness, that they have no substantial claims to equitable consideration. *Cassidy vs. Hall*, 50 L. D. 363; but see *Bojorques vs. Heilm*, 50 L. D. 165.

§ 60. Boundary Lines.

The Secretary of the Interior is authorized to fix and determine the boundary lines of any structure, or oil or gas field, for the purposes of the act.⁷²

§ 61. State Rights.

Nothing in the act shall be construed or held to effect the rights of the state or other local authority to exercise any rights which they may have, including the right to levy and collect taxes upon improvements, output or mines, or other rights, property, or assets of any lessee of the United States.⁷³

§ 62. Verifications.

All statements, representations, or reports required by the Secretary of the Interior under the act shall be upon oath, unless otherwise specified by him, and in such form and upon such blanks as he may require.⁷⁴

§ 63. Reserved Deposits.

The provisions of the act apply to all deposits of oil, oil shale, or gas in the lands of the United States, which lands have been or may be disposed of under laws reserving to the United States such deposits with the right to prospect for, mine and remove the same, subject to such conditions as are or may hereafter be provided by such laws reserving such deposits.⁷⁵

§ 64. Disposition of Moneys Received.

Ten per centum of all money received from sale, bonuses, royalties, and rentals under the provisions of the act, excepting those from Alaska, shall be paid into the treasury of the United States and credited to miscellaneous receipts; for the past production 70 per centum, and from future production 52½ per centum of the amounts derived from such bonuses, royalties, and rentals shall be paid into, reserved, and appropriated as a part of the reclamation fund created by the act of congress, known as the Reclamation Act, approved June 17, 1902, and for the past production 20 per centum and for future production 37½ per centum of the amounts derived from such bonuses, royalties and rentals shall be paid by the Secretary of the Treasury after the expiration of each fiscal year to the state within the boundaries of which the leased lands or deposits are or were located.⁷⁶

§ 65. Expenditures by State.

Said moneys to be used by such state or subdivision thereof for the construction and maintenance of public roads or for the support of public schools or other public educational institutions, as the legislature of the state may direct.⁷⁷

⁷² 2 Supp. Comp. St. p. 1420, § 46401pp (§ 32). See note 43, *infra*.

⁷³ *Id.* For a construction of this provision as to state rights, see *Mid-Northern Oil Co. vs. Walker*, 65 Mont. 414, 211 Pac. 353.

⁷⁴ 2 Supp. U. S. Comp. St. p. 1420, § 46401q (§ 33).

⁷⁵ 2 Supp. U. S. Comp. St. p. 1420, § 46403qq (§ 34).

⁷⁶ 2 Supp. U. S. Comp. St. p. 14201r (§ 35).

⁷⁷ *Id.*

§ 66. Miscellaneous Receipts.

All moneys which may accrue to the United States under the provisions of the act from lands within the naval petroleum reserves shall be deposited in the treasury as "miscellaneous receipts."⁷⁸

§ 67. Royalty Payable in Kind on Demand.

All royalty accruing to the United States under any oil or gas lease, or permit under the act on demand of the Secretary of the Interior shall be paid in oil or gas.⁷⁹

§ 68. Advertising Sales of Royalty Oil and Gas.

Upon granting any oil or gas lease, under the act, and from time to time thereafter, during said lease, the Secretary of the Interior shall, except whenever in his judgment it is desirable to retain the same for the use of the United States, offer for sale for such period as he may determine, upon notice and advertisement on sealed bids or at public auction, all royalty oil and gas accruing or reserved to the United States under such lease.⁸⁰

§ 69. Rejection of Bids.

Such advertisement and sale shall reserve to the Secretary of the Interior the right to reject all bids whenever within his judgment the interest of the United States demands.⁸¹

§ 70. Readvertising. Private Sale.

In cases where no satisfactory bid is received or where the accepted bidder fails to complete the purchase, or where the said secretary shall determine that it is unwise in the public interest to accept the offer of the highest bidder, the said secretary, within his discretion, may readvertise such royalty for sale, or sell at private sale at not less than the market price for such period, or accept the value thereof from the lessee. Pending the making of a permanent contract for the sale of any royalty, oil or gas as herein provided, the said secretary may sell the current product at private sale, at not less than the market price.⁸²

§ 71. Sale to United States Departments or Agencies.

Any royalty, oil or gas may be sold at not less than the market price at private sale to any department or agency of the United States.⁸³

ALASKA OIL PROVISIO.

[§ 72-§ 78, inclusive.]

§ 72. Prospecting Permits.

In the Territory of Alaska prospecting permits not more than five in number may be granted to any qualified applicant for periods not exceeding four years, actual drilling operations shall begin within two years from date of permit, and oil and gas wells shall be drilled

⁷⁸ 2 Supp. U. S. Comp. St. p. 12403r (§ 35).

⁷⁹ 2 Supp. U. S. Comp. St. p. 1421, § 46403rr (§ 36).

⁸⁰ Id.

⁸² Id.

⁸³ Id.

to a depth of not less than five hundred feet, unless payable deposits of oil or gas shall be sooner discovered, within three years from date of permit and to an aggregate depth of not less than two thousand feet unless valuable deposits of oil or gas shall be sooner discovered, within four years from date of permit.⁸⁴

§ 73. Preference Right.

In said territory the applicant shall have a preference right over others to a permit for land identified by temporary monuments and notice posted on or near the same for six months following such marking and posting, and upon receiving a permit he shall mark the corners of the tract described in the permit upon the ground with substantial monuments within one year after receiving such permit.⁸⁵

§ 74. Prospecting Permits or Leases on Withdrawn Lands.

Any *bona fide* occupant or claimant of oil or gas-bearing lands within the Territory of Alaska, who, or whose predecessors in interest prior to withdrawal had complied otherwise with the requirements of the mining laws, but had made no discovery of oil or gas in wells and who prior to withdrawal had made no substantial improvements for the discovery of oil or gas on or for each location or had prior to the passage of this act expended not less than two hundred and fifty dollars in improvements on or for each location shall be entitled, upon relinquishment or surrender to the United States within one year from the date of the act, or within six months after final denial or withdrawal of application for patent, to a prospecting permit or permits, lease or leases, under this act covering such lands, not exceeding five permits or leases in number and not exceeding an aggregate of one thousand two hundred and eighty acres in each.⁸⁶

§ 75. Rental and Royalties.

Leases in Alaska under the act whether as a result of prospecting permits or otherwise shall be upon such rental and royalties as shall

⁸⁴ 2 Supp. U. S. Comp. St. p. 1410, § 4640*4g* (§ 13).

⁸⁵ *Id.* For regulations relating to the exceptionally liberal provisions with respect to Alaska, see Oil Prospecting Permits in Alaska, 48 L. D. 46. For regulations governing oil and gas permits in Alaska under the act, see 49 L. D. 207, 801. For extension of time for drilling operations, see 2 Supp. U. S. Comp. St. p. 1410, § 4640*fff* (act of Jan. 11, 1922, c. 28); Oil and Gas Permits, 49 L. D. 110. For extension to the Territory of Alaska of the principles of the surface homestead acts already in force in the public land states, namely, the acts of March 3, 1909 (35 Stat. 844), June 22, 1910 (36 Stat. 583), and July 17, 1914 (38 Stat. 509), see act of March 8, 1922 (42 Stat. 415), entitled "An act to provide for agricultural entries on coal lands in Alaska." This act provides that, upon the unreserved withdrawn public lands in the Territory of Alaska, homestead claims may be initiated by actual settlers on public lands which are known to contain workable coal, oil, or gas deposits, or which may be, in fact, valuable for the coal, oil or gas contained therein. Thus, by the class last named, provision is made for cases in which land is not at the date of the initiation of the claim thereto actually known to contain workable coal, oil, or gas deposits, but in which it becomes known, during the interval between the initiation of the claim and its completion, that the land is, in fact, valuable for the coal, oil or gas contained therein. It also provides that homestead claims so initiated may be perfected under the appropriate public land laws and that, upon satisfactory proof of full compliance with these laws, the claimant shall be entitled to patent for the lands entered by him, which patent shall contain a reservation to the United States of all the coal, oil or gas in the land patented, together with the right to prospect for, mine, and remove the same.

For instructions relating to the acquisition of title to public lands in the Territory of Alaska, see 50 L. D. 27 and 96. See, also, Identification of Lands in Alaska, 50 L. D. 155.

⁸⁶ 2 Supp. U. S. Comp. St. p. 1415, § 4640*kk* (§22).

be fixed by the Secretary of the Interior and specified in the lease, and be subject to readjustment at the end of each twenty-year period of the lease.⁸⁷

§ 76. Waiver of Rental or Royalty.

For the purpose of encouraging the production of petroleum products in Alaska the Secretary may in his discretion, waive the payment of any rental or royalty not exceeding the first five years of any lease.⁸⁸

§ 77. Fraud.

No claimant for a lease who has been guilty of any fraud or who had any knowledge or reasonable grounds to know of any fraud, or who has not acted honestly and in good faith, shall be entitled to any of the benefits of this section (22 of the act).⁸⁹

§ 78. Disposition of Moneys Received.

The payment of 37½ per centum of the amounts derived from certain bonuses, royalties and rentals by the United States to the state within the boundaries of which leased lands or deposits are or were located does not extend to Alaska.⁹⁰

§ 79 Disposition of Oil, Oil Shale and Gas.

The deposits of oil, oil shale and gas referred to in the act, in lands valuable for such minerals, shall be subject except as to valid claims existent at the date of the passage of this act to disposition only in the form and manner provided for in said act and thereafter maintained in compliance with the laws under which initiated, which claims may be perfected under such laws, including discovery.⁹¹

⁸⁷ 2 Supp. U. S. Comp. St. p. 1415, § 4640½kk (§ 22).

⁸⁸ Id.

⁸⁹ Id. See note 31, *supra*.

⁹⁰ 2 Supp. U. S. Comp. St. p. 1420, § 4640½r (§ 35).

⁹¹ 2 Supp. U. S. Comp. St. p. 1421, § 4640½r (§ 37). The term "valid claims" as used in this section relates to unperfected claims to mineral lands. *Utah vs. Lichliter* (on rehearing), 50 L. D. 231. In view of said provisions, no oil placer mining claims can be passed to patent under the provisions of the placer mining laws unless (a) it shall be shown to have been supported at the date of the Leasing Act by a sufficient discovery; or (b) discovery being at that time absent, it shall be established that work leading to discovery was then being diligently prosecuted by or for the claimants thereof and thereafter diligently continued to discovery. See section 32 of the Land Office Regulations of March 11, 1920, as amended to October 29, 1920 (47 L. D. 462), issued under the Leasing Act. Nor, in the absence of a similar showing, can an unperfected oil placer mining claim not entitled to be made the basis for relief under the sections 18, 18a or 19 of the Leasing Act because of the filing of application for relief, be successfully set up to defeat an application for permit or lease under the act. *McGee vs. Wooten*, *supra*.⁽³⁵⁾ Valid claims for oil shale which were existent at the date of the Leasing Act and thereafter duly maintained, are excepted from the operation of that statute, and may be perfected under the laws under which the claims were initiated. *Utah vs. Watson Oil Co.*, *supra*.⁽³⁵⁾

In *Hodson vs. Midwest Oil Co.*, 297 Fed. 273, the court said: "The situation presented here also raises the same question which has been before this court in cases recently decided, as to whether or not the Interior Department has the exclusive jurisdiction under the act of February 25, 1920, to determine the matter of granting the leases to owners of placer mining claims upon application under that act. This court held in *Hodson vs. Mt. & Gulf Oil Co.*, 297 Fed. 269, that when the Department of the Interior has recognized the ownership of a Placer Mining Act claim for the purpose of granting a lease to the owner or owners of said claim, such action is final, unless set aside on account of fraud, jurisdictional irregularities, or errors of law upon which the decision was based. Even these cases could not be asserted in an action at law.

"It is asserted in the plaintiff's petition that the Federal Leasing Act is unconstitutional, in that it is in contravention of the 'due process' clause of the constitution. In this manner, by one sweeping averment in his petition, the plaintiff would wipe out the statute upon which rests the right of his opponent. * * * The contention in the petition seems to be that the legislation is retroactive in that it purports to affect property rights already vested, and counsel argues that the act itself in no way pro-

§ 80. Fees and Commissions.

Until otherwise provided, the Secretary of the Interior shall be authorized to prescribe fees and commissions to be paid registers and receivers of United States land offices on account of business transacted under the provisions of the act.⁹²

MISCELLANY.

§ 81. The Act of March 4, 1923—Oklahoma,

Providing for the disposition of oil and gas deposits in lands of the United States south of the medial line of Red River in Oklahoma did not contemplate the recognition of any equities asserted under the Leasing Act, but only those persons who were claiming and possessing lands within that area, in good faith, under color of some legal right, and had made *bona fide* expenditures in development of the lands for oil and gas with reasonable diligence prior to the passage of the Leasing Act, are entitled to equitable consideration.⁹³

§ 82. Trespass.

In *Mason vs. U. S.*⁹⁴ the court holds that the measure of damages for oil trespass is within the controlling scope of state legislation and the court stated: "Here, while the suit is one in equity, the statute and decisions relied upon have nothing to do with the general principles of equity jurisdiction, but simply establish a measure of damages applicable to actions at law and suits in equity. In consonance with that decision the Land Department has directed that in cases of oil trespasses on the public domain if there is no state law governing such trespasses, the measure of damages will be as follows: (1) Innocent trespass. Value of oil taken, less amount of expense

vides methods of giving notice to those parties claiming an interest in lands affected by the legislation.

"Whatever may be the character of right secured by a placer mining claimant, it is not that certain, indefeasible right which comes from a grant of title ownership, but depends at all times upon certain acts to be continuously performed by the claimant, the fee title remaining in the United States, unless the claimant proceed to patent. In the latter proceeding, rights in such a claim may be irrevocably cut off, in which the due process is based upon a published notice. *Golden Reward Co. vs. Buxton Co.*, 79 Fed. 868. While the Leasing Act itself does not provide for notice, it in effect gives the Interior Department the right to prescribe rules and regulations to carry the act into effect. Such rules and regulations were prescribed by the Land Department requiring notice to be given of all applications for leases, which regulations should be given full force and effect of statutes, when not inconsistent with nor repugnant to the law itself. *U. S. vs. Moorehead*, 243 U. S. 607; *Leonard vs. Lennox*, 181 Fed. 760; *Williamson vs. U. S.*, 207 U. S. 425.

"Plaintiff further contends that, being the owner of a claim maintained and perfected in accordance with the requirements of the Placer Mining Act, he and his locators have the absolute right to proceed under the provisions of that act in the maintenance and operation of the mining claim, as well as proceeding to patent thereunder, without interference through any provisions of the Leasing Act. This contention would undoubtedly be sound were it not that the Leasing Act, in section 37 (Comp. St. Ann. Supp. 1923, § 4640½s), apparently gives the option to such a claimant to proceed under either act. This seems to be the only practicable construction of section 37, which, if correct, gives the department the undoubted right under due process regulations to call before it any person or persons claiming an interest in an entry upon which a lease is sought. Upon such a hearing the rights of the parties can be fully determined." "Paper locations" of oil and gas lands unaccompanied by discovery therein are not within the excepting clause of this section although the annual assessment work has been performed each year thereon. *Mt. States Co. vs. Taylor*, 50 L. D. 348.

⁹² 2 Supp. U. S. Comp. St. p. 1321, § 4640½ss (§ 38).

⁹³ *Red River Syndicate* (on petition), 49 L. D. 669; see, also, *Oklahoma vs. Texas*, 258 U. S. 574; *Martin*, 48 L. D. 277. For rule establishing boundaries in accordance with the decision of the Supreme Court in the case of *Oklahoma vs. Texas*, see 50 L. D. 216.

⁹⁴ 260 U. S. 545; see *Central Co. vs. Penny*, 173 Fed. 340; *Instructions*, 49 L. D. 484.

incurred in taking the same. (2) Wilful trespass. Value of oil taken without credit or deduction for the expense incurred by the wrongdoers in getting it.

§ 83. Recorded Notice Ineffective.

The rules relating to notices of *lis pendens* that are applicable under a state law have no effect in land office proceedings and recordation in the office of the county recorder in which the lands are situate, of proceedings in a local land office, there being no statutory requirement to that effect, neither constitutes constructive notice nor raises a presumption of notice. Persons seeking information should go to the records of the Land Department to obtain it.⁹⁵

§ 84. Annual Assessment Work Within Withdrawn Areas.

A claimant to public land who has done all that is required under the law to perfect his title acquires rights against the government, and his right to a legal title is to be determined as of that time, on the theory that, by virtue of his compliance with the requirements, he has an equitable title to the land, and that the government holds it in trust for him.⁹⁶ But the possession of a mining claim where the statutory requirements have not been complied with is subject to be terminated by the government under some law of congress authorizing the disposal of the public lands.⁹⁷ In other words, if there was, at the time of the withdrawal, a valid claim, said claim is unaffected by the withdrawal so long as it is maintained in accordance with the law under which it was initiated.⁹⁸

It follows that a valid unpatented mining claim located before the passage of the Leasing Act, and containing mineral of the character enumerated in said act, must be kept alive by the performance of the annual assessment work, within the assessment year although, possibly, the commencement of such work on, say, the last day of such year and diligently prosecuting the same to completion within the succeeding year may prevent forfeiture;⁹⁹ or, by application for patent, within which

⁹⁵ Opinion, 50 L. D. 199. Where an application for a permit is filed in good faith for lands shown by the records of the local land office to be free from conflicting claims, such application constitutes a bar to the amendment of subsisting permit applications, although based upon location notices posted upon the land, if there were no apparent error in those applications when filed. A location notice, posted as prescribed by the act, has a segregative effect for a period of thirty days only, and when an application for a permit is filed the application becomes the notice to all applicants that the land described therein is adversely claimed and can not be amended after the expiration of the thirty-day period to conform to the description posted, in the presence of a *bona fide* intervening claim. Neither the act nor the Departmental Regulations issued pursuant thereto make distinction between surveyed and unsurveyed lands as to preference rights initiated under the provisions of the act by the posting of location notices, except that greater particularly is required in the description of lands of the latter class. *Wagner vs. Coffin, supra*.⁽¹⁵⁾

⁹⁶ *Payne vs. New Mexico, supra* ⁽¹²⁾; see, also, *Payne vs. C. P. R. Co., supra* ⁽¹²⁾; *Interstate Oil Corp., 50 L. D. 262*.

⁹⁷ *McKenzie vs. Moore, 20 Ariz., 176 Pac. 569*. Where a claimant is in default so that his claim could be defeated by another individual adverse claimant, surely the government, desiring to devote the land to an important public use, may likewise take advantage of the default and divest the claim so as to free the land for government use. *Kinney, 44 L. D. 580; Interstate Oil Corp., supra*.⁽¹⁶⁾

⁹⁸ *Interstate Oil Corp., supra* ⁽¹⁶⁾; see, also, *Robbins vs. Elk Basin Co., supra*.⁽¹⁵⁾

⁹⁹ *Willits vs. Baker, 133 Fed. 937*; see, also, *Anderson vs. Robinson, 63 Or. 228, 126 Pac. 988, 127 Pac. 546*. See, also, note 96, *supra*. The mere staking of a mining claim, posting and recording notice, and doing the annual assessment work thereon is not sufficient to confer title upon its claimant. *Union Oil Co. vs. Smith, 249 U. S. 337; Cole vs. Ralph, supra* ⁽¹⁾; *U. S. vs. Midway Northern Oil Co., supra* ⁽²⁾; *U. S. vs. Thirty-Two Oil Co., 736*. The annual assessment work upon oil lands may be done upon any one of a group of such claims or locations lying contiguous and owned by the same person or corporations not exceeding five claims in all; provided, that said labor will tend to the development or to determine the oil-bearing character of such contiguous claims. See *Smith vs. Union Oil Co., 166 Cal. 217, 135 Pac. 967*; affirmed in *Union Oil Co. vs. Smith, supra*.

final entry has been made.¹⁰⁰ Else the land embraced within the location will revert to the government. There can not be either resumption of work or relocation of such a mining claim.¹⁰¹

¹⁰⁰ Annual assessment work is not required to be made after the final entry in the local land office on the theory that the government parts with the property upon such entry, though the title remains in it until the patent in fact, is issued, as the right to the patent immediately arises upon payment of the price of the land and a mere delay in the administration of the Land Department will not defeat nor diminish the right of the purchaser. *Benson Co. vs. Alta Co.*, 145 U. S. 425; *Brown vs. Gurney*, 201 U. S. 184; *Neilson vs. Champagne Co.*, 111 Fed. 657; *Cranes Gulch Co. vs. Scherrer*, 134 Cal. 353, 66 Pac. 487; *Southern Cross Co. vs. Sexton*, 147 Cal. 758, 82 Pac. 483; *Batterton vs. Douglass Co.*, 20 Ida. 760, 120 Pac. 827.

¹⁰¹ See *U. S. vs. McCutchen*, *supra* ⁽²⁾; see, also, note 97, *supra*.

OIL AND GAS REGULATIONS.

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE,

Washington, D. C., March 11, 1920

REGISTERS AND RECEIVERS,

UNITED STATES LAND OFFICES.

SIRS: Under the authority of the act of congress approved February 25, 1920, entitled "An act to promote the mining of coal, phosphate, oil, oil shale, gas, and sodium on the public domain," the following rules and regulations are prescribed for the administration of the provisions of said act relative to oil and gas:

I. OIL AND GAS PERMITS.

Section 13 of the act authorizes the Secretary of the Interior to grant a qualified applicant the exclusive right to prospect for oil or gas for the period of two years, unless extended, and under authority thereof the following rules and regulations will govern the issuance of such permits:

1. **QUALIFICATIONS OF APPLICANTS.**—Pursuant to section 1 of the act, permits may be issued to (a) a citizen of the United States; (b) an association of such citizens; (c) a corporation organized under the laws of the United States or of any state or territory thereof; or (d) a municipality.

2. **LANDS TO WHICH APPLICABLE.**—The permit thus issued may include not more than 2560 acres of land wherein such deposits belong to the United States and are not within any known geological structure of a producing oil or gas field, the lands applied for to be taken in a reasonably compact form, by legal subdivisions if surveyed, and in an approximately square or rectangular tract if unsurveyed, the length of which must not exceed two and one-half times its width. Incontiguous tracts within a limited radius may be included in a permit when conditions are such that, because of prior disposals, a reasonable area of contiguous land can not be procured. Such permits may not include land or deposits in (a) national parks; (b) forests created under the act of March 1, 1911 (36 Stat., 961), known as the Appalachian Forest Reserve act; (c) lands in military or naval reservations; or (d) Indian reservations. The application of the act to ceded Indian lands depends on the laws controlling their disposition.

See Harrison, 49 L. D. 139; Instructions 49 L. D. 431.

All permits or leases for the exploration for or development of oil or gas deposits under this act within the limits of national forests or other reservations or withdrawals to which this act is applicable shall be subject to and contain such conditions, stipulations, and reservations as the Secretary of the Interior shall deem necessary for the protection of such forests, reservations, or withdrawals, and the uses and purposes for which created.

The boundaries of the geological structures of producing oil or gas fields will be determined by the United States Geological Survey, under the supervision of the Secretary of the Interior, and maps or diagrams showing same will be placed on file in local United States land offices.

It should be understood that under the act, the granting of a prospecting permit for oil and gas is discretionary with the Secretary of the Interior, and any application may be granted or denied, either in part or in its entirety, as the facts may be deemed to warrant.

3. PERMITS OR LEASES FOR OTHER MATERIALS.—The granting of a permit or lease for the development or production of oil or gas will not preclude other permits or leases of the same land for the mining of other minerals, under this act, with suitable stipulations for such joint operation, to the end that the full development of the mineral resources may be secured, nor will it necessarily preclude the allowance of applicable entries, locations, or selections of the lands included therein with a reservation of the mineral deposits to the United States.

4. FORM AND CONTENTS OF APPLICATION.—Applications for permits should be filed in the proper district land office, addressed to the Commissioner of the General Land Office, be suspended for thirty days to enable preference-right claims to be presented before action, and after due notation then forwarded for his consideration, with a full report as to status and conflicts. No specific form of application is required, and no blanks will be furnished, but it should cover, in substance, the following points, and be under oath:

(a) Applicant's name and address.

(b) Proof of citizenship of applicant, by affidavit of such fact, if native born; or if naturalized, by a certified copy of the certificate of naturalization on the form provided for use in public-land matters, unless such a copy is already on file; if a corporation, by certified copy of the articles of incorporation, and a showing as to the residence and citizenship of its stockholders; if a municipality a showing of (1) the law or charter and procedure taken by which it has become a legal body corporate; (2) that the taking of a permit or lease is authorized under such law or charter; and (3) that the action proposed has been duly authorized by the governing body of such municipality.

(c) A statement that the applicant is not the holder of more than two other subsisting permits in the same state, nor of any permit in the same geologic structure, together with a statement of any other applications for permits in the same state, in which the applicant is directly or indirectly interested, fully disclosing the nature and extent of such interests. In this connection attention is directed to the limitations and exceptions of section 27 of the act.

(d) Description of the land for which the permit is desired, by legal subdivisions if surveyed, and by metes and bounds if unsurveyed, in which latter case, if deemed necessary, a survey sufficient more fully to identify the land may be required before the permit is granted. In order to properly identify unsurveyed lands, great care should be taken, and if practicable the metes and bounds descrip-

tion should be connected by course and distance with some corner of the public land surveys.

(e) A statement that to the best of applicant's knowledge and belief the land applied for is not within any known geological structure of a producing oil or gas field.

(f) Three references as to applicant's reputation and business standing.

(g) If the applicant is claiming a preference right as explained in the next succeeding section of these regulations, he should set up fully the facts upon which such preference right is based, together with a true copy of the posted notice.

(h) The applicant must furnish a bond, with qualified corporate surety, in the sum of \$1,000, conditioned against the failure of the permittee to repair promptly, so far as possible, any damage to the oil strata or deposits resulting from improper methods of operation. The penalty of the bond may be increased by the Secretary of the Interior when conditions warrant, particularly in relief cases. This bond may be filed with the application, which will expedite action thereon, or within ten days after receipt of notice by the applicant that the permit will be granted when the bond is filed.

Additional bonds, or a bond with additional obligations therein, will be required in special cases where a permit embraces reserved deposits in lands theretofore entered or patented with a reservation of the oil and gas to the United States, together with a right to prospect for, mine, and remove the same pursuant to the act of July 17, 1914 (38 Stat., 509), or where the lands constitute a portion of a reclamation project.

See Craig, 50 L. D. 202.

A revenue stamp must be attached to the bond at the rate of 1 cent on each \$1 or fractional part thereof of premium paid.

The following form of bond is prescribed for use in ordinary cases in connection with applications for permit:

BOND.

DEPARTMENT OF THE INTERIOR.

GENERAL LAND OFFICE.

U. S. Land Office-----
Serial Number-----

Bond of oil and gas permittee.

[Act of February 25, 1920 (Public No. 146).]

Know all men by these presents, That we, -----, of the county of -----, in the State of -----, as principal, and ----- of the county of -----, in the State of -----, as surety, are held and firmly bound unto the United States of America in the sum of ----- dollars, lawful money of the United States to be paid to the United States, for which payment, well and truly to be made, we bind ourselves, and each of us, and each of our heirs, executors, administrators or successors, and assigns, jointly and severally by these presents.

Signed with our hands and sealed with our seals this ----- day of ----- in the year of our Lord one thousand nine hundred and -----.

The condition of the foregoing obligation is such that, whereas the said principal has made application under the act of February 25, 1920 (Public No. 146), for a permit to prospect for oil and gas for two years upon the following described lands -----; and whereas said permit, if granted, will be on condition that all operations shall be conducted in accordance with approved methods; that all proper

precautions shall be exercised to prevent waste of oil or gas developed in the lands, or the entrance of water through wells drilled by, or on behalf of, the principal to the oil sands or oil-bearing strata to the destruction of the oil deposits.

Now therefore, if said principal shall promptly repair any damage that may result to the oil strata or deposits resulting from improper methods of operation, or from failure to comply fully with the aforesaid conditions of said permit, then the above obligation is to be void and of no effect; otherwise to remain in full force and virtue.

Signed, sealed, and delivered in presence of

Name and address of witness:

----- [L. S.]

Principal.

----- [L. S.]

Surety.

In lieu of corporate surety, the applicant may deposit United States bonds of the par value of not less than \$1,000, pursuant to section 1320 of the act of February 24, 1919 (see Treasury Circular No. 154, of June 30, 1919). When United States bonds are submitted as security in lieu of corporate surety same should be accompanied with a bond and power of sale duly executed by the applicant in substantially the following form:

BOND.

DEPARTMENT OF THE INTERIOR.

GENERAL LAND OFFICE.

U. S. Land Office-----

Serial Number-----

Bond of oil and gas permittee where United States bonds are accepted in lieu of surety or surties, and power of attorney.

[Act of February 25, 1920 (Public No. 146).]

Know all men by these presents, That ----- of -----, State of -----, as obligor, is held and firmly bound unto the United States of America in the sum of \$1,000, lawful money of the United States, to be paid to the United States, for which payment, well and truly to be made, binds himself, his heirs, executors, administrators, and assigns by these presents.

The condition of the foregoing obligation is such that whereas the said obligor has made application under the act of February 25, 1920 (Public No. 146), for a permit to prospect for oil and gas for two years upon the following described land: -----; and

Whereas said permit, if granted, will be on condition that all operations shall be conducted in accordance with approved methods; that all proper precautions shall be exercised to prevent waste of oil or gas developed in the lands, or the entrance of water through wells drilled by or on behalf of the obligor to the oil sands or oil-bearing strata to the destruction of the oil deposits.

Now, therefore, if said obligor shall promptly repair any damage that may result to the oil strata or deposits resulting from improper methods of operation, or through failure to comply fully with the aforesaid conditions of said permit, then the above obligation is to be void and of no effect; otherwise to remain in full force and virtue.

The above-bounden obligor, in order the more fully to secure the United States in the payment of the aforesaid mentioned sum, hereby pledges as security therefor bonds of the United States in the principal sum of \$1,000, which said bonds are numbered serially and are in the denominations and amounts and are otherwise more particularly described as follows:

----- bonds of \$----- bearing ----- per cent interest with ----- coupons attached to each, numbered ----- which said bonds have this day been deposited with the Secretary of the Interior and his receipt taken therefor.

That the said obligor does hereby constitute and appoint the Secretary of the Interior as his attorney, for him and in his name to collect or to sell, assign and transfer the said United States bonds above described and deposited by the obligor as

aforesaid, pursuant to authority conferred by section 1320, of the revenue act of 1918, approved February 24, 1919, as security for the faithful performance of any and all of the conditions or stipulations as hereinbefore set out, and it is agreed that, in case of any default in the performance of the conditions and stipulations of such undertaking the said attorney shall have full power to collect said bonds or any part thereof, or to sell, assign, and transfer said bonds or any part thereof without notice, at public or private sale, free from any equity of redemption or without appraisalment or valuation, notice and right to redeem being waived, and to apply proceeds of such sale or collection in whole or in part to the satisfaction of any damages, or deficiencies arising by reason of such default, as said attorney may deem best. The interest accruing upon said United States bonds deposited as above stated, in the absence of any default in the performance of any of the conditions or stipulations of the bond, shall be paid to said obligor. The said obligor hereby for himself, his heirs, executors, administrators, and assigns ratifies and confirms whatever his said attorney shall do by virtue of these presents.

In witness whereof I have hereunto set my hand and seal this _____ day of _____ 19__.

Signature. [L. S.]

Before me, the undersigned, a notary public within and for the county of _____, in the State of _____, personally appeared _____ and duly acknowledged the execution of the foregoing bond and power of attorney.

Witness my hand and notarial seal this _____ day of _____, 19__.

[Notarial Seal.]

5. PREFERENCE RIGHT, HOW SECURED.—A preference right over others to a permit may be obtained, under section 13 of the act, by

(a) Erecting upon the land desired, subsequent to the approval of the act, a monument not less than 4 feet high, at some conspicuous place thereon, of such a size as to be visible to anyone who may be interested. The monument may be of iron, stone, or durable wood, not less than 4 inches square or in diameter, and must be firmly embedded in the ground.

(b) Posting on or near said monument a notice stating that an application for permit will be made within 30 days after date of posting said notice, the notice to give the date and hour of posting, to be signed by the applicant, and give such a general description of the land to be covered by the permit, by reference to courses and distances from such monument and other natural objects and permanent monuments, as will reasonably identify the land. The area, approximately, must also be stated, and the notice must be so protected as to prevent its destruction by the elements. The preference right will exist for 30 days after the date of posting such notice, and if no application is filed within that time, the land will be subjected to any other application for permit or to other disposal.

(See *Purvis vs. Witt*, 49 L. D. 260; *Blakesley vs. McCord*, 49 L. D. 418.)

(c) In cases of conflict between a preference right application and one filed without any claim of preference, the priority of the initiation of the claim will govern; for example, the filing of a proper application in the land office prior to the posting of notice by another, as aforesaid, will give a prior right.

6. FORM AND REQUIREMENTS OF PERMIT.—A permit will confer upon the recipient the exclusive right to prospect for oil or gas upon the lands embraced therein, provided he complies with the terms thereof, which permit will be, in form and substance, substantially as follows:

PERMIT.

THE UNITED STATES OF AMERICA.

DEPARTMENT OF THE INTERIOR.

General Land Office.

U. S. Land Office.....

Serial Number.....

Know all men by these presents, That the Secretary of the Interior, under and by virtue of the act of Congress entitled "An act to promote the mining of coal, phosphate, oil, oil shale, gas, and sodium on the public domain," approved February 25, 1920, has granted and does hereby grant a permit to _____ granting _____ the exclusive right for _____ years from date hereof to prospect for oil or gas, but for no other purpose, the following described lands: _____, upon the express conditions following:

1. To mark each of the corners of the claim within 90 days from date hereof with substantial monuments so that the boundaries can be readily traced on the ground, and post in a conspicuous place, upon the lands covered hereby, a notice that such a permit has been granted, and a description of the lands covered by this permit.

2. Within six months (two years in Alaska) from date hereof to install upon some portion of the lands a substantial and adequate drilling outfit and to commence actual drilling operations.

3. Within one year (three years in Alaska) from date hereof to drill one or more wells, not less than 6 inches in diameter to a depth of at least 500 feet each, unless valuable deposits of oil or gas shall be sooner discovered.

4. Within two years (four years in Alaska) from date hereof to drill one or more wells to a depth of at least 2000 feet, unless valuable deposits of oil or gas shall be sooner discovered.

5. Not to drill any well within 200 feet of any of the outer boundaries of the lands covered by this permit unless the adjoining lands have been patented or the title thereto otherwise vested in private owners.

6. To carry on all operations hereunder in accordance with approved methods and practice; to use all reasonable precautions to prevent waste of oil or gas developed in the land, or the entrance of water through wells drilled by permittees to the oil sands or oil-bearing strata to the destruction or injury of the oil deposits, and to carry out, at the expense of the permittee, all reasonable orders of the Secretary of the Interior relative to prevention of waste and preservation of property, and to comply with such regulations as may be issued by the Secretary of the Interior as to methods of operation.

7. To furnish and maintain during the period of this permit a bond with qualified corporate surety in the sum of \$_____, conditioned against the failure of the permittee to repair promptly, so far as possible, any damage to the oil strata or deposits resulting from improper methods of operation.

8. That as to any lands covered by this permit embraced at the date hereof in any entry or patent with a reservation of the oil and gas deposits to the United States pursuant to the act of July 17, 1914 (38 Stat. 509), or the act of December 29, 1916 (39 Stat. 862), permittee shall reimburse such entrymen or patentee for all damage to crops and improvements caused by drilling or other prospecting operations.

9. That this permit is granted upon the express condition that the right is reserved to the Secretary of the Interior to permit upon such terms as he may determine to be just, for joint or several use, such easements or rights of way, including easements in tunnels upon, through, or in the lands covered thereby, as may be necessary or appropriate to the working of the same, or of other lands containing the deposits described in the act under which this permit is granted.

10. This permit is granted on the express condition that if any of the land covered thereby is embraced in a forest, reclamation, power, or other withdrawal, or is segregated for any particular purpose, operations under this permit shall be so conducted as not to interfere with the administration and use of the land for the purpose for which withdrawn or segregated to a greater extent than may be determined by the Secretary of the Interior to be necessary for the most beneficial use of the land.

11. The granting of this permit shall not preclude the allowance of entry, location, or selection of any of the lands included therein, where such entry, selection, or location is made with a reservation of the mineral deposits to the United States.

12. That until this permittee shall apply for a lease of one-quarter or more of the area included herein, he shall pay to the United States 20 per cent of the gross

value of all oil or gas secured by him from the lands and sold or otherwise disposed of, or held by him for sale or other disposition.

13. The Secretary of the Interior reserves the right and authority to cancel this instrument for failure of the permittee to comply with any of the conditions enumerated herein or to exercise due diligence in the work of development.

14. Valid rights existing at the date of this permit will not be affected thereby.

Dated this ----- day of -----, 19---

Secretary of the Interior.

7. **EXTENSION OF LIFE OF PERMIT.**—If for any good reason the permittee is unable, with the exercise of diligence, to test the land within two years, application for extension for not to exceed two years may be filed within the life of the permit, and must be accompanied by a showing under oath, corroborated, as to the causes that make such extension necessary, and as to what efforts have been made to comply with the condition of the permit; ordinarily no extension will be granted in the absence of the minimum amount of drilling required by the permit. This application should be addressed to the Secretary of the Interior, and be filed either in the district land office or in the General Land Office. This privilege is not applicable to Alaska.*

8. **REWARD FOR DISCOVERY.**—Upon establishing to the satisfaction of the Secretary of the Interior that valuable deposits of oil or gas have been discovered within the limits of the land embraced in the permit, within the period of the permit or extension thereof, the permittee is entitled (a) to a lease of one-fourth of the land included in the permit, on a royalty of 5 per cent, or for at least 160 acres if there be that area in the permit; (b) to a preference right to a lease for the remainder of the land covered by his permit at such royalty as may be fixed by the Secretary of the Interior, not less than 12½ per cent in amount or value of the production, nor more than the royalties fixed for leases under section 18 of the act (sec. 19, par. c, of these regulations), except that on that portion of the average production exceeding 200 barrels per day per well for the calendar month, the royalties shall be 33⅓ per cent for oil of 30 degrees Baume or over and 25 per cent for oil of less than 30 degrees Baume.*

9. **PENALTY FOR DEFAULT.**—The permit will be subject to cancellation by the Secretary of the Interior for failure of the permittee to comply with any of the conditions enumerated therein or to exercise due diligence in the work of development.

* Paragraphs 7 and 8 as amended on August 22, 1922, read as follows:

"Extensions of Time. The provision in section 13 of the act providing for extensions of the life of permits granted upon lands in the United States has been superseded by an act approved January 11, 1922 (42 Stat. 356), which provides that the Secretary of the Interior may, if he shall find that any oil or gas permittee has been unable, with the exercise of diligence, to begin drilling operations or to drill wells of the depth and within the time prescribed by section 13 of the act of congress approved February 25, 1920 (41 Stat. 427), extend the time for beginning such drilling or completing it to the amount specified in the act for such time, not exceeding three years, and upon such conditions as he shall prescribe. Extensions of time may be granted thereunder in proper cases, both in Alaska and the United States, where applications therefor are filed in accordance with the regulations, Circular No. 801, approved January 16, 1922, as amended March 28, 1922, and May 12, 1922 (49 L. D. 110).

"When an application for a lease of the one-fourth part of the area affected by a prospecting permit is submitted, supported by the requisite evidence of discovery and production of oil or gas, such application must be accompanied by further application by the permittee, or by an assignee of such permittee, for a lease of the remaining portion of the area described in the permit; or, in the alternative, a relinquishment of the permit and waiver of preference right in respect of such remaining area must be submitted." 49 L. D. 207. See 49 L. D. 110, 403.

In the absence of discovery of oil or gas within the period of the permit or extension thereof, the permit will thereupon terminate and the lands or deposits will automatically revert to their original status, but the land will continue segregated pending action by the Land Department on any application for extension that is timely filed.

(See Alger, 50 L. D. 201.)

10. PERMITS IN ALASKA.—The foregoing rules and regulations generally will apply to permits in Alaska, under section 13 of the act, but with some modifications, viz:

(Paragraphs 1 to 9, inclusive, apply to permits in Alaska, under section 13 of the act, with modifications set forth in 49 L. D. 208.)

(a) A person, association, or corporation is authorized to hold five permits at one time in said territory, but only one permit in the geologic structure of any one producing oil field; hence subdivision c of section 4 of these regulations should be modified accordingly in making application for permits for lands in Alaska under section 13 of the act.¹

(b) The preference right treated under section 5 of these regulations extends for a period of six months after the erection of monument and posting of notice provided for therein, and the period for marking of the corners is extended to one year after the granting of the permit.

(c) The time for exploratory work in Alaska is four years, instead of two, and there is no provision for extension of such period. The various items necessary in this exploratory work are set forth in the form of permit herein provided, the Alaskan period being included in parentheses, after the period prescribed in the states.

11. PERMITS FOR RESERVED DEPOSITS.—The deposits of oil and gas in all lands for which a patent has issued with a reservation of the oil and gas to the United States, under the act of July 17, 1914 (38 Stat. 509), subject to the preference right, if any, explained in the next succeeding section hereof, may be included in a permit under the provisions of this act, conditioned upon the permittee filing with the Secretary of the Interior a satisfactory bond or undertaking as security for the payment of all damages to crops and improvements on such lands by reason of prospecting, as required by the said act. (See G. L. O. Circular No. 393, 44 L. D., 32.)

12. PREFERENCE RIGHT OF OWNER OF SURFACE.—Under section 20 of the act a preference right to a prospecting permit is given to an entryman or owner of land not claimed under any railroad grant, under the following conditions: (1) The entry must have been made prior to February 25, 1920; (2) the entry must have been bona fide under and pursuant to the act under which made; (3) the entry must have been made without a reservation of the oil and gas, for land unwithdrawn, not classified as oil and gas land, and not known to be valuable for its oil or gas deposits, at date of entry; (4) in case the entry is patented, it must have been with a reservation of the oil and gas to the government; if the entry is not patented, the entryman must waive all right *under the entry* to the oil and gas in the land; (5) if the entry has been assigned or transferred, such assignment or transfer must have been prior to January 1, 1918.

(a) Should an application for permit for entered or patented lands *with a reservation* of the oil and gas content to the United States be filed by a person other than the entryman or owner of the land, the applicant will be required to serve *personal notice* of such application upon the owner or owners of the land so entered or patented, with a warning therein that if said owner desires to exercise his preference right, if any, to a permit, he must file within 30 days his application therefor in the proper local land office. The applicant must furnish evidence of the service of notice on the owner and evidence that the party served is the owner of the land involved, either by his affidavit, duly corroborated, or by certificate of the officer in whose office transfers of real property are to be recorded.

(b) The preference-right applicant must show that he is entitled under the section above outlined, together with his qualifications, to hold a permit as previously set forth in these regulations, and if such an application be filed, the Secretary of the Interior will award the permit to the party entitled thereto.

(c) If the land, either withdrawn or unwithdrawn, is covered by an unpatented nonmineral entry *without a reservation* of the oil and gas content to the government, a prospecting permit may not be granted so long as the entry subsists without such reservation. In cases where applications for prospecting permits are filed by persons other than the entrymen for land in this status such applications will be referred to the United States Geological Survey for classification as to the prospective oil value of the land affected. If the Geological Survey shall conclude and report that the land embraced in such a nonmineral entry is without prospective oil or gas value, the application for permit will be rejected as to such land; but if the Geological Survey shall report that the land has a prospective oil or gas value and offers a favorable opportunity for prospecting operations, then the General Land Office will direct the proper local officers to serve notice on the nonmineral entryman to the effect that said land has been reported as valuable for its oil or gas content, and that the said entryman will be allowed fifteen (15) days within which (1) to file in the local office his consent to a reservation to the government of the oil and gas content of the land embraced in his entry and in which to exercise his preference right, if any, to a prospecting permit for said land by filing a proper application therefor, or (2) to show cause, if any there be, why he should not consent to the mineral reservation, failing in either of which his entry will be canceled without further notice. The local office will thereupon report the action taken to the commissioner, whereupon (1) if the nonmineral entryman shall have failed to take any action, order of cancellation of the nonmineral entry will be made and action taken on the prospecting permit accordingly; (2) if consent to the reservation shall have been filed, a prospecting permit will be granted to the entryman or the former applicant, as the case may be, for the reserved mineral deposits; (3) if the nonmineral entryman shall submit a showing why the entry should not be impressed with a reservation of the mineral to the government, such showing will be referred to the Geological Survey for consideration and report. If upon the receipt of such report the department shall conclude that

the land is without mineral value, the application for prospecting permit will be rejected; but if the department shall conclude that, notwithstanding the showing made by the entryman, the land has a prospective oil and gas value, such action will be taken as the facts may warrant.

From the above it will be seen that it is desirable on the part of any applicant for a prospecting permit for land already embraced in a nonmineral entry without a reservation of the mineral, and likewise desirable on the part of any nonmineral entryman who is contending that the land is nonmineral in character, to submit with their respective applications or showings as complete and accurate geological data as may be procurable, preferably the reports and opinions of qualified experts.

(d) In case of conflict between a preference-right claim under section 20 of the act and one claimed by virtue of section 18 or 19, the issue will be determined on the basis of priority.

(e) Claimants under this section of the act may combine their holdings for the purpose of making joint application for a permit, provided the aggregate area does not exceed 2560 acres and that all the lands for which application is made are within an area of 6 miles square or within the same township.

(f) The right of a permittee under a preference-right permit to a lease after discovery is governed by other provisions of the act, as set forth in section 8 of these regulations.

12½. ASSIGNMENT OF PERMITS.—Permits, after being awarded, may be assigned to qualified persons or corporations upon first obtaining consent of the Secretary of the Interior. Mere rights to receive a permit are not assignable.

II. OIL AND GAS LEASES.

13. DESIGNATION AND OFFER OF LANDS FOR LEASE.—Pursuant to the provisions of section 17 of the act, the unappropriated deposits of oil or gas situated within known geologic structures of producing oil or gas fields, and the lands containing same, will be divided into leasing blocks or tracts in areas not exceeding 640 acres each, and not exceeding in length two and one-half times their width, and offered for lease at a stated royalty by competitive bidding to the highest responsible bidder having the qualifications prescribed by section 15, paragraph (a) hereof.

14. NOTICE OF LEASE OFFER.—Notice of the offer of lands for lease will be given by publication in a newspaper of general circulation in the county in which the lands or deposits are situated for a period of 30 days; such notice will state the day and hour on which the offering will be made at public auction at the United States land office of the district in which the lands are situated, to the qualified bidder offering the highest bonus for the lease at the stated rental and royalty. Copy of the notice will be posted in said local office during the period of publication. This notice will be published at the expense of the government. All bidders at any such auction are warned against violation of the provisions of section 59 of the United

States Criminal Code, approved March 4, 1909, prohibiting unlawful combination or intimidation of bidders.

15. AUCTION OF LEASE.—At the time fixed in the notice, the register or receiver will, by public auction, offer the land for lease on the terms and conditions as to payments of royalties and rents fixed in the notice, to the qualified bidder of the highest amount offered as a bonus for the privilege of leasing the land. The successful bidder must deposit with the receiver on the date of the sale, certified check on a solvent bank, or cash, for one-fifth of the amount bid by him, which payment the receiver will credit to "Trust funds—Unearned moneys." At the time of such payment the successful bidder will also file the requisite showing of his qualifications to receive a lease, which shall include the following:

(a) Proof of citizenship of applicant; by affidavit of such fact, if native born, or if naturalized, by certified copy of the certificate of naturalization, on the form provided for use in public land matters, unless such copy is already on file; if a corporation, by certified copy of the articles of incorporation and a showing as to the residence and citizenship of its stockholders.

(b) The affidavit of the bidder or the affidavit of one of the officers of a corporate bidder that the bidder does not hold another lease in the geologic structure of the same producing oil or gas field, nor more than two leases, or a lease and a permit, in the state, except under sections 18, 18a, 19, and 22 of the act; and also that the acceptance of the lease by such successful bidder will not be in violation of the provisions of section 27 of the act relative to excess holdings by individuals or corporations.

The register and receiver will thereupon transmit such showing, together with a report of the proceedings had at the auction, by special letter to the Commissioner of the General Land Office.

16. AWARD OF LEASE.—On receipt of the report of the auction from the register and receiver, the Secretary of the Interior will take action thereon, and either award the lease to the successful bidder or reject same, notice of which will be forthwith transmitted to the bidder through the local office. If the lease shall be awarded, the notice will be accompanied by copies of leases for execution by the lessee, who shall, within 30 days from receipt of such notice, execute said lease in triplicate, and pay to the receiver the balance of the bonus bid by him, together with the first year's rental, and also cause to be filed in the land office the bond required by section 2(a) of the lease; in lieu of such bond, Liberty bonds will be taken at par in the amount of the bond, as provided in the act of February 24, 1919 (40 Stat. 1148). If the bid be rejected, the receiver will return by his official check the deposit made at the auction. In case of the award of a lease and failure on the part of the bidder to execute same, and otherwise comply with the applicable regulations, the deposit made will be considered forfeited and disposed of as other receipts under this act.

17. FORM OF LEASE.—The lease referred to in the preceding sections will be in form and substance substantially as follows:

LEASE.

U. S. Land Office-----
Serial Number-----

DEPARTMENT OF THE INTERIOR.

Lease of oil and gas lands under the act of February 25, 1920.

Date—Parties.—This indenture of lease entered into, in triplicate, this ----- day of ----- A. D., 19--, by and between the United States of America, acting in this behalf by the Secretary of the Interior, party of the first part, hereinafter called the lessor, and ----- of -----, party of the second part, hereinafter called the lessee, under, pursuant, and subject to the terms and provisions of the act of congress approved February 25, 1920, Public No. 146, entitled "An act to promote the mining of coal, phosphate, oil, oil shale, gas, and sodium on the public domain," hereinafter referred to as the act, which is made a part hereof, witnesseth:

SECTION 1. *Purposes.*—That the lessor in consideration of rents and royalties to be paid, and the covenants to be observed as herein set forth, does hereby grant and lease to the lessee the exclusive right and privilege to drill for, mine, extract, remove, and dispose of all the oil and gas deposits in or under the following described tracts of land situated in the county of -----, State of -----, and more particularly described as follows: ----- containing ----- acres, more or less, together with the right to construct and maintain thereupon all works, buildings, plants, waterways, roads, telegraph or telephone lines, pipe lines, reservoirs, tanks, pumping stations, or other structures necessary to the full enjoyment hereof, for a period of 20 years, with the preferential right in the lessee to renew this lease for successive periods of 10 years, upon such reasonable terms and conditions as may be prescribed by the lessor, unless otherwise provided by law at the time of the expiration of such periods.

SEC. 2. In consideration of the foregoing, the lessee hereby agrees:

(a) *Bond.*—To furnish a bond with approved corporate surety in the penal sum of \$5,000, conditioned upon compliance with the terms of the lease.

(b) *Commence drilling.*—The lessee agrees, within three months from delivery of executed lease, to proceed with reasonable diligence to install on the leased ground a standard or other efficient drilling outfit and equipment, and to commence drilling at least one well, and to continue such drilling with reasonable diligence to production, or to a point where the well is demonstrated unsuccessful, and thereafter to continue drilling with reasonable diligence at least one well at a time until the lessee shall have drilled wells equal in number to the number of 40-acre tracts embraced in the leased premises, unless the lessor shall, for any reason deemed sufficient, consent in writing to the drilling of a less number of wells; the lessee further agrees to drill all necessary wells fairly to offset the wells of others on adjoining land or deposits not the property of the United States.

(c) *Royalty and rents.*—To pay the lessor in advance, beginning with the date of the execution of this lease, a rental of \$1 per acre per annum during the continuance hereof, the rental so paid for any one year to be credited on the royalty for that year, and, in addition to such rental, a royalty of ----- per cent of the value of oil or gas produced from the land leased herein (except oil or gas used for production purposes on said lands or unavoidably lost), or, on demand of the lessor, ----- per cent of the oil or gas produced (except oil or gas used for production purposes on said lands, or unavoidably lost), in which case credit for rent shall be on the basis of the current field price of oil, the royalty, when paid in value, to be due and payable monthly on the fifteenth of each month following the month in which produced, to the receiver of public moneys of the proper land district; and when paid in kind, to be delivered in the field where produced at such times, and in such manner as may be required by the lessor; such royalties, whether in value or kind, shall be subject to reduction whenever the average daily production of any oil well shall not exceed 10 barrels per day, if in the judgment of the lessor the wells can not be successfully operated upon the royalties fixed herein.

(d) *Sales contract.*—To file with the Secretary of the Interior copies of all sales contracts for the disposition of oil and gas produced hereunder, except for production purposes on the land leased, and, in the event the United States shall elect to take its royalties in money instead of in oil or gas, not to sell or otherwise dispose of the products of the land leased, except in accordance with a sales contract or other method first approved by the Secretary of the Interior.

(e) *Monthly statement.*—To furnish monthly statements in detail in such form as may be prescribed by the lessor, showing the amount, quality, and value of all oil and gas produced and saved during the preceding calendar month as the basis for computing the royalty due the lessor. The leased premises, and all wells, improvements, machinery, and fixtures thereon or connected therewith, and all books and accounts of the lessee shall be open at all times for the inspection of any duly authorized officer of the department.

(f) *Plats and reports.*—To furnish annually and at such times as the Secretary shall require, in the manner and form prescribed by the Secretary of the Interior, a plat showing all development work and improvements on the leased lands, and other related information, with a report as to all buildings, structures, or other works placed in or upon said leased lands, accompanied by a report in detail as to the stockholders, investment, depreciation, and cost of operation, together with a statement as to the amount and grade of oil and gas produced and sold, and the amount received therefor, by operations hereunder.

(g) *Log of wells.*—To keep a log in the form prescribed by the Secretary of all the wells drilled by the lessee, showing the strata and character of the ground passed through by the drill, which log, or copy thereof, shall be furnished to said lessor on demand.

(h) *Diligence—Prevention of waste—Health and safety of workmen.*—To exercise reasonable diligence in drilling and operating wells for the oil and gas on the lands covered hereby while such products can be secured in paying quantities, unless consent to suspend operations temporarily is granted by the Secretary of the Interior; to carry on all operations hereunder in a good and workmanlike manner, in accordance with approved methods and practice, having due regard for the prevention of waste of oil or gas developed on the land, or the entrance of water through wells drilled by the lessee to the oil sands or oil-bearing strata, to the destruction or injury of the oil deposits, the preservation and conservation of the property for future productive operations, and to the health and safety of workmen and employees; to plug securely any well before abandoning the same so as to effectually shut off all water from the oil- or gas-bearing strata; not to drill any well within 200 feet of any of the outer boundaries of the lands covered hereby unless the adjoining lands have been patented or the title thereto otherwise vested in private owners; to conduct all mining, drilling, and related productive operations subject to the inspection of the lessor; to carry out at expense of the lessee all reasonable orders and requirements of lessor relative to prevention of waste and preservation of the property and the health and safety of workmen, and on failure so to do the lessor shall have the right to enter on the property to repair damage or prevent waste at lessee's cost; to abide by and conform to regulations in force at the time the lease is granted covering the matters referred to in this paragraph: *Provided*, That lessee shall not be held responsible for delays or casualties occasioned by causes beyond lessee's control.

(i) *Taxes and wages—Freedom of purchase.*—To pay when due all taxes lawfully assessed and levied under the laws of the state upon improvements, oil, and gas produced from the lands hereunder, or other rights, property, or assets of the lessee; to accord all workmen and employees complete freedom of purchase, and to pay all wages due workmen and employees at least twice each month in the lawful money of the United States.

(j) *Reserved deposits.*—To comply with all statutory requirements and regulations thereunder, if the lands embraced herein have been or shall hereafter be disposed of under laws reserving to the United States the deposits of oil and gas therein, subject to such conditions as are or may hereafter be provided by the laws reserving such oil or gas.

(k) *Excess holdings.*—To observe faithfully the provisions of section 27 of the act defining the interest or interests that may be taken, held, or exercised under leases authorized by said act.

(l) *Assignment of lease.*—Not to assign this lease or any interest therein, nor sublet any portion of the leased premises, except with the consent in writing of the Secretary of the Interior first had and obtained.

(m) *Deliver premises in case of forfeiture.*—To deliver up the premises leased, with all permanent improvements thereon, in good order and condition in case of forfeiture of this lease.

SEC. 3. The lessor expressly reserves:

(a) *Rights reserved—Easements and rights of way.*—The right to permit for joint or several use such easements or rights of way, including easements in tunnels

upon, through, or in the lands leased, occupied, or used as may be necessary or appropriate to the working of the same or of other lands containing the deposits described in said act, and the treatment and shipment of products thereof by or under authority of the government, its lessees, or permittees, and for other public purposes.

(b) *Disposition of surface.*—The right to lease, sell, or otherwise dispose of the surface of the lands embraced within this lease under existing law or laws herein-after enacted in so far as said surface is not necessary for the use of the lessee in the extraction and removal of the oil and gas therein.

(c) *Pipe lines to convey at reasonable rates.*—The right to require the lessee, his assignee, or beneficiary, if owner, or operator of, or owner of a controlling interest in any pipe line, or any company operating the same which may be operated accessible to the oil derived from lands under such lease, to accept and convey at reasonable rates and without discriminating the oil of the government or of any citizen or company, not the owner of any pipe line, operating a lease or purchasing oil or gas under the provisions of this act.

(d) *Monopoly and fair prices.*—Full power and authority to carry out and enforce all the provisions of section 30 of the act, to insure the sale of the production of such leased lands to the United States and to the public at reasonable prices to prevent monopoly and to safeguard the public welfare.

(e) *Helium.*—Pursuant to section 1 of the act, the lessor reserves the right to take all helium from any gas produced under this lease, but the lessee shall not be required to extract and save the helium for the lessor; in case the lessor elects to take the helium, the lessee shall deliver all gas containing same, or portion thereof desired, to the lessor in the manner required by the lessor, for the extraction of the helium in such plant or reduction works for that purpose as the lessor may provide, whereupon the residue shall be returned to the lessee with no substantial delay in the delivery of gas produced from the well to the purchaser thereof; provided, that the lessee shall not, as a result of the operation in this section provided for, suffer a diminution in value of the gas from which the helium has been extracted, or loss otherwise, for which the lessee is not reasonably compensated, save for the value of the helium extracted; the lessor further reserves the right to erect, maintain, and operate any and all reduction works and other equipment necessary for the extraction of helium on the premises leased.

SEC. 4. *Surrender and termination of lease.*—The lessee may, on consent of the Secretary of the Interior first had and obtained in writing, surrender and terminate this lease upon the payment of all rents, royalties, and other obligations due and payable to the lessor, and upon payment of all wages and moneys due and payable to the workmen employed by the lessee, and upon a satisfactory showing to the Secretary that the public interest will not be impaired; but in no case shall such termination be effective until the lessee shall have made full provision for conservation and protection of the property; upon like consent had and obtained the lessee may surrender any legal subdivisions of the area included herein.

SEC. 5. *Purchase of materials, etc., on termination of lease.*—Upon the expiration of this lease, or the earlier termination thereof pursuant to the last preceding section, the lessor or another lessee may, if the lessor shall so elect within six months from the termination of the lease, purchase all materials, tools, machinery, appliances, structures, and equipment placed in or upon the land by the lessee, and in use thereon as a necessary or useful part of an operating or producing plant, on the payment to the lessee of such sum as may be fixed as a reasonable price therefore by a board of three appraisers, one of whom shall be chosen by the lessor, one by the lessee, and the other by the two so chosen; pending such election all equipment shall remain in normal position. If the lessor, or another lessee, shall not, within six months, elect to purchase all or any part of such materials, tools, machinery, appliances, structures, and equipment, the lessee shall have the right at any time, within 90 days, to remove from the premises all the materials, tools, machinery, appliances, structures, and equipment which the lessor shall not have elected to purchase, save and except casing in wells and other equipment or apparatus necessary for the preservation of the well or wells.

SEC. 6. *Judicial proceedings in case of default.*—If the lessee shall fail to comply with the provisions of the act or make default in the performance or observance of any of the terms, covenants, and stipulations hereof, or of the general regulations

promulgated and in force at the date hereof, and such default shall continue after service of written notice thereof by the lessor, then the lessor may institute appropriate judicial proceedings for the forfeiture and cancellation of this lease in accordance with the provisions of section 31 of said act; but this provision shall not be construed to prevent the exercise by the lessor of any legal or equitable remedy which the lessor might otherwise have. A waiver of any particular cause of forfeiture shall not prevent the cancellation and forfeiture of this lease for any other cause of forfeiture, or for the same cause occurring at any other time.

SEC. 7. *Heirs and successors in interest.*—It is further covenanted and agreed that each obligation hereunder shall extend to and be binding upon and every benefit hereof shall inure to the heirs, executors, administrators, successors, or assigns of the respective parties hereto.

SEC. 8. *Unlawful interest.*—It is also further agreed that no member of or delegate to congress or resident commissioner, after his election or appointment, or either before or after he has qualified, and during his continuance in office, and that no officer, agent, or employee of the Department of the Interior shall be admitted to any share or part in this lease or derive any benefit that may arise therefrom, and the provisions of section 3741 of the Revised Statutes of the United States, and sections 114, 115, and 116 of the Codification of the Penal Laws of the United States approved March 4, 1909 (35 Stat. 1109), relating to contracts enter into and form a part of this lease so far as the same may be applicable.

In witness whereof

THE UNITED STATES OF AMERICA,

Witness:

By ----- [L. S.]

----- [L. S.]

----- [L. S.]

----- [L. S.]

Bond required under paragraph 2a of the lease should be in substantially the following form:

BOND.

DEPARTMENT OF THE INTERIOR.

GENERAL LAND OFFICE.

U. S. Land Office-----

Serial Number-----

Bond of oil and gas lessee.

[Act of February 25, 1920 (Public No. 146).]

Know all men by these presents, That we, -----, of the county of -----, in the State of -----, as principal, and ----- of the county of -----, in the State of -----, as surety, are held and firmly bound unto the United States of America in the sum of ----- dollars, lawful money of the United States, for the use and benefit of the United States and of any entryman or patentee of any portion of the land covered by the hereinafter described lease heretofore entered or patented with a reservation of the oil and gas deposits to the United States, to be paid to the United States, for which payment, well and truly to be made, we bind ourselves, and each of us, and each of our heirs, executors, administrators, successors, and assigns, jointly and severally by these presents.

Signed with our hands and sealed with our seals this ----- day of -----, in the year of our Lord one thousand nine hundred and -----.

The condition of the foregoing obligation is such that

Whereas the said principal, by instrument dated -----, has been granted the exclusive right to drill for, mine, extract, remove, and dispose of all the oil and gas deposits in or under the following described lands -----, under and pursuant to the provisions of the act approved February 25, 1920 (Public No. 146); and

Whereas the said principal has by such instrument entered into certain covenants and agreements set forth therein, under which operations are to be conducted:

Now, therefore, if said principal shall faithfully comply with all the provisions of the above described lease, then the above obligation is to be void and of no effect, otherwise to remain in full force and virtue.

Signed, sealed, and delivered in presence of

Name and address of witness:

----- [L. S.]
Principal.

----- [L. S.]
Surety.

Where government bonds are deposited as security in lieu of a surety bond, in compliance with paragraph 2a of the lease form, same should be accompanied with a combined bond and power of attorney to sell, duly executed by the lessee, along the same general lines as the form set out in paragraph 4h of these regulations with suitable changes made in the condition of the bond to correspond with the condition in the lease bond, form for which is above set out.

III. RELIEF MEASURES.

Sections 18, 19, and 22 of the act provide for the "relief," so called, of certain defined claimants of oil and gas lands, who at date of the act had not perfected their claims under the preexisting mining laws, and are prevented from doing so by withdrawal of the land or by this act.

18. CONDITIONS FOR RELIEF UNDER SECTION 18:

(a) That the land claimed must have been included in the executive order of withdrawal of September 27, 1909, and must have remained so withdrawn.

(b) That the claim must have been initiated under the placer mining laws prior to July 3, 1910, and claimed and possessed continuously from that time.

(c) That no claimant who has acquired any interest in the land since September 1, 1919, from another claimant who, on that date or since that time, was, or is claiming or holding, more than the maximum allowed a claimant under section 18 of the act, may secure a lease under section 18, or any interest therein. This limitation does not, however, apply to an exchange of an interest in such lands made prior to January 1, 1920, which did not increase or reduce the area or acreage held or claimed, in excess of the maximum by either party to the exchange.

(d) That claimant or predecessors must have drilled an oil or gas well on the land to discovery.

(e) That all conflicting claims asserted prior to July 1, 1919, must have been disposed of, as provided in section 28 hereof or otherwise.

(f) That no claimant who has been guilty of any fraud or who had knowledge or reasonable grounds to know of any fraud, or who has not acted honestly and in good faith, shall be entitled to any of the benefits of this section.

(g) That claimant must, on or before August 25, 1920, file a relinquishment to the United States of all right, title, and interest in and to the land, together with an application for a lease. This relinquishment may be in the form of an unconditional quitclaim

deed, duly executed and acknowledged, but not recorded, and when filed will be held for such action as the facts and the law in the case warrant and require.

(h) That claimant must pay for one-eighth of the value at the time of production of all oil and gas produced prior to date of filing relinquishment and application for relief, exclusive of oil and gas used on the land for production purposes, or unavoidably lost.

19. RELIEF THAT MAY BE GRANTED UNDER SECTION 18:

(a) *Lands not in naval petroleum reserves.*—A qualified claimant, upon complying with the provisions of the act and these regulations, will be entitled to a 20-year lease from the United States, commencing and effective as of the date of filing relinquishment and application for relief, substantially in the form prescribed in section 17 hereof, at a royalty to be fixed by the Secretary of the Interior, but not less than $12\frac{1}{2}$ per cent of all oil and gas produced exclusive of that used for production purposes on the claim, or unavoidably lost. There is, however, a limitation placed by the act upon the acreage that may be included in such lease. If the geologic oil or gas structure of the producing field in which the claim is situated does not exceed 640 acres in area the lease may include the entire area if covered by the claim; but if the area of such structure exceeds 640 acres the act provides that not more than one-half of the area, same to be selected by the claimant but in no case to exceed 3200 acres, may be leased to any one claimant.

(b) *Lands in naval petroleum reserves.*—If the land claimed is within a naval petroleum reserve the claimant will be entitled to lease only the producing wells on the claim, together with an area of land sufficient for the operation of such wells, upon a royalty to be fixed by the Secretary of the Interior, but not less than $12\frac{1}{2}$ per cent of the production, except that used for production purposes on the claim or unavoidably lost. The act forbids the drilling of any wells in lands subject to this provision within 660 feet of the leased wells without the consent of the lessee. It further provides that the President may, in his discretion, lease the remainder or any part of the claim on which such wells have been drilled, and in the event of such leasing the claimant shall have a preference to such lease. The President may also permit the lessee of any well to drill additional wells within the limited area of 660 feet upon such terms and conditions as he may prescribe. These terms and conditions can not be prescribed here, but will be determined on the merits in each separate case.

(c) *Royalties.*—The royalties payable under leases granted pursuant to section 18 of the act are cumulative, and are hereby determined and prescribed as follows:

For all oil produced of 30° Baume or over upon each claim on which the wells average not exceeding 20 barrels per day per well for the calendar month, $12\frac{1}{2}$ per cent; upon each claim on which the wells average more than 20 barrels and not more than 50 barrels per day per well for the calendar month, $16\frac{2}{3}$ per cent; upon each claim on which the wells average more than 50 barrels and not more than 100 barrels per day per well for the calendar month, 20 per cent;

upon each claim on which the wells average more than 100 barrels per day per well for the calendar month, 25 per cent.

For all oil produced of less than 30° Baume upon each claim on which the wells average not exceeding 20 barrels per day per well for the calendar month, $12\frac{1}{2}$ per cent; upon each claim on which the wells average more than 20 barrels and not more than 50 barrels per day per well for the calendar month, $14\frac{2}{3}$ per cent; upon each claim on which the wells average more than 50 barrels and not more than 100 barrels per day per well for the calendar month, $16\frac{2}{3}$ per cent; upon each claim on which the wells average more than 100 barrels per day per well for the calendar month, 20 per cent.

Only wells which have a commercial production during at least a part of the month shall be considered in ascertaining the average production herein, and the Secretary of the Interior shall determine what are commercially productive wells under this provision.

The royalties on gas produced, if any, will be fixed and determined in each lease.

20. CONDITIONS FOR RELIEF UNDER SECTION 19:

A. *For permit.*—(a) That the land must not be in a naval petroleum reserve.

(b) The applicant or his predecessor in interest must have been an occupant or claimant of the land on or before October 1, 1919, under a claim initiated under the placer mining laws, when the land was not withdrawn, provided that a transferee of such a claim subsequent to October 1, 1919, will not be permitted to hold permits under section 19 of the act to exceed 2560 acres in the same geologic structure, nor for more than three times that area in the same state.

(c) That claimant, by himself or predecessor in interest, must have performed all acts under the preexisting laws necessary to valid locations, except to make discovery.

(d) That prior to February 25, 1920, claimant must have performed work or expended on or for the benefit of such locations an amount equal in the aggregate to \$250 for each location.

(e) That no claimant who has been guilty of any fraud or who had knowledge, or reasonable grounds to know of any fraud, or who has not acted honestly and in good faith, shall be entitled to any of the benefits of this section.

(f) That claimant must, on or before August 25, 1920, file a relinquishment to the United States of all right, title, and interest in and to the land, together with an application for a permit. This relinquishment may be in the form of an unconditional quit-claim deed, duly executed and acknowledged, but not recorded, and when filed will be held for such action as the facts and the law in the case warrant and require.

B. *For lease.*—The conditions necessary to obtaining a lease under section 19 of the act are identical with those outlined in paragraphs (a), (b), (e), and (f), for permits, together with the following additional conditions:

(a) That claimant must have made a discovery of oil or gas on or before February 25, 1920.

(b) That claimant must not be entitled to relief on the land in question under section 18 of the act.

(c) That claimant must pay for one-eighth of the past production up to date of filing application for relief, exclusive of that used on the land for production purposes or unavoidably lost.

21. RELIEF THAT MAY BE GRANTED UNDER SECTION 19:

(a) A claimant qualified under the above conditions relating to permits, upon complying with the provisions of the act and these regulations, will be entitled to a prospecting permit upon the same terms, conditions, and limitations as to acreage, as other permits provided for in the act, substantially in form prescribed in section 6 hereof.

(b) A claimant qualified under the above conditions relating to leases is entitled to a 20-year lease from the United States, effective from date of filing application for relief, substantially in the form prescribed in section 17 hereof, the royalty to be fixed by the Secretary of the Interior, but such royalty may not be less than $12\frac{1}{2}$ per cent of all oil and gas produced exclusive of that used for production purposes on the land or unavoidably lost. In the event the land is in the geologic structure of proven territory at the time of granting the permit under this section, the royalty required under the lease based thereon shall not be less than $12\frac{1}{2}$ per cent, but if at the time the permit is granted the land is not in proven territory the amount of royalty will be governed by the general terms of the act as set out in section 14 thereof.

22. ALASKA CLAIMS—CONDITIONS FOR RELIEF UNDER SECTION 22:

A. *For permit.*—(a) That claimant must have been an occupant or claimant of the land on February 25, 1920, under a claim initiated under the placer mining laws by claimant or predecessors prior to November 3, 1910, the date of the executive order withdrawing all public lands in Alaska containing petroleum deposits, including those in national forests.

(b) That claimant must have performed all acts prior to November 3, 1910, under the then existing laws necessary to valid locations except to make discovery.

(c) That claimant, (1) prior to November 3, 1910, must have made substantial improvements for the discovery of oil or gas on or for each location, or (2) prior to February 25, 1920, expended not less than \$250 in improvements on or for the benefit of each location.

(d) That claimant must on or before February 25, 1921, or within six months after final denial or withdrawal of application for patent, file a relinquishment to the United States of all right, title, and interest in and to the land. This relinquishment must be in the form of an unconditional quit-claim deed, duly executed and acknowledged, but not recorded, and when filed will be held for such action as the facts and the law in the case warrant and require.

In addition to the above, the conditions outlined in paragraph (e) of section 20 hereof are applicable to relief in Alaska.

B. *For lease.*—The conditions necessary to obtaining a lease under section 22 of the act are identical with those outlined in the para-

graphs relating to permits in Alaska together with the following additional conditions:

(a) That claimant or predecessors must have drilled an oil or gas well on the land to discovery.

(b) That claimant must pay for one-eighth of the past production exclusive of that used on the land for production purposes or unavoidably lost.

23. ALASKA CLAIMS—RELIEF THAT MAY BE GRANTED UNDER SECTION 22:

(a) A claimant qualified under the above conditions relating to permits, upon complying with the conditions of the act and these regulations will be entitled to prospecting permits under the same terms and conditions as other permits in Alaska provided for in section 13 of the act, substantially in the form prescribed in section 6 hereof.

(b) A claimant qualified under the above conditions relating to leases is entitled to a lease substantially in the form prescribed in section 17 hereof, the rental and royalty to be fixed by the Secretary of the Interior and specified in the lease, subject to readjustment at the end of each 20-year period of the lease.

(c) Only five permits or leases in the aggregate may be held at any one time by any claimant, and not more than 1280 acres may be included in one permit under section 22 of the act.

23½. ROYALTIES AND RENTALS ON OIL AND GAS LEASES IN ALASKA.—The royalties and rentals payable under oil and gas leases granted in Alaska pursuant to sections 14 and 22 of the act of February 25, 1920 (Public No. 146), are hereby determined and prescribed as follows:

(a) For leases granted under section 22 of the act, the royalty shall be: (1) For the first five years from and after the date of the lease, no royalty, except in the case of leases whereon the producing wells yield an average of 100 barrels or more per well per day for the calendar month, in which event the royalty shall be 5 per cent of all oil produced; (2) for the second period of five years from and after the date of each lease under section 22 of the act the royalty upon all leases shall be 5 per cent; (3) for the succeeding 10 years the royalty upon all leases under section 22 of the act shall be 10 per cent of all oil produced.

(b) Upon leases granted in Alaska under section 14 of the act, the permittee who discovers oil will be entitled to a lease for one-fourth of the area of the permit without payment of royalty for the first five years succeeding the date of the lease and thereafter shall pay a royalty of 5 per cent upon all oil produced. On the remaining lands included within the area of the permit, the permittee will be given a preference right to a lease without payment of royalty for the first five years succeeding the date of the lease, except in the case of leases whereon the producing wells yield an average of 100 barrels or more per well per day for the calendar month, in which event the royalty shall be 5 per cent; for the second five years, the lessee will be required to pay a royalty of 5 per cent upon all oil

produced, and for the succeeding 10 years, a royalty of 10 per cent upon all oil produced.

(c) No royalty will be charged in any case upon leases wherein the wells upon the lands average less than 10 barrels per well per day for the calendar month.

(d) No rental upon any oil or gas lease in Alaska will be charged during the first five years succeeding the date of the lease. After the expiration of the first five years succeeding the date of the lease, a rental of 10 cents per acre per annum will be charged on all leases, payable in advance; *provided*, that the rentals so paid for any one year shall be credited upon the royalties accruing for that year.

(e) The royalties on gas produced, if any, will be fixed and determined in each lease.

24. BENEFICIARIES UNDER LEASES OR PERMITS.—All leases or permits under sections 18, 19, and 22 shall inure to the benefit of the claimant and all persons claiming through or under him by lease, contract, or otherwise, as their interests may appear, subject to the same limitations as to area and acreage as is provided for claimant, but such persons will not necessarily be made parties to government leases, and may assert their rights in the courts. Disputes of this character are not to be confused with adverse claims based upon independent title, hereinafter referred to. (See Sec. 28 hereof.)

24½. WHO MAY APPLY.—All proper parties to a claim for relief under section 18, 19, or 22 of the act should join in the application, but, if for any sufficient reason that is impracticable, any person claiming a fractional or undivided interest in such claim may make application for a lease or permit, stating the nature and extent of his interest, and the reasons for nonjoinder of his coowner or coowners. In cases where two or more applications are made for the same claim or part of a claim, leases or permits will be granted to one or more of the claimants, as the law and facts shall warrant and as shall be deemed just.

25. FORM AND CONTENTS OF APPLICATION.—No set forms of application for a lease under section 18, 19, or 22, or a permit under section 19 or 22 of the act can be prescribed because the facts and circumstances pertaining to claims for relief are so varied. Applications for such leases or permits must be made under oath and the supporting documents and papers certified or under oath so far as practicable. The application, with all the accompanying papers, should be filed in the United States land office of the district in which the land is situated. Applications and supporting papers need not be executed in duplicate, but one complete copy of each application and supporting papers (except abstract of title) should be filed with the application, which copy will be transmitted by the register and receiver to the Chief of Field Division and notation to that effect made on the original. The application should contain full information as to the facts upon which the applicant relies for relief, covering the following points and such additional matters as may, from the peculiar facts in the case, be material in the establishment of his claim under the law:

(a) Date of application for lease or permit.

(b) Applicant's name, post-office address and citizenship.

(c) *Description of land.*—The land for which the application is made must be described by legal subdivisions of section, township, and range, if surveyed; if not surveyed, then by metes and bounds and courses and distances from some permanent monument. If the application is for a lease of unsurveyed land, the applicant, after he has been awarded the right to a lease, but before issuance thereof, will be required to deposit with the United States surveyor general of the state in which the land is situated the estimated cost of making a survey of the land, the balance, if any, after the survey is completed to be returned.

(d) *Origin and basis of applicant's claim for relief.*—The applicant must bring his claim clearly within all the requirements of the act as specifically pointed out in sections 18, 20, and 22 of these regulations. Every application must be supported by a duly certified abstract of title to the land brought up to the date of filing the application. In the event an abstract of title is already on file in the land department, a supplemental abstract extending over the period or periods not covered by the former may be furnished, and if furnished will be considered in connection with the abstract already on file. If any fraud has been committed in connection therewith, then a full affirmative showing must be made by the applicant to the effect that he has not been a party to such fraud, and that he has not been guilty of any fraud or had knowledge of fraud or reasonable grounds to know of any fraud in connection with his claim. If an application for patent has been filed, a brief résumé of the actions taken thereon should be stated. If the land is or has been involved in litigation in the courts to which the United States is a party, the status or result of such litigation should be furnished.

(e) *Particulars as to conflicting claims or interests.*—All conflicting or disputed claims, if any, to the land or production therefrom, specifying the character and extent of such interests, must be shown.

(f) *Discovery.*—Before a lease may be awarded under the relief sections of the act it must be satisfactorily shown that the applicant or his predecessors have drilled a well to a substantial and certain discovery of oil or gas in a producing stratum on the land covered by the location under which the applicant is asserting his claim.

(g) *Wells, improvements, and production.*—With each application for a lease under section 18, 19, or 22 of the act there must be filed a complete and detailed statement showing the number, depth, condition, and present daily production of all wells drilled on the land by the applicant and his predecessors in interest, and the nature and extent of all other improvements placed thereon by them.

With each application for a permit under section 19 or 22 of the act, a description of the work performed and improvements made upon or for the benefit of the location by the applicant and his predecessors must be filed, together with an itemized statement of the cost thereof. If the application is made under section 22, the date the work was performed or the improvements made must also be shown.

In either case applicant must show the position of all wells and improvements by courses and distances from the nearest corner of the public land survey, if the land is surveyed; if not surveyed, then from a corner of the claim. This may be shown by means of a diagram.

(h) *Amount and value of past production.*—Claimant must furnish a complete detailed statement, by months, of all past production from the land, up to the date of filing the application and relinquishment, showing (1) the grade and total quantity of oil and gas produced; (2) the amount sold or otherwise disposed of, to whom sold, and the selling price or other consideration received therefor; (3) a statement of the grade and amount of any and all such production held in storage, when produced, and the value at time of production; and (4) the amount consumed for production purposes on the land, or unavoidably lost.

Copies of any and all contracts under which oil or gas produced from the land has been or is being sold or otherwise disposed of must be furnished.

(i) *Inspection of records.*—The agreement on the part of the applicant to permit the inspection of any and all books, records, and accounts having any bearing on the data or information required by the application and to furnish copies or abstracts of such books, records, or accounts, on demand.

(j) *Interest in other leases and permits.*—The applicant will also furnish a complete statement of all lands for which he has filed application for lease or permit under sections 18, 19, and 22 of the act, and of such lands as are included in other applications in which he has any direct or indirect interest, together with a full disclosure of such interest by stock ownership or otherwise. If the applicant is a corporation, a certified copy of its articles of incorporation must be furnished, and a full disclosure made of the ownership of its stock, whether such stock is owned, held, or controlled directly or indirectly by any other person or corporation, who or which is an applicant for or a holder of a lease under said sections, and, in the event of such ownership, a description of the legal subdivisions of all the lands affected thereby is required. Lists of stockholders need not necessarily be filed in the local land offices, but may be filed directly with the Commissioner of the General Land Office, where they will be kept confidential except for government purposes. In the event the lands so affected are not surveyed they may be described by the usual method of courses and distances and acreage.

(k) *Limitation of area.*—Applications for lease under section 18 of the act should disclose all other applications in which the applicant is directly or indirectly interested, for lease under said section for lands (describing same) in the same geologic structure; and applications under section 22 of the act should show all other applications for leases or permits under said section. The boundaries of the geologic structures of the various producing fields will be determined and announced by the United States Geological Survey under supervision of the Secretary of the Interior, and such information will be placed on file in all United States land offices.

(*l*) *Interests of beneficiaries.*—In applications for lease the nature and extent of the interests of all beneficiaries thereof by virtue of operating contracts or otherwise, not covered by paragraph 25 (*j*), must be disclosed, together with a full showing of all their interests in other leases or applications for leases under this act. If the beneficiary is a corporation or joint-stock company, a full disclosure must be made of the ownership of its stock and the residence and citizenship of its stockholders.

26. PAYMENT OF ROYALTY ON PAST PRODUCTION.—The application must be accompanied by a certified check in the amount of one-eighth of the gross value of all oil and gas produced and sold or held in storage, as per the statement required in paragraph 25 (*h*). All such sums will be held by the receiver in his account of "Trust funds—Unearned moneys" to await instructions as to their disposition. In lieu of the certified check herein required, the applicant may be permitted to deposit a bond by approved surety company in an amount not less than one-eighth of the estimated gross value of all oil and gas produced and sold or held in storage, securing the payment to the United States within 30 days from the award of the lease of the cash value of the past production due the United States under this act. In cases where the proceeds, or part thereof, of such past production have been deposited in escrow, pursuant to operating agreements under the act of August 25, 1914 (38 Stat. 708), or where in suits brought by the government affecting such lands the proceeds of production, or part thereof, have been impounded in the custody of receivers, a formal tender may be made of the funds so held in escrow or impounded to the extent available or in the amount necessary, as the case may be, in lieu of such cash payment. In such cases the interest accumulating on such escrowed or impounded moneys after the tender is made will go to the government.

Liberty bonds will be accepted at original cost in payment of royalty on past production in such proportion as the escrowed or impounded moneys have been invested therein.

Operating contracts made under the provisions of the act of August 25, 1914, *supra*, and in operation at the time of such tender, will not be terminated until the entire transaction of granting a lease and payment of royalty on past production shall have been consummated; nor will the Department of Justice be requested to dismiss any suits involving the land affected until the application for a lease has been adjudicated and approved; whereupon, after the suit has been dismissed and the impounded money tendered paid over to the government, the lease will be executed and delivered.

27. PUBLICATION OF NOTICE.—Immediately upon the filing of an application for a lease or permit under section 18, 19, or 22 of the act, the register and receiver will cause to be published, at the expense of the applicant, in a newspaper designated by the register, published in the vicinity of the land and most likely to give notice to the general public, a notice of the said application in substantially the following form:

PUBLISHED NOTICE.

DEPARTMENT OF THE INTERIOR.

UNITED STATES LAND OFFICE.

-----, 19....

Notice is hereby given that -----, of -----, has applied for an oil and gas ----- under section ----- of the act of February 25, 1920 (Public No. 146), for ----- section -----, township ----- of range -----, ----- meridian, ----- county, State of ----- Any and all persons having adverse or conflicting claims to said land are hereby notified that a full statement, under oath, of such claim should be filed in this office showing a superior right to a permit or lease under said act or a valid existing adverse or conflicting claim to the land or the minerals therein under the public land laws, on or before -----; otherwise such claim may be disregarded in granting the permit or lease applied for.

-----, Register.

The register and receiver will fix a date in the notice on or before which adverse or conflicting claims may be asserted, which date should be not less than 30 nor more than 40 days after the date of first publication of the notice.

Such notice will be published in the regular issue and not in any supplement of the newspaper, once each week for a period of five consecutive weeks if in a weekly paper, or if in a daily paper for a period of 30 days. The register and receiver will post a copy of said notice in a conspicuous place in their office during the period of publication.

Upon the applicant's furnishing satisfactory proof of such publication, but not earlier than the day following that set in the published notice on or before which adverse or conflicting claims were to be filed, the register and receiver will transmit by special letter all papers in the case, including any adverse or conflicting claims that may have been filed, together with proof of posting said notice in their office, to the Commissioner of the General Land Office.

28. ADVERSE OR CONFLICTING CLAIMS—PROCEDURE.—In case of adverse or conflicting claims for leases under section 18, 19, or 22, or permits under section 19 or 22, the Secretary of the Interior is clothed with authority to grant leases or permits, as the case may be, to one or more of them, as shall be deemed just.

(a) To have their claims considered in connection with the awarding of leases or permits it will be necessary for adverse claimants to make full showing (1) of a superior right to a lease or permit under this act, or (2) a superior right under some other public land law. If the former, the conflicting claimant must make out a complete case in his own behalf as required by these regulations on or before August 25, 1920.

(b) Upon receipt of the application and showing of an adverse claimant the Commissioner of the General Land Office will consider same. If, in his judgment, the adverse claimant has failed to make a prima facie case showing that he is entitled to a lease or permit, as the case may be, for at least part of the land, his application will

be rejected, subject to appeal to the Secretary of the Interior. But if the adverse claimant makes out a *prima facie* case the commissioner will take such course as may be advisable under the circumstances of each particular case to settle and adjust the rights of the respective parties, and may, if deemed necessary, order a formal hearing to settle disputed questions of fact. In the absence of appeal to the Secretary of the Interior from the final order or decision of the commissioner same shall be conclusive.

29. **COMPROMISES UNDER SECTION 18a.**—No special procedure will be outlined under this section. Any request for a compromise or settlement under this section which may be filed in the Land Department will be transmitted to the President with such report as may be deemed advisable under the circumstances of the particular case. In case the land is in a naval petroleum reserve the Navy Department will be consulted before making such report.

IV. RIGHTS OF WAY FOR PIPE LINES.

30. Section 28 of the act grants to any applicant having the qualifications outlined in section 1 of these regulations rights of way through public lands of the United States, including national forests, for pipe-line purposes for the transportation of oil or natural gas, on condition that the pipe lines for which rights of way are granted shall be operated and maintained as common carriers. The grant carries with it the right to the use of the ground actually occupied by the pipe line, and 25 feet on each side thereof for the purpose of construction, maintenance, and operation of the pipe line. Applicants for rights of way under this act will be governed by the regulations set forth in circular of June 6, 1908 (36 L. D. 567), in so far as applicable, appropriate changes being made in the forms therein prescribed to make them applicable to right of way cases arising under the act of February 25, 1920 (public No. 146), for pipe lines to be constructed, maintained, and operated as common carriers. Failure on the part of grantee to fulfill the conditions imposed by the act shall be ground for forfeiture of the grant by the United States district court for the district in which the property, or some part thereof, is situated.

V. FEES AND COMMISSIONS.

31. Under the authority of section 38 of the act, the following fees and commissions are prescribed for transactions under the act:

(a) For receiving and acting on each application for a permit, lease, or other right filed in the district land office in accordance with these regulations, there shall be paid a fee of \$2 for each 160 acres, or fraction thereof, in such application, but such fee in no case to be less than \$10, the same to be paid by the applicant and considered as earned when paid, and to be credited in equal parts on the compensation of the register and receiver within the limitations provided by law.

(b) A commission of 1 per cent on all moneys received in each receiver's office, to be equally divided between the register and receiver; such commission will not be collected from the applicant,

lessee, or permittee in addition to the moneys otherwise provided to be paid.

It should be understood that the commission here provided for will not affect the disposition of the proceeds arising from operations under the act as provided in section 35 thereof; also that such commission will be credited on compensation of registers and receivers only to the extent of the limitation provided by law for maximum compensation of such officers.

(See Hotkin, 49 L. D. 344.)

VI. REPEALING AND SAVING CLAUSES.

32. Section 37 of the act provides that hereafter the deposits of coal, phosphate, sodium, oil, oil shale and gas, referred to and described therein, may be disposed of only in the manner provided in the act "except as to valid claims existent at date of passage of this act, and thereafter maintained in compliance with the laws under which initiated, which claims may be perfected under such laws, including discovery.

Stated negatively under this section of the act the following classes of oil or gas placer locations, so called, notwithstanding absence of fraud and full compliance with law in other respects, may not proceed to patent, viz:

(a) Any location made after withdrawal of the land.

(b) Any location made before withdrawal of the land, but not perfected by discovery at date of withdrawal, which does not come within the protective proviso of section 2 of the act of June 25, 1910 (36 Stat. 847); that is to say, any claimant who, at date of withdrawal, was not a *bona fide* occupant or claimant in diligent prosecution of work leading to discovery of oil or gas, and who has not continued in such diligent prosecution to discovery.

(c) Any location on lands not withdrawn, on which, at the date of the act, the claimant had not made discovery or was not in diligent prosecution of work leading to discovery, and does not continue such work with diligence to discovery.

Very respectfully,

CLAY TALLMAN,
Commissioner.

Approved:

JOHN BARTON PAYNE,
Secretary.

APPENDIX.

(To 'Oil and Gas Regulations.')

**DIGEST OF DECISIONS AND OPINIONS IN CONNECTION WITH THE
ADMINISTRATION OF THE ACT OF FEBRUARY 25, 1920,
AS APPLIED TO OIL AND GAS.**

Permits for Lands in Government Reclamation Projects.

In the case of permits issued for lands within reclamation withdrawals the following additional conditions will be included in the permit:

7. (b) To reimburse damage sustained by any reclamation homestead entryman pursuant to the requirements of paragraph 8 hereof: (c) To pay any damage caused to any reclamation project or the water supply thereof by failure to comply fully with the requirements of paragraph 9 hereof.

8. That as to any lands covered by this permit which are also embraced in any reclamation homestead entry with a reservation of the oil and gas to the United States, permittee shall reimburse the entryman for all damage to crops or improvements caused by such drilling or other operations, such damage to include reimbursement of the entryman by the permittee of all reclamation charges for construction, operation, and maintenance for the portion of the land used and occupied by the permittee during the period of such use and occupation.

9. That as to any lands covered by this permit within the area of any government reclamation project or in proximity thereto the permittee shall erect such dikes and embankments or take such other precautions as may be necessary, as required by the project manager, effectively to impound any flow of refuse oil, salt water, or oil from wells drilled, to prevent any injury to lands susceptible of irrigation under such project or injury to the water supply thereof.

In such case the following form of bond will be required:

BOND,

DEPARTMENT OF THE INTERIOR.

GENERAL LAND OFFICE.

U. S. Land Office.....
Serial Number.....

Bond of oil and gas permittee.

[Act of February 25, 1920 (Public No. 146).]

Know all men by these presents, That ----- of ----- State of ----- as principal, and ----- of ----- State of -----, as surety, are held and firmly bound unto the United States of America, for the use and benefit of the United States and of any reclamation homestead entryman on any of the hereinafter described lands embraced in that certain prospecting permit hereinafter referred to, in the sum of \$5,000, lawful money of the United States, for which payment, well and truly to be made, we bind ourselves, and each of us, and each of our heirs, executors, administrators, successors, and assigns jointly and severally by these presents.

Signed with our hands and sealed with our seals this ----- day of -----, 19.... The condition of the foregoing obligation is such that, whereas the said principal has been granted under the act of February 25, 1920, Public No. 146, a permit (Serial No. -----) to prospect for oil and gas for two years, upon the following described lands: ----- on condition that the permittee shall (a) repair promptly, so far as possible, any damage to the oil strata or deposits resulting from improper methods of operation; (b) reimburse any homestead entryman of land covered by said permit for all damage to crops and improvements caused by drilling or other operation by the permittee, such damage to include reimbursement of the entryman by the permittee of all reclamation charges for construction, operation and maintenance for the portion of the land used and occupied by the permittee during

the period of such use and occupation by the permittee; and (c) erect such dikes and embankments or take such other precautions as may be necessary, as required by the project manager, effectively to impound any flow of refuse oil, salt water, or oil from wells drilled, to prevent any injury to lands susceptible of irrigation under any government irrigation project or injury to the water supply thereof.

Now, therefore, if said principal shall promptly and in all respects comply with said conditions, then the above obligation shall be void and of no effect; otherwise and in default of full and complete compliance therewith the said obligations shall remain in full force and effect.

Signed, sealed and delivered in the presence of:

Name and address of witness:

----- [L. S]
Principal.

----- [L. S]
Surety.

Permits for Deposits Reserved Under Act of July 17, 1914 (38 Stat. 509).

In the case of permits issued for deposits of oil or gas reserved to the United States under the provisions of the act of July 17, 1914 (38 Stat. 509), the following additional condition will be included in paragraph 7 thereof:

(b) To reimburse any entryman or owner of any portion of said lands heretofore entered with a reservation of the oil and gas deposits to the United States made pursuant to the act of July 17, 1914 (38 Stat. 509), for any damage to the crops and improvements of such entryman or owner resulting from drilling or other prospecting operations.

In such case the following form of bond will be required:

BOND

DEPARTMENT OF THE INTERIOR.

GENERAL LAND OFFICE.

U. S. Land Office-----
Serial Number-----

Bond of oil and gas permittee.

[Act of February 25, 1920 (Public No. 146).]

Know all men by these presents, That -----, of -----, State of ----- as principal, and -----, of -----, State of -----, as surety, are held and firmly bound unto the United States of America, for the use and benefit of the United States, and of any entryman or owner of any of the hereinafter described lands embraced in that certain prospecting permit hereinafter referred to, in the sum of \$1,000 lawful money of the United States, for which payment, well and truly to be made, we bind ourselves, and each of us, and each of our heirs, executors, administrators, successors, and assigns, jointly and severally by these presents.

Signed with our hands and sealed with our seals this ----- day of -----, 19-----.

The condition of the foregoing obligation is such that, whereas the said principal has been granted under the act of February 25, 1920, Public No. 146, a permit (Serial number -----) to prospect for oil and gas for two years upon the following lands: ----- on condition that the permittee shall (a) repair promptly, so far as possible, any damage to the oil strata or deposits resulting from improper methods of operation; (b) reimburse any entryman or owner of any portion of said lands heretofore entered with a reservation of the oil and gas deposits to the United States made pursuant to the act of July 17, 1914 (38 Stat. 509), for any damage to the crops and improvements of such entryman or owner resulting from drilling or other prospecting operations.

Now, therefore, if said principal shall promptly and in all respects comply with said conditions, then the above obligation shall be void and of no effect; otherwise

and in default of full and complete compliance therewith the said obligations shall remain in full force and effect.

Signed, sealed, and delivered in the presence of:

Name and address of witness:

----- [L. S]
Principal

----- [L. S]
Surety.

Attorneys in Fact.

In making applications for lease or permit corporations may act by attorneys in fact. Individuals and associations of individuals should execute their own papers.

Limitation of Holdings.

A corporation (except under the relief sections) may not have an interest in more than three leases, either directly as a lessee, or indirectly as a stockholder in a corporate lessee. An individual may hold stock in any number of corporations holding leases provided his stock interests do not represent a greater acreage than 2560 in the same producing structure, or 7680 acres in the same state.

Alien Ownership.

Aliens may not have any direct holding of lease under the oil leasing act, but may be stockholders in American corporations holding leases, provided the laws of their country do not deny like privilege to American citizens. American corporations, some of whose stock is owned by aliens, may make application for lease with a full disclosure of the residence and citizenship of its stockholders, and the department will then determine whether a lease may be granted.

Conflicting Preference Rights Under Sections 19 and 20.

The preference right attaches to the claim first initiated and legally maintained. A locator of a mining claim who has complied with all the provisions of section 19 of the act will be entitled to a preference right over a homestead entryman whose entry was made after the location, the homesteader, however, being entitled to hold the surface right. If the homestead entry was made prior to the date of the placer location, the homestead claimant will have the superior right, except in the case of a stock-raising homestead, wherein all minerals are reserved to the United States.

Permit for Unwithdrawn Land Covered by Agricultural Entry.

No permit will be granted until entryman has elected to take patent with reservation of oil and gas to the United States. If such a waiver is filed, entryman may then exercise his preference right, if any, to permit for lands covered by such entry.

Preference Rights Under Section 20.

Preference rights under section 20 exist in cases where entry was made prior to February 25, 1920, for unwithdrawn or unclassified lands, without any reservation of the minerals by the United

States, and thereafter the claimant files a waiver of his right under the entry to the oil or gas. No preference right exists where land is covered by stock-raising entry, nor where entry is made subject to the act of July 17, 1914, with oil and gas reservations.

Assignability of Permits.

Assignment of a mere right to a permit will not be recognized, but after permit is granted it may be assigned upon consent of the Secretary of the Interior first had and obtained.

Incontiguous Tracts.

Incontiguous tracts within a limited radius may be included in a permit where conditions are such that, because of prior disposals, a reasonable area of contiguous land can not be procured.

Pending Application for Permit, Land Designated as Oil Structure.

Where after application under section 13 for a permit and before permit is granted the land is designated as within the structure of a producing oil or gas field, permit can not be allowed.

Preference Right Under Section 20.

A permit to prospect will be granted an applicant entitled thereto under section 20 of the act, notwithstanding the land is part of a producing oil structure, but only one permit may be granted in the same structure to the same applicant.

Carey Act Segregation as Affected by Leasing Law.

The lands in a Carey Act segregation come under the provisions of section 2 of the oil and gas regulations, and permits and leases may be granted for such lands, subject to such stipulations and requirements as the government may impose for the protection of the reclamation project, to the end that the best development of the lands, both for mineral and agricultural purposes, may be accomplished.

Neither the state nor its contractor would be entitled to any preference right under section 20 of the act, and whether a Carey Act entryman would have such a right would depend upon the conditions affecting his entry being such as to bring him within the provisions of section 20.

Office Practice—Conflicting Applications.

The issuance of a permit should be deferred, where all is regular and the applicant appears entitled to the permit, until the conflicting applicants have been notified that their applications have been rejected, because subsequent in time, subject to the right to show cause or to appeal within 15 days from receipt of notice.

Posting Notice by Agent.

Under the law, the action of an agent in posting notice is the action of his principal, but the application for permit may not be executed by agent, unless applicant is a corporation.

Permits of Corporations as Affected by Stockholders' Permits.

The maximum number of permits to a corporation under section 13 of the act is not limited by permits of individual stockholders, but a corporation may not have an interest in more than three permits in same state, nor in more than one in the same geologic structure, directly or indirectly. An individual may hold a direct interest in not more than three permits and his total interest as permittee and stockholder may not exceed an aggregate of 7680 acres in the same state, or 2560 acres in the same geologic structure.

Preference Right Permits to Qualified Assignees.

Section 19 of the act of February 25, 1920, is construed to permit qualified assignees since October 1, 1919, to secure preference right permits, but no such transferee will be permitted to hold permits exceeding 2560 acres for such lands in the same geologic structure, nor more than three times that area in the same state.

Permits in Alaska.

The same rule applies in Alaska as in the states; that is, not more than one permit in same structure.

Rights Under "Paper Locations."

Arguments have been presented in favor of a construction of section 37 of the leasing act, that would have the result of validating so-called "paper locations" of placer mining claims, and assuring the ultimate right to absolute patent to such claims in case of discovery. Such locations consist merely of setting stakes to indicate the boundaries, posting a notice, and perhaps filing that notice in a proper recording office. It is understood that practically all the public domain having known possible prospective value for oil, is covered by such locations. It is not believed that congress had any such intention or that the language of the act justifies any such conclusion.

Under the express requirements of the mining laws and the decisions of the courts covering a long period of years, *discovery of mineral* has been the sole basis for the location of a mining claim. Without such discovery, the mere posting of notices and marking the boundaries creates no right whatever.

The mining law gives the right to any citizen to explore the public domain for the purpose of finding mineral; hence, the courts have protected a citizen in actual, physical possession of a prospective claim on the public domain, while he is engaged in diligent prosecution of work leading to the discovery of mineral, but this is as far as the courts have gone. As applied to oil lands, this rule was well stated by the Supreme Court of California, in the case of *McLemore vs. Express Oil Company* (158 Cal. 559), in the following language:

But where the location is incomplete no question of assessment work is involved. What the attempting locator has is the right to continue in possession, undisturbed by any form of hostile or clandestine entry, while he is diligently prosecuting his work to a discovery. This diligent prosecution of the work of discovery does not mean the doing of assessment work. It does not mean any attempted holding, by cabin, lumber pile, or unused derrick. It means the diligent, continuous prosecution

of the work, with the expenditure of whatever money may be necessary to the end in view.

These propositions of law were reiterated by the United States Supreme Court as recently as March 15, 1920, in the case of *Cole vs. Ralph*.

From the foregoing it will be seen that no rights whatever could be obtained by mere staking and posting unless such act was followed up with diligent and continuous work leading to discovery. Section 37 of the new leasing act excepts from the operation of that act "valid claims existent at date of passage of this act and thereafter maintained in compliance with the laws under which initiated, which claims may be perfected under such laws, including discovery." Obviously a *valid* claim under the former law is one that the courts and the land department will protect and respect as against the claims of others. The mere staking and posting of notices do not constitute such a claim, and the regulations so hold.

Any other view as to the construction of section 37 is inconsistent with the provisions of other sections of the leasing law. Section 19 provides for relief, so-called, for those persons who initiated claims on the public domain at a time when the lands were not withdrawn or classified, and who, at the date of the act, had not perfected such claims by discovery, and it further provides that where such a claimant had expended an amount equal in the aggregate to \$250 toward the development of his claim, such claimant, if in good faith and the claim was initiated prior to October 1, 1919, would be entitled to a prospector's permit for the area embraced in his claim.

The provisions of the relief section (18, 18a, 19, and 22), were the subject of extended consideration by the committees of congress, and it is clear that the provisions of section 19 are just as far as congress intended to go in the protection of claims and locations of the class here under discussion. To construe the act as validating mere "paper locations" would be placing congress and this department in the position of saying that one who had expended \$250 on his claim would be entitled only to a prospecting permit, while one who had only a stake and notice would be left with the privilege for an indefinite time of ultimately getting absolute title. It is further argued that under the act claimant has the option of taking a relief permit under section 19 or standing on his "paper location" under section 37. One might as logically argue that claims for relief under section 18, over which there has been so much controversy, may now go to absolute patent by virtue of section 37. Congress never contemplated any such anomalous situation.

If the view urged in these arguments were adopted there would be little use for a leasing act for oil lands outside the withdrawn areas, and perhaps for lands within such areas. The purpose and policy sought to be accomplished by this important legislation would be largely negated, and the states and the Reclamation Service would be deprived of funds they are counting on for development purposes. Moreover, there is no practical necessity for the construction urged to protect any legitimate interest. The new law is liberal in the extreme in giving all good-faith claimants, who have made any material expenditures on the ground, fair and reasonable

opportunity to transmute such claims into permits and leases under the new law under far more practical working conditions than existed under the former laws.

Oil Land Leases—Stock-raising Homesteads.

The question has arisen as to whether or not the provisions of section 20 of the leasing act are applicable to lands covered by stock-raising homestead entries.

Section 20 is one of the so-called relief sections of the law, all of which sections are based upon alleged equities of the persons to whom a preference right to a permit or lease is accorded. It was designed to recognize the equities of persons who had gone upon the public domain and made homestead entries under the 160- or 320-acre homestead law, neither of which contains any reservation of minerals, upon the theory and under the belief that they were obtaining an unrestricted title to the land. Because of a *subsequent* withdrawal or classification of the land as mineral after the allowance of their entries, and after they had spent their time and money upon the land, they were under the necessity of either losing the land entirely or accepting a patent under the provisions of the act of July 17, 1914, reserving the oil and gas deposits in the land to the United States. No such equity or reason exists in the case of entries under the 160- or 320-acre homestead law made upon lands *therefore* withdrawn or classified as mineral, because the entryman knew at the time he made the entry that the mineral was known and reserved to the United States, and the most he could obtain was a patent expressly excluding the oil and gas deposits. This is true of all stock-raising homestead entries; for by the terms of the act itself all minerals within the land are expressly reserved to the United States, together with the right to enter upon the lands, mine and remove the same.

Lands within stock-raising homestead entries need not be withdrawn or classified for the purpose of preventing disposition of minerals under the agricultural land laws, because the minerals are reserved in the law itself. It is, therefore, clear that congress, when it used in section 20 of the leasing act, the words "lands bona fide entered as agricultural and not withdrawn or classified as mineral at the time of entry," had in mind only the entries under the 160- or 320- acre homestead law, which contains no reservation or classification of mineral, and where *subsequently*, by reason of a withdrawal or classification, the entryman was, as stated above, under the necessity of accepting a restricted patent. Any other construction of the statute would involve the disregarding of the language "and not withdrawn or classified as mineral at the time of entry."

The regulations specifically state that the preference right under section 20 of the act exists only where the land was entered prior to withdrawal or classification, and *subsequent* to entry was withdrawn or classified as oil or gas bearing in character. This clearly could have no application to entries under the stock-raising homestead law, where all minerals are reserved and where no withdrawal or classification is necessary.

Preferential Rights of Agricultural Claimants.

Whatever preferential rights homesteaders or other agricultural entrymen as such may have to oil permits or leases must be found in section 20 of the act. While this section is not as clear and specific in some respects as might be desired, it is apparent that the class of entrymen or patentees on which congress intended by this section to confer a preference right is those who made their entries when the land was *not withdrawn or classified* as mineral, and who were therefore permitted to make their entries without any reservation of the mineral to the government, but were or will be compelled to take a patent with the reservation because of a withdrawal or classification of the land, or because in the meantime the land has become of known mineral character, before submission of final proof. It is also apparent that this section is in the nature of a relief provision, designed to take care of those who found themselves in the situation above described at the time the act was passed, and not intended to provide generally for the disposition of mineral rights under the homestead law in the future.

With these general propositions in mind, the following specific statements may be made:

1. If the land was withdrawn or classified *at the time of entry* so that the entry was made with a reservation of the mineral, there is no preference right. Conversely, to entitle the homesteader to a preference right the entry must have been properly made *without a reservation* of the mineral.

2. There can be no preference right on an entry allowed after February 25, 1920. See section 12 of the regulations.

3. There can be no preference right on a stock-raising entry under the act of December 29, 1916, for under that act all entries are made with a reservation of the mineral.

4. If the homestead entry was made without reservation of the mineral, but after the lands were of known mineral character, and for the purpose of acquiring mineral rights, there is no preference right to a permit because (a) such an entry should have been made with a reservation of the mineral and the requisite nonmineral affidavit on which the entry was procured was fraudulent, and (b) the entry is not "of lands bona fide entered as agricultural."

5. But where one has an original entry under the 160- or 320-acre law and an additional entry under the stock-raising (640-acre) law, the entryman will have the same rights under the original as he would have had had he not made the additional.

6. Where one has an entry without a reservation of the mineral, nobody (not even the entryman himself) may acquire a permit or lease for the mineral so long as the entry stands in that shape.

7. But if the entryman in the case last above mentioned files a waiver of the mineral rights in the land, then he may exercise his preference right, if he has any, and if not, others may file application for a mineral permit or lease.

8. The "reservation" of the mineral above referred to is pursuant to section 2 of the act of July 17, 1914 (38 Stat. 509), which provides that the mineral occupant shall pay any damage caused to the agricultural claimant.

9. Where a patented entry, or one on which final certificate has issued, has been sold or transferred, the transferee would have the same rights as the entryman, provided he acquired the land before January 1, 1918, but if he acquired it after that date, there would be no preference right in anybody.

10. A patentee, or entryman with final certificate, with a reservation of the mineral to the government, who has a preference right can not withhold the land from development indefinitely. Section 12 of the regulations provides that if anybody else applies for a permit on the land, the preference-right man shall be given notice and allowed 30 days within which to exercise his preference and apply for a permit himself; otherwise he will be out.

11. The preference-right claimant must be qualified to take a permit under the law the same as anybody else; for instance, an alien transferee of patented land

could not get a permit or lease; one who has already received the limit of permits allowed could not get a permit.

12. The matter of whether the agricultural entry on which a preference right to a permit is predicated is within or without a known producing structure cuts no figure in connection with the preference rights here under consideration, provided that only one permit may be granted to the same structure.

13. In case of conflict between a preference-right claimant under sections 18 and 19 and one under section 20 the one would prevail whose rights were prior in their lawful inception.

Conflicts Between Nonmineral Claims and Oil Placers.

When an otherwise valid oil placer location is perfected by discovery the land is not subject to other appropriation so long as the mining claim is maintained, and should it be entered or applied for under some other law prior to the filing of an application for patent by the mining claimant the burden of protecting his claim by contest will rest upon him. This is necessarily so, as the land is not segregated from record entry by a mere mining location of which the land department has no record.

An oil placer location, perfected by discovery, laid over land embraced in a prior, valid, subsisting homestead entry, is ineffective so long as the homestead stands. (Prior to the act of July 17, 1914, the mineral claimant could contest the homestead and cause its cancellation; under that act the homesteader may retain surface rights and the mineral is automatically withdrawn; and under the leasing act the homesteader might have a preference right to a permit for the mineral.) A stock-raising homestead is an exception to this rule, for all minerals are reserved therefrom, and the oil deposits could have been located under the placer law up to February 25, 1920.

A mere "paper" oil placer location (that is, one without a discovery) will not prevent a homestead entry for the land, but where the claimant of a "paper location" is on the ground in diligent prosecution of work leading to discovery at the time the land is homesteaded, he may by contest defeat the homestead entry.

The allowance (after Feb. 25, 1920) of a homestead entry on land covered by valid rights to relief permits or leases under sections 18 or 19, is entirely within the discretion of the Secretary of the Interior.

Reservation of Mineral—When Required.

Where a homestead entry (not under the grazing act) is made without a reservation of the oil to the government and the land is withdrawn or classified as oil land before completed final proof is submitted, the entryman must take patent with a reservation of the oil, unless he can procure a reclassification of the land by the department or a removal of the withdrawal, or unless he can show at a hearing (the burden of proof being on him) that the land was not of a known mineral character at date of final proof.

But where, in the case last stated, the withdrawal or classification as mineral was not made until after final proof was submitted, the entryman will be entitled to a patent without a reservation, unless the government can show (the burden of proof being on the government), at a hearing if necessary, that the land was of known mineral character at the date of final proof. If the government can show

this, the result will be the same regardless of whether there has been a withdrawal or classification.

Interests Under Drilling Contracts.

A drilling contract carrying with it a right in the proceeds, or in the land itself, will be considered an interest in the lease, and when it comes time to grant a lease such drilling contractor will have to show himself qualified to take a lease. In all cases where the drilling is performed under contract the nature and terms of the contract must be disclosed before lease is granted.

As to permits, the situation is different. If a contractor desires to be recognized by the department in connection with a permit, it will be necessary for him to file his contract for approval; but if he so desires he may explore the land under contract with the permittee and bring his contract to the attention of the department only when and if he wishes to be recognized as being interested in such lease as may be applied for.

Discovery on Adjoining Claims.

In case of two claims that adjoin, it is necessary to have discovery on each claim to secure lease for both under section 18. If the discovery is only on one claim, the lease must be confined to the limits of the claim containing the discovery.

Right of Assignees to a Lease Under Section 18.

Good faith locators or their grantees, whose right to a lease is governed by the provisions of section 18 of the act, may transfer their interests to contractors, assignees, or lessees who were in undisputed possession prior to July 1, 1919; and such owners may then jointly apply for a lease for their aggregate holdings or they may make a division of the area and each seek a separate lease for his individual holdings.

Discovery Applicable to All Parts of Location.

A discovery on any part of a placer claim used as a basis for relief under section 18, 19, or 22 of the act will be deemed applicable to every part thereof for leasing purposes.

Only Citizens May Obtain Permits or Leases.

The oil and gas leasing bill provides for the issuance of prospecting permits and leases to citizens of the United States, associations of such citizens, corporations organized under the laws of the United States or of any state or territory thereof, or municipalities. It follows from this that no one but a citizen can obtain a lease or permit, but aliens may be stockholders in some cases.

Citizenship of Agent Immaterial.

A notice of a prospecting permit may be posted by an agent or attorney in fact in the name of his principal. The citizenship of such agent is immaterial.

Oil Claims Antedating Leasing Act.

Oil placer claims for unwithdrawn and unclassified lands upon which discovery was made prior to the enactment of the mineral leasing law are not, in the absence of fraud, affected thereby so long as the claimant complies with the law. If discovery was not made, the claimant in order to protect his right to a patent, must have been engaged in diligent work leading to a discovery at the date of the act and must be able to show that he has continued such work to discovery.

Preference Right of State Grantee.

To entitle the grantee of a state to a preference right under section 20 of the mineral leasing law, the selection must have been approved and transferred by the state prior to January 1, 1918.

(Amended July 14, 1922, by substituting the word "completed" for "approved." 49 L. D. 180.)

When the Mineral Leasing Act Took Effect.

Under the general rule of law applicable to such cases, the act of February 25, 1920, was in force and operation during that entire day, subject, however, to the privilege of any person having a substantial right which would be affected by the application of the general rule to prove, if he can, the exact time of approval.

The act of February 25, 1920, *supra*, section 13, authorizes the Secretary of the Interior, under such rules as he may prescribe, to grant to qualified persons a prospecting permit "upon not to exceed 2560 acres of land," and allows would-be applicants to initiate a preference right, good for 30 days, by posting notice upon the ground. This statute and the rules and regulations promulgated thereunder do not, however, confer upon such locators a right to obtain a prospecting permit for the entire acreage described in any notice of location. The statute simply fixes the maximum amount which may be embraced in a single permit, 2560 acres.

Paragraph 2 of the regulations approved March 11, 1920, states that the granting of such a permit "is discretionary with the Secretary of the Interior, and any application may be granted or denied, either in part or its entirety, as the facts may be deemed to warrant."

Subject to the foregoing, the following rule is announced for the guidance of the officers of the Interior Department and of parties in interest in the disposition of conflicts and controversies arising out of locations and applications made or filed during the day of February 25, 1920:

All locations made or applications filed, pursuant to section 13 of the act of February 25, 1920, at any time during the day of February 25, 1920, will be held, treated, and regarded as simultaneous, and in case of conflict of location and application, in whole or in part, between two or more qualified applicants, all such applicants will be allowed 30 days from notice within which to compromise their differences by division of lands or otherwise, in default of which this department will make such division or disposition as the facts may warrant.

Limitations Under Section 27.

It will be noted that section 27 seems to apply to two classes of interests, namely, those held directly from the government and those held indirectly through ownership of stock in corporations. As to leases held directly, there does not seem to be much doubt that the same person or corporation may not at the same time have more than three leases in any one state, or more than one lease within the geologic structure of the same producing oil or gas field.

The section further provides that "no corporation shall hold any interest as a stockholder of another corporation in more than such number of leases." This language, taken in conjunction with the language preceding it, seems to hold that a *corporation* may not have an interest in more than three leases, either directly as a lessee, or indirectly as a stockholder in a corporate lessee. True, the next clause provides that "no person or *corporation* shall take or hold any interest or interests as a member of an association or associations, or as a stockholder of a corporation or corporations," in which the aggregate leasehold interests exceed an amount equivalent to the maximum number of acres allowed to one lessee. It is clear that as to a corporation the clause last quoted is inconsistent with the clause first quoted, and as the clause first quoted is more restrictive as to a corporation than the following clause, it is considered that the former controls. But this leaves an individual with the right to hold three leases directly, and, at the same time, to have a stock interest in corporations having leases, provided his direct and indirect holdings do not exceed the maximum for one person, namely, not exceeding 2560 acres in the same structure or 7680 in the same state. It follows also that a person may hold stock in any number of corporations holding leases provided his stock interests do not represent a greater acreage than that above stated.

While under the regulations substantially the same restrictions apply to permits as apply to leases, the number of leases one has will not necessarily limit the number of permits he may have, but when a permit ripens into a lease, then the restrictions as to leases apply to both.

Bond With Preference Right Application.

In the case of a preference right application under section 19, the bond may be filed therewith, or deferred until permit is authorized.

Articles of Incorporation.

Under section 25 of the regulations, a certified copy of the articles of incorporation should be filed with the original application, but an uncertified copy is sufficient to accompany the duplicate.

Rights of Association in Geologic Structure.

An association may hold only one permit in the same geologic structure, and the interest of a member of different associations may aggregate 2560 acres in the same structure.

Ceded Ute Indian Lands Subject to Leasing Act.

By departmental decision of August 9, 1920, it was held that the oil and gas deposits contained in that portion of the Ute Indian Reservation in the State of Colorado formerly occupied by the Uncompahgre and White River Utes, ceded to the United States by the confederated bands of Ute Indians by the treaty of March 2, 1868, as amended, accepted, and ratified by the act of June 15, 1880 (21 Stat. 199), and opened to disposal under the provisions of the act of July 28, 1882 (22 Stat. 178), are subject to disposal under the mineral leasing act.

Uintah Ceded Indian Lands Subject to Leasing Act.

The Uintah Indian lands opened to sale and entry by act of May 27, 1902 (32 Stat. 263), are subject to the operation of the leasing act of February 25, 1920.

Procedure in Relation to Agricultural Claims in Conflict With Permits or Leases, or Subject to Preferential Rights.

DEPARTMENT OF THE INTERIOR,

GENERAL LAND OFFICE.

Washington, October 6, 1920.

Registers and Receivers,

United States Land Offices.

GENTLEMEN: Instructions have been requested from several local offices as to the proper procedure to take in connection with non-mineral applications or selections filed for lands embraced in applications for prospecting permits or leases, or which may be subject to preference rights, under the leasing act of February 25, 1920.

A prospecting permit is granted in contemplation of a future lease for a part or all of the same land in case of discovery; hence as to subsequent nonmineral entries, with a reservation of the oil or gas to the United States, the lands embraced in a prospecting permit should be treated the same as if embraced in an oil or gas lease, with a reservation to the United States of the right "to lease, sell, or otherwise dispose of the surface of the lands embraced within such lease under existing law or laws hereafter enacted, in so far as said surface is not necessary for the use of the lessee in extracting or removing the deposits therein," pursuant to section 29 of the leasing act. As the placing of such a reservation in a lease is made discretionary with the Secretary, it necessarily follows that any disposition of the surface of lands embraced in permits or leases is by the act left entirely discretionary with the land department, to be determined on the facts of each particular case.

The so-called relief sections of the act (18, 18a, 19, and 22) recognize equitable rights in the owners and occupants of claims initiated under the general mining laws and accord to them a preference right which may be exercised by applying within the time and in the manner prescribed by said sections for oil or gas leases or permits. These

prior rights or claims, if asserted within the time accorded the claimants by the statute, are superior, both in time and right, to nonmineral applications or selections having their inception subsequent to the leasing act. It is apparent also that the allowance of nonmineral appropriation of the surface of vacant lands in producing structures will interfere with the leasing of such lands by competitive bidding under section 17 of the leasing act.

You are therefore directed:

LANDS OUTSIDE PRODUCING STRUCTURES.

(1) In all cases of applications to make nonmineral entries or selections of lands *outside* of areas which have been designated by the department as within the geologic structures of producing oil or gas fields, and which lands are also embraced in applications for prospecting permits or in permits granted, such nonmineral applications should be received, noted on your records, suspended, and transmitted to the Commissioner of the General Land Office for instructions. If in any case such nonmineral entry or selection shall be allowed by you on instructions from the Commissioner, the same will be with a reservation of the oil or gas to the United States, and subject to the rights of the permittee or lessee, as the case may be, to use so much of the surface of such land as is necessary in extracting and removing the mineral deposits, without compensation to the nonmineral entryman for such use, in accordance with section 29 of the leasing act.

LANDS IN PRODUCING STRUCTURES.

(2) You will reject all applications to enter, file upon, or select under the nonmineral land laws, lands which have been or shall be designated by the department as being *within* the known geologic structures of producing oil or gas fields, pending consideration by the department of the agricultural character and value of such lands and a determination as to whether the surface of the land is of agricultural character and value and may be disposed of without detriment to the public interest.

CONFLICTS WITH PREFERENCE RIGHTS.

(3) All homestead entries or other nonmineral filings or selections *allowed* prior to receipt of these instructions and subsequent to February 24, 1920, which are found to be in conflict with preference rights timely asserted under the remedial provisions of the act of February 25, 1920, shall be suspended pending the consideration of the application for the permit or lease, and the parties in interest so advised. If the permit or lease be allowed or granted, such homestead entry or other allowed nonmineral application or selection will be canceled if the lands are within designated geologic structures of producing oil or gas fields. If outside of such designations, the agricultural entries, applications, or selections will be allowed to stand or will be canceled in the discretion of the department, as provided in section 1 hereof.

LIABILITY FOR DAMAGES.

(4) Your attention is drawn to the distinction which exists under the law with respect to the rights of permittees and lessees of mineral deposits in cases where the nonmineral entry or selection is allowed subsequent to the application for permit or lease or subsequent to February 25, 1920, in conflict with rights recognized by sections 18, 18a, 19 and 22 of the leasing act, and those cases where the nonmineral entry, filing, or selection with a reservation of the mineral (either at time of entry or later) under the acts of July 17, 1914 (36 Stat. 509), or December 29, 1916 (39 Stat. 862), precedes the permit, lease, or mineral right, for in the latter case the nonmineral claimant is entitled to be reimbursed for all damages to crops and improvements by reason of the operations of the permittee or lessee, as provided in those acts, while in the former the respective rights of the mineral and surface claimants are governed by section 29 of the leasing act.

Very respectfully,

CLAY TALLMAN,
Commissioner.

Approved October 6, 1920.

JOHN BARTON PAYNE,
Secretary.

NOTE.—For regulations governing oil and gas permits and leases in Alaska, see 49 L. D. 196, 207.

**Regulations Governing Payment of Annual Rental Under Oil and Gas Leases
Required by Section 14 of the Act of February 25, 1920.**

[Circular No. 795.]

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE,

Washington, D. C., December 8, 1921.

Registers and Receivers,

United States Land Offices.

Section 14 of the act of February 25, 1920 (41 Stat. 437), relative to oil and gas leases, provides for the payment in advance of an annual rental of \$1 per acre in cash on the acreage covered by the lease, the rental paid for any one year to be credited against the royalties as they accrue for that year.

For the purpose of establishing a uniform practice of handling this rental problem the following rules are prescribed:

1. On the first day of each year of the lease, reckoned from the date stated in the first paragraph thereof, the annual rental becomes due and payable in cash. This must be paid directly to the receiver of public moneys of the land district in which the land is situated. (See Big-4 Oil Co. 49 L. D. 482.)

2. In the event the royalty is to be paid in cash, the lessee shall deduct from royalty payments to the local receiver the amount of the rental paid for that year from the first royalty due, until the accrued royalty equals the annual rental paid.

3. If the royalty is to be paid partly in crude oil and partly in cash, the entire deduction necessary to offset the rental paid shall be taken from the first accrued cash royalty only.

4. If the royalty is to be paid in kind only, the lessee shall deduct from the first accrued royalty product such quantity thereof as will, at the approved selling price on the date of deduction, equal in value the cash rental paid for that year.

Amended February 24, 1923, to read as follows:

“4. If the royalty is to be paid in kind only, the lessee shall deduct from the first accrued royalty product such quantity thereof as will, at the approved selling price on the date of deduction, equal in value the cash rental paid for that year: *Provided, however*, that by consent of the lessee the amount of annual rental paid in any one year may, in lieu of being refunded in oil, continue to be held by the government as a deposit through succeeding years subject to correction if the acreage of the lease shall change or to refund of any amount due when the lease shall terminate. 49 L. D. 459.”

5. The date, amount and character of deduction made to offset rental payments must be shown in the itemized monthly statement required in the lease covering the month when the deduction is made.

WM. SPRY,
Commissioner.

Approved:

F. M. GOODWIN,
Assistant Secretary.

Applications for Leases by Oil and Gas Prospecting Permittees Under Section 14, Act of February 25, 1920.

Instructions.

[Circular No. 823.]

DEPARTMENT OF THE INTERIOR,
GENERAL LAND OFFICE,

Washington, D. C., May 5, 1922.

*Registers and Receivers,
United States Land Offices.*

In order to expedite and coordinate the work of the General Land Office and of the Bureau of Mines in acting upon applications for leases filed under section 14 of the act of February 25, 1920 (41 Stat. 437), by the holders of oil and gas prospecting permits, you are instructed as follows:

LEASES FOLLOWING PERMITS.—An application for lease as a reward for discovery by permittees shall be filed in duplicate in the United States land office of the district in which the land is situated. The register and receiver will immediately transmit the original to the Commissioner of the General Land Office, by special letter, and the duplicate to the deputy supervisor of the Bureau of Mines having jurisdiction in the district.

Such applications should set out the following items:

- (1) Serial number of permit.
- (2) Name and address of permittee.
- (3) Name and address of operator.
- (4) Subdivisions on which discoveries have been made. Character of discoveries. Exact date of discovery.
- (5) Number and definite location of each well brought in.
- (6) Complete itemized production statement by calendar months from first discovery to date of application.

(7) The applicant must give description of the land for which he desires a lease at the minimum royalty accorded discoverers under permits. He must also at the same time apply for lease of the remaining lands covered by the permit, or waive claim to his preference right to lease same or such part thereof as he does not desire to lease. A permittee under section 13, and a permittee under section 19 of the act (for lands not within the known geologic structure of a producing oil and gas field at the date the permit application was filed) is entitled to lease one-fourth of the land in the permit, or at least 160 acres, if the permit includes that area, at a flat royalty of 5 per cent. If a permit under section 19 includes areas which were at the date the permit application was filed partly inside and partly outside the known geologic structure of a producing oil and gas field, the permittee is entitled to select one-fourth of the area for lease wholly outside, or wholly inside, or partly inside and partly outside the known structure, *provided, however*, that the royalty on lands within the known structure shall in no event be less than $12\frac{1}{2}$ per cent. and *provided, further*, that the permittee is entitled to a lease at 5 per cent flat royalty upon so much of the outside area as does not exceed one-fourth of the total area covered by the permit.

A permittee under section 20 of the act is entitled to lease one-fourth of the area of land embraced in his permit or at least 160 acres of said lands, if there be that number of acres within the permit, at a flat royalty of 5 per cent, whether the land covered by the permit, or any part thereof, was within or without the known structure of a producing oil and gas field at the date the permit application was filed.

(8) A statement of what interests are to be held under the lease, together with (a) the necessary contracts, assignments, etc., for the approval of the Secretary of the Interior; (b) proof of citizenship of any assignee or interested party by affidavit of such fact if native born, or, if naturalized, by certified copy of the certificate of naturalization on the form provided for use in public land matters unless such copy is already on file, or, if a corporation, by certified copy of the articles of incorporation, and a showing as to the residence and citizenship of its stockholders; (c) a statement as to interests held by the assignee or interested party in leases and permits in the geologic structure of the same producing oil or gas field. If the showings required under (a) and (b) have already been made, a reference thereto may be made giving the land office district and serial number of the case in which the showings were made.

The permittee must exercise his preferential right to the remaining part of the permit at the time of application for lease of the one-fourth part of the area affected.

RELINQUISHMENTS AND BONDS.—Relinquishments of permits will not be accepted and bonds released until all requirements under the permits and the regulations have been fulfilled. When any drilling has been done on the property, the relinquishment should be approved by a representative of the Bureau of Mines or other person so designated by the Secretary of the Interior.

ABANDONMENT OF WELLS.—Upon plugging or abandoning a well drilled under a permit or lease, the casing shall not be drawn from the well until authority has been obtained in writing from the deputy supervisor of the Bureau of Mines or other authorized agent of the Department of the Interior.

SALES CONTRACTS.—Sales contracts submitted for the approval of the Secretary of the Interior under paragraph 2 (d) of the lease must be filed in duplicate with the deputy supervisor of the Bureau of Mines having jurisdiction in the district in which the leased land is situated. The deputy supervisor will retain the duplicate in his files and forward the original, together with a copy of his report, to the Commissioner of the General Land Office. The original report of the deputy supervisor will be transmitted to the Director of the Bureau of Mines.

If a sales contract is submitted to any official of the Interior Department other than the deputy supervisor without its having been approved by the deputy or other authorized official, the contract should be returned to the person submitting it with instructions to file it in duplicate at the office of the local deputy supervisor, who will handle it in the regular manner.

WILLIAM SPRY,
Commissioner.

Approved:

E. C. FINNEY,
First Assistant Secretary.

APPENDIX—FORMS.

Form No. 1.

APPLICATION FOR PROSPECTING PERMIT.

(Act of Feb. 25, 1920.)

Department of the Interior

Land Office at -----

State of----- }
 County of----- } ss.

The Honorable -----

The Commissioner of the General Land Office:

And now comes ----- of -----,
 and hereby applies for a prospecting permit for the exclusive right for
 a period of two years to prospect for oil or gas upon the following
 described lands, situated in the State of-----, or
 so much of it as may be public lands, or may be presumed to contain
 deposits of oil or gas, belonging to the United States, to wit:

DESCRIPTION.

In support of this application-----sets forth
 the following facts:

(a) The applicant's name is-----, and
 his business address is-----.

(b) That ----- is a ----- citizen of the United
 States and he files herewith an affidavit substantiating such fact.

(c) That the applicant is not the holder of and has no direct or
 indirect interest in any other subsisting permit within the State of
 -----, but holds one permit to prospect for
 oil or gas in the State of -----.

(d) That the land for which the permit is desired is that heretofore
 described by legal subdivision.

(e) That the applicant believes that the land described in this appli-
 cation can be reasonably presumed to contain deposits of oil and gas.

That the prospecting permit applied for does not include to exceed
 2,560 acres of land, and that said land is not within any known geo-
 logical structure of a producing oil or gas field.

(f) That it is the intention of the applicant to explore the said tract
 by drilling of wells on such spot or spots as may be judged the most
 advantageous, and he will show due diligence in the said work of
 exploration, and that he has at his command the necessary capital for
 the intended drillings and explorations; that he is ready to satisfy the
 Secretary of the Interior as to his financial responsibility in such manner
 as the said Secretary of the Interior may desire.

(g) That the applicant is an-----and oil operator, has a
 recognized business standing and refers to the following:-----

(h) That this application is accompanied by a bond of-----with

qualified surety in the sum of One Thousand Dollars (\$1,000.00), conditioned against a failure of the permittee to repair promptly so far as possible any damage to the oil strata or deposits resulting from improper methods of operation.

This application is made in accordance with the terms of the "Act to promote the mining of coal, phosphate, oil, oil shale, gas and sodium on the public domain," approved February 25, 1920.

IN TESTIMONY WHEREOF, the said applicant----- has caused his name to be signed as of the day and year first above written. Subscribed and sworn to before me this----- day of -----

Notary Public

My commission expires-----

NOTE.—For documents to be filed together with 'Application' see Oil and Gas Regulations, par. 4, *supra*.

Form No. 2.

NOTICE OF LOCATION AND NOTICE OF INTENTION TO APPLY FOR PROSPECTING PERMIT UNDER ACT OF CONGRESS APPROVED FEBRUARY 25, 1920.

NOTICE IS HERBY GIVEN that I, -----, a resident of -----, and a citizen of the United States of America, over 21 years of age, have located and do hereby locate under the provisions of an act of the 66th congress of the United States, approved February 25, 1920, the following land situate in the -----, County of -----, State of -----, particularly described as follows, to-wit:

(DESCRIPTION.)

That said land is located for the purpose of prospecting thereon for oil and gas under the provisions of said act of congress and

NOTICE ALSO IS HEREBY GIVEN that I, -----, the locator above named, will within thirty (30) days after the date of posting this notice on said property above described, to-wit, within thirty (30) days after the----- day of -----, make an application to the Secretary of the Interior of the United States, under and pursuant to the provisions of said act of congress, a permit to prospect for oil and gas upon said land.

WITNESS MY HAND AND SEAL this ----- day of ----- (Seal)

WE HEREBY CERTIFY that the above and foregoing notice of location and notice of intention to apply for prospecting permit was posted on the above described land on a monument over four feet high, near the ----- corner of the ----- of Section -----, Township -----, Range -----, ----- Base and Meridian, County of -----, State of -----, on the ----- day of -----, 19--.

 Serial No. _____ FOR PERMIT TO PROSPECT AND FOR OIL
 LEASE UPON THE _____
 BASE AND MERIDIAN,

and
 IN THE MATTER OF APPLICATION OF _____
 Serial No. _____ FOR PERMIT TO PROSPECT AND FOR OIL
 LEASE UPON THE _____ BASE
 AND MERIDIAN.

PROTEST OF _____

Comes now _____ of the County of _____
 State of _____, whose post-office address is _____
 in said _____ County of _____, and hereby protests
 and objects to the allowance of the application of the _____
 (Serial No. _____, Series) and of the applica-
 tion of _____ (Serial No. _____, Series),
 each of said applications being for permit to prospect and for lease of
 the _____ Base and Meridian,
 under the act of congress approved February 25, 1920, and objects to
 and protests against the allowance of any part or portion of said applica-
 tions or either of them, or of any other application of any person, except
 this protestant, relating to said land or any part thereof upon the
 following grounds, to wit:

1. That this protestant was on _____, at the time of the
 passage of said act of congress above mentioned, and for a long time
 prior thereto, had been and ever since has been and now is the owner of
 and possessed of a right to a patent to the said land above described and
 the whole thereof, under the placer mining laws of the United States.

2. That this protestant was at the time of the passage and approval of
 said act of congress, ever since has been and now is the owner of and
 possessed of a superior right to a lease under the provisions of said act
 of congress, to the said land described and the whole thereof.

The facts concerning this protestant's claims and interests in said
 land above described and his right to a patent and lease thereto as afore-
 said, are in substance as follows, to wit:

1. This protestant is a _____ citizen of the United States, over
 the age of twenty-one years and now is and was at all times herein
 mentioned a resident of the State of _____. That he now does
 and did at all said times reside in _____.

2. This protestant now is and during all the times since a date long
 prior to July 3, 1910, has been, through himself and his predecessors in
 interest, continuously, a *bona fide* claimant of, and in the possession,
 undisputed by any other claimant prior to July 1, 1919, or since said
 last named date, of the following described parcel of land, and of the
 oil and gas wells located thereon, under claims initiated prior to July 3,
 1910, by his predecessors in interest of the said placer mining claim
 hereinafter described, respectively upon the date hereinafter set forth,
 under the preexisting placer mining laws of the United States; and said

parcel of land, including all of the oil and gas wells located thereon have been claimed and possessed by protestant and his predecessors in interest continuously since prior to said 3d day of July, 1910, and for a long time prior thereto.

Said parcel of land so claimed and possessed as aforesaid is situated in the County of _____ of _____, and is more particularly described as follows, to wit:

----- PLACER MINING CLAIM.

Being the ----- Base and Meridian.

3. The above described parcel of land was embraced in the Executive Order of Withdrawal of September 27, 1909, and ever since has remained so withdrawn. The said parcel of land is situated within Petroleum Reserve No. ----- and is not within any Naval Reserve.

4. That the origin and basis of protestant's rights and interests in and to said parcel of land and of his claim for relief under said act of congress are as follows:

That on the 16th day of February, 1909, the said parcel of land above described was public land of the United States open to location and appropriation under the laws of the United States relating to lands commonly known as "Placers" and lands chiefly valuable for petroleum, and on said date ----- and -----, each then being a citizen of the United States, duly located said parcel of land under said laws as the ----- PLACER MINING CLAIM and entered upon and took possession of said parcel of land, and did duly post thereon a notice of location, and did duly file for record, and there was recorded, on the -----, in the office of the County Recorder of -----, in Book ----- of the records of such county, said notice of location; that said notice of location was posted and filed and recorded by the above named locators in good faith and for the purpose of acquiring said land and the minerals contained therein for themselves and not for the benefit of any other person or persons.

That thereafter and during the month of -----, the said locators commenced the work of developing said land for oil and diligently continued in the possession of said land and in said development work at all times up to and including and after the -----, on which last mentioned date oil was discovered on said placer mining claim in paying quantities.

That thereafter by deed dated -----, and recorded -----, in the office of said County Recorder in Book ----- of Deeds, at page -----, Records of -----, this protestant became the owner of and acquired all of the right, title and interest of all of said ----- locators above named except -----, and now is the owner thereof. That the said ----- died on or about the ----- day of -----, and the whole of the estate of said ----- was by decree of distribution duly given, made and entered by the ----- Court of the -----, State of -----, County of -----, in the matter of the estate of -----, deceased, and in and by the decree of distribution in said estate, distributed to and vested in ----- Said decree of distribution was given, made and entered by said ----- Court on the -----, and was recorded in

the office of the said County Recorder -----, on ----- in Book ----- of ----- records of said County.

That thereafter by deed duly executed and delivered by said ----- to this protestant, this protestant acquired and became the owner of all the right, title and interest of said locator, -----, and of said -----, and ever since has been and now is the owner thereof. Said deed is dated -----, and recorded -----, in Book ----- of Deeds, ----- records of said County.

All of which will more fully appear from the abstract of title covering said parcel of land filed herewith.

5. Commencing in the month of -----, the following work was performed and improvements made, purchased, constructed and installed on said parcel of land, to wit:

(Insert details.)

That on -----, protestant and his predecessors in interest were and for several months prior thereto, had continuously been *bona fide* occupants and claimants of said placer mining location and were on said last mentioned date and for several months prior thereto had continuously been in the diligent prosecution of work leading to the discovery of oil or gas, or both, on said placer mining claim and diligently and continuously continued said work until subsequently oil was discovered in paying quantities on said placer mining claim as is hereinafter more particularly set forth.

6. That actual drilling was commenced on said land on the ----- day of -----, and was thereafter diligently continued until -----, when at a depth of ----- feet a discovery of oil and gas was made. The drilling of said well was continued diligently until -----, when at a depth of ----- feet a further discovery of oil and gas in paying quantities and in a producing stratum on the land covered by said location was made. Oil was produced from said well to the extent of ----- barrels. Said well was then cased off, drilling was resumed thereon and continued diligently to a depth of ----- feet.

7. That said well has been drilled, constructed and now exists upon said parcel of land, said well having been constructed, drilled and developed by this protestant and his said predecessors in interest. No other well or wells have been constructed or drilled or now exist upon said parcel of land or any part thereof. The said well is of the depth of ----- feet. Said well is not now actually producing oil or gas. After discovery of oil as hereinbefore set forth, and after said well has been drilled to said depth of ----- feet it was left in a condition so that the oil and gas therein would remain undisturbed and undamaged and said well was then capped so as to retain the oil and gas therein. Said well is in such a condition that oil may be produced therefrom and it is the intention of this protestant upon the allowance of the said application for lease, to commence the production of oil therefrom.

That the total amount of oil actually produced and taken from said well is ----- No technical test of the grade of said oil was made but protestant is informed and believes and therefore states that said oil was of from ----- degrees to ----- degrees baumé. No other oil or gas has been taken from said well and all said oil was either consumed for production purposes on the land or unavoidably lost.

That filed herewith and made a part hereof is a diagram marked Exhibit "A," showing the position of said well by course and distance from the nearest corner to the ----- Base and Meridian.

8. That there has been expended in improvements, labor and equipment for the said development of and operations upon said parcel of land including the actual cost of the well thereon, hereinbefore described, a sum in excess of \$----- That a detailed statement showing the actual cost of the said well and of the improvements, labor and equipment for the development of and operations upon said land, is fully set forth in the application of this protestant for relief under said act of congress, which said application is Serial No. -----, and reference to which is hereby made.

9. That as appears from the abstract of title hereinbefore referred to, this protestant is and was on and prior to -----, subject to the paramount title of the United States, the owner of the aforesaid placer mining location covering said parcel of land above described and the whole thereof, and the oil and gas well located thereon. That there are no conflicting claims asserted prior to -----, or subsequent to said date against said placer mining location or said well located thereon, and protestant's possession is undisputed by any other claimant prior to -----; that this protestant has not acquired any interest in said parcel of land or in said location since -----, from any claimant, who, on or since said last mentioned date claimed or held more than the maximum area allowed the claimant under the provisions of section 18 of said act of congress.

Protestant has filed no application other than said application hereinbefore mentioned, for any lease or permit under said act of congress, and has no interest direct or indirect, in any other application for lease or permit by stock ownership or otherwise except that this protestant -----

10. That said land is situated within the Geological Structure or oil field known as -----, in the County of -----, State of -----.

11. That protestant has not been guilty of any fraud and never has had and has not now any knowledge or reasonable grounds to know of any fraud in connection with said placer mining claim and has at all times acted honestly and in good faith; that protestant does now and did at all times believe that said placer mining location had been made in good faith by the several locators thereof and that the work done and improvements constructed upon said land constituted a compliance with the law and that said work and improvements followed by said discovery of oil, entitle this protestant to patent for said land.

12. That protestant on the -----, duly prepared and filed in the United States Land Office at -----, his verified application for lease of said parcel of land under said act of congress, which said application is now pending in the said United States Land Office and is Serial No. -----, Series; that in the preparation and filing of said application and as a part of the proceedings connected therewith, this protestant has complied with each and all of the requirements of the said act of congress, and the rules and regulations of the Department of the Interior thereunder, and has done and performed each and everything requisite thereunder to entitle him to a lease under the provisions of said act of congress, of all of said parcel of land above

described. A copy of said application has been heretofore served upon said _____, above named, and reference is hereby made to the original of said application and the same is made a part hereof.

WHEREFORE, this protestant prays that the applications of said _____, (Serial No. _____, Series) and of _____ (Serial No. _____, Series) for permit to prospect and for lease of said parcel of land above described, and each and every part thereof and all other applications adverse to the rights and claims of this protestant, be denied and dismissed and that the claims of this protestant as hereinbefore set forth be confirmed and that he may have such other and further relief as may be meet in the premises.

Protestant.

Attorney for Protestant.

of -----, ----- County, -----, as the case may be), a
citizen (or citizens) of the United States, or having declared my (or
our) intention to become a citizen (or citizens) of the United States,
as principal (or principals), and -----, of -----, ----- County,
-----, and ----- of -----, ----- County -----, as sureties,
are held and firmly bound unto the United States of America, for the
use and benefit of the hereinafter-mentioned entryman or owner of the
hereinafter-described land, whereof homestead entry has been made sub-
ject to the act of December 29, 1916 (39 Stat., 862), in the sum of -----
dollars (\$-----), lawful money of the United States, for the pay-
ment of which, well and truly to be made, we bind ourselves, our heirs,
executors, and administrators, successors, and assigns, and each and
every one of us and them, jointly and severally, firmly by these
presents.

Signed with our hands and sealed with our seals this ----- day of
-----, 19--.

The condition of this obligation is such that, whereas the above-
bounden ----- has acquired from the United States
the ----- deposits (together with the right to mine and remove
the same) situate, lying, and being within the ----- of sec. -----,
township -----, range -----, ----- land district, -----,
and whereas homestead entry, serial No. ----- has been made at
----- land office, of the surface of said above-described land, under

the provisions of said act of December 29, 1916, by-----.

Now, therefore, if the above-bounden parties or either of them, or the heirs of either of them, their executors or administrators, upon demand, shall make good and sufficient recompense, satisfaction, and payment unto the said entryman or owner, his heirs, executors, or administrators, or assigns, for all damages to the entryman's or owner's crops or tangible improvements upon said homesteaded land as the said entryman or owner shall suffer or sustain or a court of competent jurisdiction may determine and fix in an action brought on this bond or undertaking, by reason of the above-bounden principal's mining and removing of the ----- deposits from said described land, or occupancy or use of said surface as permitted to said above-bounden principal under the provisions of said act of December 29, 1916, then this obligation shall be null and void; otherwise and in default of a full and complete compliance with either or any of said obligations, the same shall remain in full force and effect.

Signed and sealed in the presence
of and witnessed by the under-
signed:

Principal.

NOTES ON THE LAW OF MINING LOCATIONS AND LANDS
OPEN TO MINING IN CALIFORNIA.

By C. A. LOGAN.

One of the most frequent subjects of inquiry at the offices of this Bureau is the matter of mining law, as applied to the proper procedure for locating claims and holding same. The State Mining Bureau has published various bulletins on the subject, but stock of these is at present exhausted. The following notes are intended to make available for reference the main points of federal and state laws prescribing the methods to be followed in taking up mining claims on vacant public lands within this state, with some notes on lands available for mining.

These notes are based in the main upon those parts of the statutes which are of direct interest to the prospector who wants to make his location legal, and the writer has tried to avoid any technical or theoretical considerations not directly touching upon these details. Therefore no mention is made of the extralateral right nor of the other legal sinuosities that may arise. At the same time, it is believed that if the simple points mentioned are carefully attended to in making out the location notice and laying out the claim, the locator will avoid most of the dangers and vexations that later befall him when his location is faulty. The subject of mining law is a complex one, of such scope as to call for extended study by anyone who would master it. For a complete reference book on the subject the reader should consult Lindley¹ or one of the other standard authorities. An excellent reference book, much smaller but covering practical points, is Wilson's *Mining Laws*; also Ricketts' *Manual of American Mining Law*.

In preparing the following notes the writer has drawn freely upon lecture notes taken while attending a course of lectures delivered at the University of California by William Colby, mining attorney, to whom acknowledgement is here made. Lindley on Mines has also been used, as have numerous federal and state circulars dealing with the details concerned. Cases could be cited for most of the points covered.

Summarizing the requirements of the United States and California statutes, as applied to lode mining locations upon vacant government land within this state, it will be noted that the following indispensable requirements must be met in order to fully protect the interests of the claimant:

(1) Discovery, the most vital factor, which must precede location or any rights thereunder. (Federal and state requirement.)

(2) The location must be marked upon the ground so that the boundaries of the claim or claims can be readily traced by anyone coming on the property and desiring to know what land is claimed. (Federal and state requirement.)

(3) Where the state or district mining law requires that a record of

¹Lindley on Mines. A treatise on the American law relating to mines and mineral land, by Curtis H. Lindley, San Francisco, 1914.

the location be kept, the federal statute requires that this record must contain the following details:

1. The name of the lode or claim.
2. The name of the locator or locators.
3. The number of linear feet claimed in length along the course of the vein, each way from the point of discovery, with the width on each side of the center of the claim, and the general course of the vein or lode, as near as may be.
4. The date of location.
5. Such a description of the claim by reference to some natural object, or permanent monument, as will identify the claim located.

The state law incorporates these provisions of the federal statute, word for word.

(4) The state law (see paragraph 1426, *post*) specifies that a location notice must be posted upon the claim at the point where the discovery of valuable mineral is made, and that this notice must contain the information called for under the five divisions of the last paragraph.

(5) The state law also requires that a copy of the above notice must be filed for record within 30 days of the date of posting, in the office of the county recorder of the county in which the claim is situated.

Differing from the lode location requirements, the state laws regarding placer claims specify that where placer claims are taken by location according to the subdivisions of the public land survey and where the location notice specifies the legal subdivision of section, township and range, the boundaries of a claim so located and described need not be staked nor monumented. A prudent locator will, however, always stake his claim and when describing the same as above mentioned will ordinarily need at least an approximate survey to be sure the notice properly describes the land intended to be claimed.

Importance of Discovery in Initiating the Locator's Rights.

Upon a lode claim, discovery is defined as the actual finding of *ore in place*, not as float. The value of the ore is not a controlling factor, but the test is, according to Colby,² "would a prudent man be justified in spending money to develop it?" (See *Brook vs. Justice Mining Co.* 58 Fed. p. 120.)

While it has been remarked that the order in which the various steps required to complete a valid location is not necessarily invariable, it may be said in general that the claim is not safely secured against rival locators until a valid discovery of mineral has been made. Court decisions on the point have been at variance. In this state the first locator may get an injunction forbidding the second from coming upon the claim, pending decision of the matter. This would apparently give the first locator an advantage in the "race of diligence" to reach the mineral first. Prior possession is an important factor.

Where there is a contested area claimed by two or more locators, the senior locator might make a valid discovery of mineral in the contested area, but the junior locator or locators could not ordinarily

²W. E. Colby, Attorney-at-law and Lecturer on Mining Law, University of California.

do so, unless the senior locator so far forgot his own interests as to fail to take proper steps to prevent it. This point arose in a recent case decided by the local land office.

Neither the federal law nor the California statutes require that any particular form of opening or any certain amount of work be done to complete a valid discovery.

Marking the Claim, and the Shape of Claim.

In this state no particular manner of marking out the claim boundaries is required, but it is desirable to have substantial stakes at the four principal corners, the end centers, the discovery point and also at points where the side lines make angles. This of course refers to the location marks and not to the final survey for patent. While it is not absolutely necessary that such markers be maintained by the locator, it of course is advisable to keep such markers in place both for his own protection and as a matter of justice to other prospectors who may be seeking minerals in the same locality.

The ideal quartz mining claim, which will give the largest area allowed by the federal statute and the fullest exercise of the extralateral right, is 1500 feet long by 600 feet wide, and is a right-angled parallelogram with the side lines parallel to the lode and the end lines crossing the lode at right angles. The claim cannot extend more than 300 feet on each side of the center of the vein, measured at right angles to the side lines. The end lines must be parallel straight lines, but the side lines need not be either parallel or straight, and if the vein is sinuous, the side lines should follow it. Care should be exercised to see that the claim is so taken that the vein does not depart from the claim through a side line, as this would result in greatly cutting down the length of the claim and would curtail the exercise of the extralateral right, possibly with very serious loss to the locator. The law will give the locator only so much of the vein along the strike as he has of the apex within the boundaries of his claim. The end lines do not have to be of equal length and do not have to cross the vein at any particular angle. The possession of the apex within the boundaries of the claim is essential to the enjoyment of the extralateral right downward on the dip of the vein.

Form of Location Notice. Posting the Notice.

Neither the Federal nor the California statutes require any particular *form* that need be followed in writing the location notice, and it is not necessary to use any particular printed blank, although the blank is convenient and often safer as its use insures that attention will be called to the information required, preventing the omission of some important detail. Suggested forms that may be used as models in writing out either lode or placer location notices are shown herewith.

The courts as a rule have been liberal in dealing with the question of form of location notices, and as a rule inquire rather into the good faith of the locator than into the form of his notice. The notice must contain the details given under the five headings of paragraph 3. under requirements. The signatures of witnesses on the location notice naturally strengthen it in case of dispute, although not specifically required in California, and if it happened that two or more rival

locations were attempted upon the same claim on the same day, it would prove of value to show the hour of the posting. If the position of the claim with regard to section, township and range is known this should be shown. The old mining districts with their district recorders have become extinct, with possibly one exception, in this state.

The location notice must be posted at a conspicuous place on the claim, as it is intended to be a notice to all the world that the ground claimed has been removed from the public domain for mining purposes. It will be noted that the state law regarding placer locations says the location notice may be posted upon a tree, rock in place, stone, post or monument, and does not specifically mention that it is to be put at the point of discovery. As a matter of prudence, but not specifically required by law, the location notice should be maintained upon the claim. The test of the sufficiency of a location notice would be to take the notice as posted and recorded, and in the absence of stakes or lines, trace out the boundaries of the claim from the recorded description.

Assessment Work. Proof of Labor. Delinquent Colocator.

The annual assessment year now begins at noon, July first. The locator of a claim has one full year, beginning at noon of July first, next following the date of his location, during which to perform the first year's assessment work. One hundred dollars worth of labor must be done or improvements made upon each claim per annum. The test of the validity of assessment work done is: Does it facilitate the extraction of valuable mineral from the claim?

Three classes of work may be valid as assessment work or for credit toward the \$500 requirement for patent. (1) Work within the boundaries of the claim for the purpose of actually developing the mineral deposits in the claim. This may consist of excavation, drilling, erection of works *for mining* or placing of machinery for use *in mining*, the development of orebodies, or the actual extraction of mineral. A quartz mill does not satisfy the assessment requirement on a lode claim, but a dredger does on a placer claim. (2) Work on a group of claims for the joint benefit of all, by virtue of the community of interest between locators or an agreement between locators of adjoining claims. (3) Work outside of a claim or group of claims, when such work tends to facilitate the extraction of valuable mineral from the claim or claims. This includes tunnels for the development of deposits above the line of tunnel; roads and trails, and the making of flumes and ditches to conduct water to placer mining claims.

As regards requirements of assessment work, an association placer, taken up as a unit by locators, may be considered as a single claim, though containing more than 20 acres. All the assessment work for a group of adjoining claims may be done upon one claim if conclusively shown to benefit the entire group, and if \$100 is expended for each claim. The term "group of claims" as here used, is applied to a number of claims taken up by locators and regarding which it was understood at the time of location that they were being so taken.

The proof of labor is an affidavit made by the owner of the claim or by some one in his behalf, acquainted with the facts, setting forth that during the year in question, certain amounts (not less than \$100

for each claim) have been expended for labor upon or for improvements upon the claim named. This affidavit must be filed for record in the office of the county recorder of the county in which the claim or claims are situated, within 30 days after July first each year (except as before mentioned for the fraction of a year between the date of location and the next July first.)

The California statute (see paragraph 1426s herewith) provides that the failure or neglect of any locator of a mining claim to perform assessment work as specified in the United States statutes shall disqualify such locator from relocating such claim or any part thereof within three years of the date of his original location, and any such attempted relocation is declared void. To prevent location of such a claim by others, such a delinquent locator would have to go upon the claim and prosecute his work to completion.

The United States statutes (section 2324 herewith) provide the general manner in which one locator of a claim who keeps up the assessment work on the claim may obtain relief from his fellow locators who fail to pay their shares of such expense. The California statute (paragraph 1426o herewith) sets forth in detail the procedure to be followed in serving or publishing the notice to the delinquent party, and the steps the delinquent may take to protect his interests within the 90-day period allowed him. Failure of such delinquent coowner to meet his share of the cost of assessment work within 90 days after personal service of notice, or within 90 days after the beginning of weekly publication of such notice of delinquency in the newspaper published nearest the claim, results in the delinquent's interest in the claim becoming the property of the owner or coowners who have paid for the assessment work.

Extent of the Right to Locate Claims and Those Eligible to Make Locations.

Neither the United States nor California mining laws limit the number of lode claims that may be located by one person. An individual may locate as many claims for lode mining as he is able to find separate valid discoveries of mineral for, the law requiring that such a discovery be made for each claim within the boundaries of the claim.

A single locator may not locate more than 20 acres of placer mining ground in one 'claim,' but an association of locators may take up an association placer, containing not more than 20 acres for each locator, and not more than 160 acres in a single such association 'claim' by a minimum of eight persons.

Women and minor children have equal rights with others in locating mining claims.

What May Be Located as Mineral.

It seems strange that dispute should arise as to whether or not a substance is mineral. Yet it is of recent record that the question of the mineral character has been raised in the case of such an important mineral as petroleum, by parties who were interested in having oil lands declared nonmineral. Besides the metals, which are minerals beyond dispute, the following substances have been held to be mineral, according to the decision of the United States Land Office and the

courts: Alum, amber, asphaltum (see petroleum), borax, brick clay, building stone, carbonates (of soda etc.) cement (gypsum), china clay, high-grade pottery clay, etc.; coal (special laws govern), diamonds and other precious stones, gravel, guano, gypsum, kaolin, limestone, marble, mica, natural gas (see petroleum), nitrates, onyx, petroleum (special withdrawals), potash (special legislation), phosphates (special legislation), salt (special law), sand, sandstone, slate, soda (nitrate and carbonate), stone of special commercial value, sulphur and amber.

There is sometimes question as to whether or not a certain deposit should be located as placer or lode. In such a case and in the absence of sufficient technical knowledge or lack of advice, there is nothing to prevent the location both as lode and placer, pending final determination of the character of deposit. In locating placer mining ground in which lodes occur, special attention should be paid to the provisions of law governing such cases. The Revised Statutes of the United States, title 32, chapter 6, section 2333, cover this point. It is provided that lodes known to exist within a placer claim for which patent is being sought must be described and separately purchased, and if the placer claimant, knowing of the presence of such lodes, fails to mention them in his application for placer patent, his failure to so do shall be construed as a declaration that he has no right of possession of such lodes. Quartz claims with a width of fifty feet may be taken up on *known* quartz veins within the boundaries of placer claims, but the complications that are apt to arise when a second party attempts to make such a location against the wishes of a hostile placer claimant, on whose claim he must trespass to make the lode location, are such as to call for the exercise of care. When a lode exists in a placer claim, but has not been discovered previous to the issuance of placer patent, the placer patent includes the lode or lodes that may be later discovered.

LANDS OPEN TO LOCATION FOR MINING.

Title 32, chapter 6, section 2319, Revised Statutes of the United States, provides that all valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States, and those who have declared their intention to become such. During recent years there have been many withdrawals of mineral lands and much special legislation regarding deposits of certain minerals. In fact there has been such a tendency ever since 1866, when a bill was presented in congress providing for the leasing of western mining lands on royalty. This was defeated by the western mining interests who substituted the mining law of 1866, which was later superseded by the enactment of 1872.

Under present conditions, lands known to contain coal, petroleum, oil shale, potash, phosphate, sodium salts (except common salt, on which one claim only can be located) can not be located and patented under the regular lode or placer laws but are obtainable under lease, subject to the control of the Secretary of the Interior. Land in certain national parks and national monuments is also not subject to entry. There have also been certain withdrawals of public lands for powersite

and kindred use, with a Federal Power Commission exercising certain powers of disposal, and with entries for other purposes not allowed. The status of these powersite withdrawals, as affecting the miner's rights, is somewhat uncertain, and whether or not he could successfully prosecute a claim to land taken up under the mining law within such power reserves is debatable, as the United States Land Office regulations seem to imply some leeway, depending on circumstances in each case. Certain Indian reservations in the western states, including a few in California, which have heretofore not been open to exploration for mining, have been thrown open for prospecting in the last few years, and rules and regulations have been set up under which such reservation lands may be mined. These rules are rather onerous, and would deter the ordinary small prospector. Among the requirements for working such lands is one calling for a bond to be executed in favor of the government for \$500 or more on each lease, depending on acreage, and the payment of annual rental of 25 cents and upward per acre, as well as payment of royalty on any ores or minerals sold. This reservation land can be mined only for metalliferous minerals. Claims are to be taken up according to the United States mining laws, and annual assessment work has to be done in addition to having a survey made and fulfilling all the other terms mentioned. Information regarding mining such Indian reservation lands can be had from the several superintendents of the reservations. The leases are issued by the Secretary of the Interior, through the local superintendents.

Vacant government land within the numerous national forests of this state is open to location and patent for mining purposes to the same extent as other vacant unreserved government land. The total area of the national forests in California is about 19,000,000 acres and the lands included lie for the most part in the mountainous eastern part of the state, away from the settled portions and in general above an elevation of 2500 feet. Maps of the different forests may be obtained from the various local offices of the United States Forest Service or from their office in the Ferry Building, San Francisco. There is, of course, a great deal of patented land within the boundaries of these forests, which was patented before the forest reserve was set aside, and the local forest service employes should be consulted about such lands if in doubt.

The speed with which the unreserved government lands (outside the national forests) in this state are being patented or otherwise withdrawn is shown by a comparison. On July 1, 1919, the General Land Office reported that the total acreage of such lands in California was 20,239,977 acres. On July 1, 1923, the total acreage was 18,091,187 acres, showing that over ten per cent of such lands had been patented or withdrawn in the four years concerned. The figures are from circulars of the General Land Office. The United States government maintains local land offices at the following points in this state, where information can be had regarding vacant government lands or steps taken to make entry for patent: El Centro, Eureka, Independence, Los Angeles, Sacramento, San Francisco, Susanville, and Visalia.

Mention should also be made here of the land included in stock-raising homesteads, patented under the act of December 29, 1916. Under the provisions of this act the Secretary of the Interior was

authorized to designate unreserved public lands in the public-land states, of which California is one, as stock-raising lands. This does not refer to lands within the national forests. Under the terms of section 9 of this act, it is provided that all patents issued thereunder "shall contain a reservation to the United States of all coal and other minerals in the lands so entered and patented, together with the right to prospect for, mine and remove the same"; the same section also provides that any person qualified to locate and enter the coal or other mineral deposits, or having the right to mine and remove the same under the laws of the United States, shall have the right at all times to enter upon the lands entered or patented under the act for the purpose of prospecting for the coal or other mineral therein. But he shall not injure or damage or destroy the permanent improvements of the entryman or patentee and shall be liable to and shall compensate the entryman or patentee for all damages to the crops on the land by reason of such prospecting. The prospector is required to do one of three things: (1) he must obtain the written consent or waiver of the homestead entryman or patentee; (2) he must pay damages to crops or other tangible improvements if and when an agreement is reached as to the amount of such damages; or, (3) in lieu of either of the foregoing provisions, he must execute a good and sufficient bond for not less than \$1,000 in favor of the United States for the use and benefit of the homesteader, to secure the payment of such damages. Subject to these provisions, he may occupy as much of the surface of such a homestead as may be reasonably necessary for the mining and removal of the mineral deposits within his mining claims. Where the mining location was made prior to the entry for homestead, the mining claimant must exercise diligence in filing a protest in the local land office of the district in which his claim is, setting forth the facts regarding his mining claim and the mineral character of the land, otherwise he is apt to awake too late to the fact that his claim has been given to the homesteader.

This act has been the cause of considerable complaint, and appears in some particulars to contradict itself. While it expressly reserves the mineral resources in such lands and affirms the right of qualified persons to enter the land for the purpose of prospecting for and mining mineral deposits, it also sets up restrictions which tend to discourage the prospector and which are discriminatory in favor of the homesteader.

Before passing from the subject of vacant public lands and the rights of the prospector thereon, it can not be too forcibly emphasized that, having once located a mining claim with the intention of holding and working the same, the only safe course for the locator to follow is to complete in the shortest possible time the \$500 worth of labor or improvements required for patent, to have the necessary survey made, and to press his application for patent with all diligence. Under the present laws, the miner has no means of making his claim known officially to the United States Land Office until he has completed the above work and has sought a patent, or until adverse claimants make it necessary for him to file a protest. If he spends only part of the year in the district where his claims are, it may happen that the published notice of application for patent by adverse

claimants may escape his attention, and patent may be given to the adverse claimant for the land within his mining location, in spite of the fact that he may have fulfilled all the requirements of law to hold his claim and may be actually developing the claim at the time. This state of affairs is possible because of the failure of the United States Land Office to examine the character of lands for which patent is sought unless a protest is made.

STATE LANDS OPEN TO MINING.

Besides the vacant government lands, there are within the State of California about 750,000 acres of land belonging to the state. This consists chiefly of sections numbered 16 and 36, thus far unsold, in each township, except where exchanges have been made or are in course of being made, with the federal government for administrative reasons. Much of this land, like the vacant government lands, is either mountainous or desert land having little value as a rule for agriculture but with mineral possibilities in many cases. The counties containing large acreages of this state land are as follows: San Bernardino, about 250,000 acres; Inyo, about 150,000 acres; Riverside, 50,000 acres; Lassen, about 60,000 acres; Modoc, about 30,000 acres; Imperial, 30,000 acres, with lesser amounts in other counties, there being some of this land in about forty counties. This land is sold subject to a reservation of one-sixteenth of all minerals ever found therein to the state. Unsold state lands may be prospected, and may be leased for mining purposes, under regulations prescribed by the State Surveyor General, Capitol Building, Sacramento, and requests for information regarding the location of such lands and regulations governing the sale or lease of same should be addressed to him.

The records and reports of the State Mining Bureau, as well as the various government reports on file in the offices of the Bureau, may be referred to for information about the geology and mineral resources of the entire state, and these records will often be found useful in giving the prospector a general idea of the character and mineral possibilities of the district where he intends to search for minerals.

OTHER LAWS AFFECTING THE MINING LOCATOR.

Hydraulic Mining.

Placer mining by the hydraulic process on streams which drain into any tributary of a navigable river in this state must be carried on under regulations laid down by the California Debris Commission, made up of three officers of the Corps of Engineers, United States Army. For information regarding steps to be taken in order to obtain written permission for hydraulic mining on the watersheds of the navigable rivers, inquiries should be addressed to Major U. S. Grant III, secretary, California Debris Commission, 85 Second street, San Francisco. The above restrictions do not apply on the Trinity, Klamath, Salmon, Smith or other rivers of the northern part of the state which are not navigable, but do cover work on any tributary of the Sacramento or San Joaquin or Feather rivers, which means all that part of the state whose streams flow into the great central valley.

Safety Regulations.

The Industrial Accident Commission of California is charged with the framing and enforcement of safety orders and rules for the protection of mine workers, and inquiries on any phase of this subject should be addressed to the commission at the State Building, Civic Center, San Francisco.

Use of Water for Mining.

The miner often wishes to use water that flows through or near by his claims. While the riparian right will permit the use by such an owner of water flowing through the claim where it is used, it is necessary to file an appropriation when desiring to make use of water where the diversion point is outside of the claim. For the formalities to be observed in making an appropriation, the inquirer should address State Water Commission, Department of Public Works, Forum Building, Sacramento. Water must be put to beneficial use as soon as possible, to hold it.

Use of Timber on Unpatented Mining Claims.

The law permits a locator to use for mining or other necessities *on the claim or claims concerned*, any timber growing thereon, but such timber can not be cut down and taken off the claim for other uses.

Use of Mining Claims for Other Purposes.

A mining claim can not be located as such and then used for other purposes such as a site for a store or summer resort, and such an attempted use would invalidate the location.

UNITED STATES MINING STATUTES.

Title XXXII, Chapter 6. Revised Statutes.

SEC. 2319. All valuable mineral deposits in lands belonging to the United States, both surveyed and unsurveyed, are hereby declared to be free and open to exploration and purchase, and the lands in which they are found to occupation and purchase, by citizens of the United States and those who have declared their intention to become such, under regulations prescribed by law, and according to the local customs or rules of miners in the several mining districts, so far as the same are applicable and not inconsistent with the laws of the United States.

Lode Claims.

SEC. 2320. Mining claims upon veins or lodes of quartz or other rock in place bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposits, heretofore located, shall be governed as to length along the vein or lode by the customs, regulations, and laws in force at the date of their location. A mining claim located after the tenth day of May, eighteen hundred and seventy-two, whether located by one or more persons, may equal, but shall not exceed, one thousand five hundred feet in length along the vein or lode; but no location of a mining claim shall be made until the discovery of the vein or lode within the limits of the claim located. No claim shall extend more than three hundred feet on each side of the middle of the vein at the surface, nor shall any claim be limited by any mining regulation to less than twenty-five feet on each side of the middle of the vein at the surface, except where adverse rights existing on the tenth day of May, eighteen hundred and seventy-two, render such limitation necessary. The end lines of each claim shall be parallel to each other.

Citizenship.

SEC. 2321. Proof of citizenship, under this chapter, may consist, in the case of an individual, of his own affidavit thereof; in the case of an association of persons unincorporated, of the affidavit of their authorized agent, made on his own knowledge, or upon information and belief; and in the case of a corporation organized under the laws of the United States, or of any state or territory thereof, by the filing of a certified copy of their charter or certificate of incorporation.

This is supplemented by an act of April 26, 1882, which provides:

"That applicants for mineral patents, if residing beyond the limits of the district wherein the claim is situated, may make any oath or affidavit required for proof of citizenship before the clerk of any court of record, or before any notary public of any state or territory." (22 Stats. at Large, p. 49, Chap. 106.)

Extralateral Rights.

SEC. 2322. The locators of all mining locations heretofore made or which shall hereafter be made, on any mineral vein, lode, or ledge, situated on the public domain, their heirs and assigns, where no adverse claims exist on the tenth day of May, eighteen hundred and seventy-two, so long as they comply with the laws of the United States, and with state, territorial and local regulations not in conflict with the laws of the United States governing their possessory title, shall have the exclusive right of possession and enjoyment of all the surface included within the lines of their locations, and of all veins, lodes and ledges throughout their entire depth, the top or apex of which lies inside of such surface lines extended downward vertically, although such veins, lodes, or ledges may so far depart from a perpendicular in their course downward as to extend outside the vertical side lines of such surface locations. But their right of possession to such outside parts of such veins or ledges shall be confined to such portions thereof as lie between vertical planes drawn downward as above described through the end lines of their locations, so continued in their own direction that such planes will intersect such exterior parts of such veins or ledges. And nothing in this section shall authorize the locator or possessor of a vein, or lode which extends in its downward course beyond the vertical lines of his claim, to enter upon the surface of a claim owned or possessed by another.

Tunnel Claims.

SEC. 2323. Where a tunnel is run for the development of a vein or lode, or for the discovery of mines, the owners of such tunnel shall have the right of possession of all veins or lodes within three thousand feet from the face of such tunnel on the line thereof, not previously known to exist, discovered in such tunnel, to the same extent as if discovered from the surface and locations on the line of such tunnel of veins or lodes not appearing on the surface, made by other parties after the commencement of the tunnel, and while the same is being prosecuted with reasonable diligence, shall be invalid, but failure to prosecute the work on the tunnel for six months shall be considered as an abandonment of the right to all undiscovered veins on the line of such tunnel.

Recording and Annual Assessments.

SEC. 2324. The miners of each mining district may make regulations not in conflict with the laws of the United States, or with the laws of the state or territory in which the district is situated, governing the location, manner of recording, amount of work necessary to hold possession of a mining claim, subject to the following requirements: The location must be distinctly marked on the ground so that its boundaries can be readily traced. All records of mining claims hereafter made shall contain the name or names of the locators, the date of the location, and such a description of the claim or claims located by reference to some natural object or permanent monument as will identify the claim. On each claim located after the tenth day of May, eighteen hundred and seventy-two, and until a patent has been issued therefor, not less than one hundred dollars' worth of labor shall be performed or improvements made during each year.

Be it enacted by the senate and house of representatives of the United States of America in congress assembled, that section two thousand, three hundred and twenty-four of the Revised Statutes be, and the same is hereby, amended so that where a person or company has or may run a tunnel for the purpose of developing a lode or

lodes, owned by said person or company, the money so expended in said tunnel shall be taken and considered as expended on said lode or lodes, whether located prior to or since the passage of said act; and such person or company shall not be required to perform work on the surface of said lode or lodes in order to hold the same as required by said act. (18 Stats. at Large, page 315, Chap. 41.)

Patents.

Section 2325 of the federal statutes provides that after \$500 has been expended on a mining claim in work or improvements, a patent can be applied for, upon the claim being surveyed by a United States mineral surveyor, and by the payment of \$5 per acre for the land to the United States government.

PLACERS.

SEC. 2329. Claims usually called "placers" including all forms of deposit, excepting veins of quartz, or other rock in place, shall be subject to entry and patent, under like circumstances and conditions, and upon similar proceedings, as are provided for vein or lode claims; but where the lands have been previously surveyed by the United States, the entry in its exterior limits shall conform to the legal subdivisions of the public lands.

Areas of Placer Claims.

SEC. 2330. Legal subdivisions of forty acres may be subdivided into ten-acre tracts, and two or more persons, or associations of persons, having contiguous claims of any size, although such claims may be less than ten acres each, may make joint entry thereof; but no location of a placer claim, made after the ninth day of July, eighteen hundred and seventy, shall exceed one hundred and sixty acres for any one person or association of persons, which location shall conform to the United States surveys; and nothing in this section contained shall defeat or impair any bona fide preemption or homestead claim upon agricultural lands, or authorize the sale of the improvements of any bona fide settler to any purchaser.

SEC. 2331. Where placer claims are upon surveyed lands, and conform to legal subdivisions, no further survey or plat shall be required, and all placer mining claims located after the tenth day of May, eighteen hundred and seventy-two, shall conform as near as practicable with the United States system of public lands surveys, and the rectangular subdivisions of such surveys, and no such location shall include more than twenty acres for each individual claimant; but where placer claims can not be conformed to legal subdivisions, survey and plat shall be made as on unsurveyed lands; and where by the segregation of mineral land in any legal subdivision a quantity of agricultural land less than forty acres remains, such fractional portion of agricultural land may be entered by any party qualified by law, for homestead or preemption purposes.

Placer Boundaries.

SEC. 2333. Where the same person, association, or corporation is in possession of a placer claim, and also a vein or lode included within the boundaries thereof, application shall be made for a patent for the placer claim, with the statement that it includes such vein or lode, and in such case a patent shall issue for the placer claim, subject to the provisions of this chapter, including such vein or lode upon the payment of five dollars per acre for such vein or lode claim, and twenty-five feet of surface on each side thereof. The remainder of the placer claim, or any placer claim not embracing any vein or lode claim, shall be paid for at the rate of two dollars and fifty cents per acre, together with all costs of proceedings; and where a vein or lode, such as is described in section twenty-three hundred and twenty, is known to exist within the boundaries of a placer claim, an application for a patent for such placer claim which does not include an application for the vein or lode claim shall be construed as a conclusive declaration that the claimant of the placer claim has no right of possession of the vein or lode claim; but where the existence of a vein or lode in a placer claim is not known, a patent for the placer claim shall convey all valuable mineral and other deposits within the boundaries thereof.

CALIFORNIA STATUTES REGARDING LOCATION OF MINING CLAIMS, MILL SITES AND ASSESSMENT WORK.

An act to amend the Civil Code of California by adding a new title thereto, to be numbered title X, in part IV of division second, consisting of sections 1426,

1426a, 1426b, 1426c, 1426d, 1426e, 1426f, 1426g, 1426h, 1426i, 1426j, 1426k, 1426l, 1426m, 1426n, 1426o, 1426p, 1426q, 1426r, and 1426s, providing for the manner of locating lode and placer mining claims, tunnel rights, mill sites, and prescribing the character and amount of assessment work on mining claims, and providing for proofs of such work, and for the recordation of location notices, and proof of labor, and for the enforcement of contributions from delinquent co-owners of mining claims, and prescribing the duties of county recorders respecting the recording of location notices of, and proofs of labor on, mining claims, tunnel rights, and mill sites, and the fees to be charged therefor, and repealing acts in conflict herewith.

[Approved March 13, 1909.]

The people of the State of California, represented in senate and assembly, do enact as follows:

SECTION 1. The Civil Code of the State of California is hereby amended by adding a new title thereto, to be numbered title X, in part IV of second division, consisting of sections 1426, 1426a, 1426b, 1426c, 1426d, 1426e, 1426f, 1426g, 1426h, 1426i, 1426j, 1426k, 1426l, 1426m, 1426n, 1426o, 1426p, 1426q, 1426r, and 1426s, to read as follows:

§ 1426. Any person, a citizen of the United States, or who has declared his intention to become such, who discovers a vein or lode of quartz, or other rock in place bearing gold, silver, cinnabar, lead, tin, copper, or other valuable deposit, may locate a claim upon such vein or lode, by defining the boundaries of the claim, in the manner hereinafter described, and by posting a notice of such location, at the point of discovery, which notice must contain:

First—The name of the lode or claim.

Second—The name of the locator or locators.

Third—The number of linear feet claimed in length along the course of the vein, each way from the point of discovery, with the width on each side of the center of the claim, and the general course of the vein or lode, as near as may be.

Fourth—The date of location.

Fifth—Such a description of the claim by reference to some natural object, or permanent monument, as will identify the claim located.

§ 1426a. The locator must define the boundaries of his claim so that they may be readily traced, and in no case shall the claim extend more than fifteen hundred feet along the course of the vein or lode, nor more than three hundred feet on either side thereof, measured from the center line of the vein at the surface.

§ 1426b. Within thirty days after the posting of his notice of location upon a lode mining claim, the locator shall record a true copy thereof in the office of the county recorder of the county in which such claim is situated, for which service the county recorder shall receive a fee of one dollar.

§ 1426c. The location of a placer claim shall be made in the following manner: By posting thereon, upon a tree, rock in place, stone, post or monument, a notice of location, containing the name of the claim, name of locator or locators, date of location, number of feet or acreage claimed, such a description of the claim by reference to some natural object or permanent monument as will identify the claim located, and by marking the boundaries so that they may be readily traced; *provided*, that where the United States survey has been extended over the land embraced in the location, the claim may be taken by legal subdivisions and no other reference than those of said survey shall be required and the boundaries of a claim so located and described need not be staked or monumented. The description by legal subdivisions shall be deemed the equivalent of marking.

§ 1426d. Within thirty days after the posting of the notice of location of a placer claim, the locator shall record a true copy thereof in the office of the county recorder of the county in which such claim is situated, for which service the recorder shall receive a fee of one dollar.

§ 1426e. The locator of a tunnel right or location, shall locate his tunnel right or location by posting a notice of location at the face or point of commencement of the tunnel, which must contain:

First—The name of the locator or locators.

Second—The date of the location.

Third—The proposed course or direction of the tunnel.

Fourth—A description of the tunnel, with reference to some natural object or permanent monument as shall identify the claim or tunnel right.

§ 1426f. The boundary lines of the tunnel shall be established by stakes or

monuments placed along the lines at an interval of not more than six hundred feet from the face or point of commencement of the tunnel to the terminus of three thousand feet therefrom.

§ 1426*g*. Within thirty days after the posting the notice of location of the tunnel right or location, the locator shall record a true copy thereof, in the office of the county recorder of the county in which such claim is situated, for which service the recorder shall receive a fee of one dollar.

§ 1426*h*. If at any time the locator of any mining claim heretofore or hereafter located, or his assigns, shall apprehend that his original location notice was defective, erroneous, or that the requirements of the law had not been complied with before filing; or in case the original notice was made prior to the passage of this act, and he shall be desirous of securing the benefit of this act, such locator, or his assigns, may file an additional notice, subject to the provisions of this act; *provided*, that such amended location does not interfere with the existing rights of others at the time of posting and filing such amended location notice, and no such amended location notice or the record thereof, shall preclude the claimant, or claimants from proving any such title as he or they may have held under previous locations.

§ 1426*i*. Where a locator, or his assigns, has the boundaries and corners of his claim established by a United States deputy mineral survey, or a licensed surveyor of this state, and his claim connected with the corner of the public or minor surveys of an established initial point, and incorporates into the record of the claim, the field notes of such survey, and attaches to and files with such location notice a certificate of the surveyor, setting forth: *first*, that said survey was actually made by him, giving the date thereof; *second*, the name of the claim surveyed and the location thereof; *third*, that the description incorporated in the declaratory statement is sufficient to identify; such survey and certificate becomes a part of the record, and such record is prima facie evidence of the facts therein contained.

§ 1426*j*. The proprietor of a vein or lode claim or mine, or the owner of a quartz mill or reduction works, or any person qualified by the laws of the United States, may locate not more than five acres of non-mineral land as a mill site. Such location shall be made in the same manner as hereinbefore required for locating placer claims.

§ 1426*k*. The locator of a mill site claim or location shall, within thirty days from the date of his location, record a true copy of his location notice with the county recorder of the county in which such location is situated, for which service the recorder shall receive a fee of one dollar.

§ 1426*l*. The amount of work done or improvements made during each year to hold possession of a mining claim shall be that prescribed by the laws of the United States, to wit: One hundred dollars annually.

§ 1426*m*. Whenever [a] mine owner, company, or corporation shall have performed the labor and made the improvements required by law upon any mining claim, the person in whose behalf such labor was performed or improvements made, or some one in his behalf, shall within thirty days after the time limited for performing such labor or making such improvements make and have recorded by the county recorder, in books kept for that purpose, in the county in which such mining claim is situated, an affidavit setting forth the value of labor or improvements made, the name of the claim, and the name of the owner or claimant of said claim at whose expense the same was made or performed. Such affidavit, or a copy thereof, duly certified by the county recorder, shall be prima facie evidence of the performance of such labor or the making of such improvements, or both.

§ 1426*n*. For recording the affidavit herein required, the county recorder shall receive a fee of fifty cents.

§ 1426*o*. Whenever a co-owner or co-owners of a mining claim shall give to a delinquent co-owner or co-owners the notice in writing or notice by publication provided for in section 2324, Revised Statutes of the United States, an affidavit of the person giving such notice, stating the time, place, manner of service, and by whom and upon whom such service was made, shall be attached to a true copy of such notice, and such notice and affidavit must be recorded in the office of the county recorder, in books kept for that purpose, in the county in which the claim is situated, within ninety days, after the giving of such notice; for the recording of which said recorder shall receive the same fees as are now allowed by law for recording deeds; or if such notice is given by publication in a newspaper, there shall be attached to a printed copy of such notice an affidavit of the printer or his foreman, or principal clerk of such paper, stating the date of the first, last and each insertion of such notice therein, and where the newspaper was published during that time, and the name of such newspaper. Such affidavit and notice shall be recorded as aforesaid, within one hundred and eighty days after the first publication thereof. The original

of such notice and affidavit, or a duly certified copy of the record thereof, shall be prima facie evidence that the delinquent mentioned in section 2324 has failed or refused to contribute his proportion of the expenditure required by that section, and of the service of publication of said notice; *provided*, the writing or affidavit herein-after provided for is not of record. If such delinquent shall, within the ninety days required by section 2324, aforesaid, contributed to his co-owner or co-owners, his proportion of such expenditures, and also all costs of service of the notice required by this section, whether incurred for publication charges, or otherwise, such co-owner or co-owners shall sign and deliver to the delinquent or delinquents a writing stating that the delinquent or delinquents by name has within the time required by section 2324 aforesaid, contributed his share for the year -----, upon the ----- mine, and further stating therein the district, county and state wherein the same is situated, and the book and page where the location notice is recorded, if said mine was located under the provisions of this act; such writing shall be recorded in the office of the county recorder of said county, for which he shall receive the same fees as are now allowed by law for recording deeds. If such co-owner or co-owners shall fail to sign and deliver such writing to the delinquent or delinquents within twenty days after such contribution, the co-owner or co-owners so failing as aforesaid shall be liable to the penalty of one hundred dollars, to be recovered by any person for the use of the delinquent or delinquents in any court of competent jurisdiction. If such co-owner or co-owners fail to deliver such writing within said twenty days, the delinquent, with two disinterested persons having personal knowledge of such contribution, may make affidavit setting forth in what manner, the amount of, to whom, and upon what mine, such contribution was made. Such affidavit, or a record thereof, in the office of the county recorder of the county in which such mine is situated, shall be prima facie evidence of such contribution.

§ 1426p. The record of any location of a mining claim, mill site or tunnel right, in the office of the county recorder, as herein provided shall be received in evidence, and have the same force and effect in the courts of the state as the original notice.

§ 1426q. Copies of the records of all instruments required to be recorded by the provisions of this act, duly certified by the recorder, in whose custody such records are, may be read in evidence, under the same circumstances and rules as are now, or may be hereafter provided by law, for using copies of instruments relating to real estate, duly executed or acknowledged or proved and recorded.

§ 1426r. The provisions of this act shall not in any manner be construed as affecting or abolishing any mining district or the rules and regulations thereof within the State of California.

§ 1426s. The failure or neglect of any locator of a mining claim to perform development work of the character, in the manner and within the time required by the laws of the United States, shall disqualify such locators from relocating the ground embraced in the original location or mining claim or any part thereof under the mining laws, within three years after the date of his original location and any attempted relocation thereof by any of the original locators shall render such location void.

SEC. 2. All acts and parts of acts in conflict with this act, are hereby repealed.

SEC. 3. This act shall take effect and be in force on and after July 1, 1909.

FORMS FOR LOCATION NOTICES.

The following forms for mineral location notices have been found to fill the requirements of the statutes, in California:

NOTICE OF QUARTZ LODE LOCATION.

Notice is hereby given, That I, -----, have discovered a vein of rock in place, carrying valuable deposits, upon which I have erected a discovery monument and posted this notice, as hereinafter set forth: that in accordance with the provision of chapter VI, title XXXII of the Revised Statutes of the United States and the laws of the State of California, I hereby claim fifteen hundred linear feet of said vein, measured thereon as hereinafter set forth. Said discovery was made on the ----- day of -----, 19----. Immediately upon making the same, and on the ----- day of -----, 19----, I erected at the point of discovery, a substantial monument, consisting of a mound of rocks and ----- and posted thereon this notice.

The *general course of said vein is ----- and ----- I claim in length thereon ----- feet ----- and ----- feet ----- from

*Make this description in accordance with the facts, as "The general course of said vein is north and south. I claim in length thereon (for example) 500 feet north

said discovery monument. I also claim three hundred feet on each side of the center of the vein. This vein or claim shall be known as and called the _____

It is situated in _____ Mining District, and in §Sec. _____, Tp. _____, R. _____, B. and M., in _____ County, California, and the discovery monument _____ being placed about § _____

from _____

That the following is a description of said location as marked upon the ground: § commencing at the _____ of said claim, a _____ from which initial point the discovery monument is distant about _____ feet in a _____ direction; thence || _____

Dated, this _____ day of _____, 19 _____

Locator.

NOTICE OF LOCATION OF PLACER CLAIM.

Notice is hereby given, That _____ citizen _____ of the United States, h. _____ this _____ day of _____, 19 _____, discovered a valuable placer deposit within the limits of this claim; that by virtue of said discovery, _____ ha _____ located, and hereby locate and claim the following described land, situate in _____ Mining District, _____ County, California, to wit: * _____ of section _____ township _____, range _____, B. and M., containing _____ acres.† Said claim is hereby named _____ Placer Claim. Said claim is marked upon the ground as follows: § _____

This notice is posted on a mound of rocks at the point of discovery, situated § _____

Dated and posted on the ground, this _____ day of _____, 19 _____

Locator.

and 1000 feet south from said discovery monument."

¶If the claim is upon surveyed land, give the section, township and range, if possible. This is not required by law, but makes a much better description.

§Here refer to some natural object or permanent monument so as to identify the locality of the claim, in compliance with section 2324, Revised Statutes U. S. A road, house, tree, known mountain or peak, government corner, mill, or known mining claim, are such objects or monuments. As, "About one mile directly east from John Doe's quartz mill and 400 rods west from the Last Hope mine," etc.

†Here state (for example): "Commencing at the N.E. corner of said claim, a mound of rocks 4 ft. high," or at any other corner or point in the boundary; give the distance and direction from this initial monument to the discovery monument, and then locate the discovery with reference to some natural object or permanent monument.

¶Here follows a description of the claim from the initial monument. For instance: "Thence 600 ft. northwesterly to the N.W. corner of said claim, at which point is a mound of rocks 2½ ft. high, marked so-and-so (if marked); thence 1500 ft. southwesterly to the S.W. corner of said claim, being a mound of rocks," etc.; so going around the claim to the point of beginning.

*The statute provides that the locator must give "a description of the claim by reference to legal subdivisions of sections, if the location is made in conformity with the public surveys; otherwise a description with reference to some natural object or permanent monument as will identify the claim."

¶When not described by legal subdivisions, the description should conform to that contained in the final certificate of location of a lode claim.

‡The statute provides that, whether described by legal subdivisions or not, the location shall be marked by the locator on the ground, and as the affidavit to be filed later is not required to contain a description of the claim, we think this notice should state how the location is marked; as, for instance, "At the N.E. corner of said tract a mound of rocks 3 ft. high, marked so-and-so (if marked), and at the N.W. corner a stake in a mound of rocks, marked," etc., and so on for each monument enclosing the claim.

§Here state where the discovery is located, as, for instance, "20 feet S.W. of the N.E. corner monument."

NOTE: A duplicate of either of these notices must be filed for record with the county recorder within 30 days from the discovery; and the locator is allowed 30 days to mark his location on the ground.

The foregoing form of placer notice may be used for location of all deposits which are classed under placer laws and not excepted by The Leasing Act of February 25, 1920 (see Oil and Gas Rights, pp. 212-215, 218-285, ante).

LICENSE REQUIRED TO HANDLE MINING PROPERTY.

BY EDWIN T. KEISER.¹

[The question as to whether or not a person handling mining property is required by the law to take out a real estate broker license has been raised many times. In order that those interested in the development of mines and mining in this state may have definite information on this subject, at the request of the State Mineralogist, the following notes have been prepared by Mr. Edwin T. Keiser, Commissioner, State Real Estate Department.]

As to whether or not a person selling mining property is required by the law to secure a real estate broker license, I first call your attention to section 1, chapter 605, Statutes 1919, which reads as follows: "It shall be unlawful for any person, copartnership or corporation to engage in the business, or act in the capacity of a real estate broker, or a real estate salesman within this state without first obtaining a license therefor."

Section 2, of the same chapter, reads as follows: "A real estate broker within the meaning of this act is a person, copartnership or corporation who, for a compensation, sells, or offers for sale, buys, or offers to buy, or negotiates the purchase or sale or exchange of real estate, or who, for compensation, negotiates loans on real estate, leases, or offers to lease, rents, or places for rent, or collects rents from real estate, or improvements thereon, for others as a whole or partial vocation."

The last sentence of the same section states that "One act, for a compensation, or buying or selling real estate of or for another, or offering for another to buy or sell or exchange real estate, or negotiating a loan on or leasing or renting or placing for rent real estate, or collecting rent therefrom shall constitute the person, copartnership or corporation making such offer, sale or purchase, exchange or lease, or negotiating said loan, or so renting or placing for rent or collecting said rent a real estate broker or salesman within the meaning of this act."

It can be readily seen from the above that any one who, for a compensation, buys or sells real estate for another is required to hold a real estate broker license, and that one act alone for a compensation constitutes such person a real estate broker or salesman.

I further call your attention to section 17, of the same act, which reads: "Any person or corporation acting as real estate broker or real estate salesman within the meaning of this act without a license as herein provided shall, upon conviction thereof, if a person, be punished by a fine of not to exceed two thousand dollars, or by imprisonment in the county jail or state prison for a term not to exceed two years, or by both such fine and imprisonment, in the discretion of the court; or if a corporation, be punished by a fine of not to exceed five thousand dollars."

Under section 20 of the act, "No person, copartnership or corporation engaged in the business or acting in the capacity of a real estate broker or a real estate salesman within this state shall bring or maintain any action in the courts of this state for the collection of compensation for the performance of any of the acts mentioned in section two hereof without alleging and proving that such person, copartner-

¹Commissioner, State Real Estate Department, Sacramento, Cal.

ship or corporation was a duly licensed real estate broker or real estate salesman at the time the alleged cause of action arose."

A broker, therefore, in order to collect for his services must be in the possession of a real estate broker license at the time the alleged cause of action arose. Many brokers have been defeated in their attempt to collect a commission because they were negligent and dilatory in the securing of a license from this department.

In regard to the application of the real estate act to mining property, I first call your attention to section 658, Civil Code of California, which defines real property, or immovable property, as:

1. Land;
2. That which is affixed to land;
3. That which is incidental or appurtenant to land;
4. That which is immovable by law.

Also, I call your attention to section 659 reading: "Land is the solid material of the earth, whatever may be the ingredients of which it is composed, whether soil, rock or other substance."

From the reading of this section it seems to me that a mine is real property.

Section 661, headed "Fixtures attached to mines," reads as follows: "Sluiceways, flumes, hose, pipes, railway tracks, cars, blacksmith-shops, mills, and all other machinery or tools used in working or developing a mine, are to be deemed affixed to the mine."

Section 662, under the head "Appurtenances," reads as follows: "A thing is deemed to be incidental or appurtenant to land when it is by right used with the land for its benefit, as in the case of a way, or watercourse, or of a passage for light, air, or heat from or across the land of another."

Taking into consideration the reading of the sections above referred to, my opinion is that mining property, all fixtures attached to mines, and all appurtenances thereto, are real estate. Therefore, any one selling or offering such property for sale for another for a compensation would be considered as a real estate broker or salesman within the meaning of the act. Therefore, such person should secure for himself, either a broker or a salesman license. One transaction is sufficient to constitute such person a real estate broker or salesman and should such person not have secured for himself a license at the time of negotiating and closing such transaction, he would be in violation of the law and liable to prosecution.

Further, should his right to a commission be disputed, he would not be able to bring or maintain an action in the civil courts of this state.

ADMINISTRATIVE DIVISION.

WALTER W. BRADLEY, Deputy State Mineralogist.

Personnel.

During the period, April 15–July 15, the following changes in personnel have taken place:

Mr. Forrest L. Campbell, librarian, has been transferred to the oil division as an inspector, with station at Los Angeles.

Mr. E. A. Lowe of San Francisco is temporarily filling the place of librarian.

IN THE OIL DIVISION:

Mr. R. M. Barnes, for nearly four years deputy supervisor at Coalinga, resigned to engage in commercial practice.

Mr. W. W. Copp, for the past year deputy supervisor at Taft, resigned to engage in commercial practice.

Mr. V. H. Wilhelm has been appointed Deputy Supervisor for District No. 5 with headquarters at Coalinga, to fill the position made vacant by the resignation of R. M. Barnes.

Mr. E. Huguenin, deputy supervisor, has been transferred from Santa Paula and is now in charge as Deputy Supervisor for District No. 4, with headquarters at Taft, to fill the position made vacant by the resignation of W. W. Copp.

Mr. H. A. Godde, formerly petroleum engineer in the Department of Petroleum and Gas, has been appointed Deputy Supervisor for District No. 2, with headquarters at Santa Paula, to succeed Deputy Supervisor E. Huguenin, transferred to District No. 4.

New Publications.

During the quarterly period covered by this issue, the following Bureau publications have been made available for distribution:

Bulletin No. 92, "Gold Placers of California," by Charles S. Haley. Accompanied by a topographic map in four colors showing distribution of the gravels. Price \$1.50, postpaid. Extra copies of the map are available, separately, at 50 cents apiece, postpaid.

Mining in California (quarterly), April 1924, being Chapter No. 2, of State Mineralogist's Report XX, price 25 cents.

Summary of Operations, California Oil Fields: Vol. 9, Nos. 8, 9, and 10, February, March and April, 1924, respectively.

Commercial Mineral Notes: Nos. 13, 14, 15, April-June, inc. These 'notes' carry the lists of 'mineral deposits wanted' and 'minerals for sale,' issued in the form of a mimeographed sheet, monthly. It is mailed free of charge to those on the mailing list for 'Mining in California.'

DIVISION OF MINERALS AND STATISTICS.

Statistics, Museum, Laboratory.

WALTER W. BRADLEY, Deputy State Mineralogist.

STATISTICS.

Figures on the 1923 production of several of California's commercial minerals were given in the April issue of 'Mining in California,' and data on a number of additional ones are here shown in advance of the publication of the complete and detailed bulletin in course of compilation at this writing (July 15).

COAL.

Coal production in California in 1923 totaled only 1010 tons valued at \$5.090, being credited to Mendocino and Riverside counties. None of it was marketed, but it was consumed for local camp purposes and for power and forge use in development work on the deposits. Besides the localities mentioned above, development work was also under way on coal deposits in San Benito and Shasta counties. In the former, at the property of the San Benito Coal Company, it is proposed to install an electric-power generating and by-product plant, rather than to ship the coal, owing to the distance from rail transportation.

Total Coal Production of California.

The very considerable output of coal in the years previous to 1883 was almost entirely from the Mount Diablo district, Contra Costa County. Later, the Tesla Mine in Corral Hollow, Alameda County, was an important producer for a few years. Stone Canyon, Monterey County, was also an important producer for a short time, and there has been some coal shipped from properties in Amador, Fresno, Orange, Riverside, and Siskiyou counties. The following tabulation gives the annual tonnages and values, according to available records:

Coal Output and Value by Years.

| Year | Tons | Value | Year | Tons | Value |
|------|---------|-----------|--------|-----------|--------------|
| 1861 | 6,620 | \$38,065 | 1893 | 72,603 | \$167,555 |
| 1862 | 23,400 | 134,550 | 1894 | 59,887 | 139,862 |
| 1863 | 43,200 | 248,400 | 1895 | 79,858 | 193,790 |

| 1889 | 121,280 | 288,232 | 1921 | 12,467 | 63,578 |
| 1890 | 110,711 | 283,019 | 1922 | 27,020 | 135,100 |
| 1891 | 93,301 | 204,902 | 1923 | 1,010 | 5,090 |
| 1892 | 85,178 | 209,711 | | | |
| | | | Totals | 5,205,155 | \$23,085,678 |

The tonnages in the above table for the years 1861-1886 (incl.) are taken from the U. S. Geological Survey, "Mineral Resources of the U. S., 1910," p. 107. The values assigned for the years previous to 1883 are those given by W. A. Goodyear (Mineral Res., 1882, pp. 93-94), being an average of \$5.75 per ton. From 1887 to date the figures are those of the California State Mining Bureau.

DOLOMITE.

The production of dolomite for the year 1923 totaled 69,519 tons valued at \$142,615, being an increase over the 52,409 tons and \$114,911 of 1922, and came from a total of six quarries in Inyo, Monterey, and San Benito counties.

An important part of the tonnage being shipped is utilized as a refractory lining in the bottoms of open-hearth steel furnaces, as a substitute for magnesite. Part of the Inyo County material is used for its CO₂ by the chemical plants on Owens Lake, in the manufacture of soda ash and bicarbonate from the waters of the lake. Some also is used for terrazzo and for stucco dash-coat.

The 1923 output was distributed as follows :

| County | Tons | Value |
|--------------------------|--------|-----------|
| Inyo | 47,542 | \$79,793 |
| Monterey and San Benito* | 21,977 | 62,822 |
| Totals | 69,519 | \$142,615 |

*Combined to conceal output of a single quarry in each.

Dolomite Production of California, by Years.

Amount and value of the output of dolomite, annually, have been as follows:

| Year | Tons | Value |
|-------------|---------|-----------|
| 1915..... | 4,192 | \$14,504 |
| 1916..... | 13,313 | 46,566 |
| 1917..... | 27,911 | 66,416 |
| 1918..... | 24,560 | 79,441 |
| 1919..... | 24,502 | 67,953 |
| 1920..... | 42,388 | 132,791 |
| 1921..... | 31,195 | 99,155 |
| 1922..... | 52,409 | 114,911 |
| 1923..... | 69,519 | 142,615 |
| Totals..... | 289,989 | \$764,352 |

FELDSPAR.

Feldspar was produced by five operators in two counties (Riverside and San Diego) during 1923, to the amount of 11,100 tons, valued at \$81,800, being more than double both the quantity and value of 1922 which were 4587 tons and \$37,109.

The product was used in the ceramic industry, principally in pottery, porcelain, enamel wares, also enamel brick and tile, being a constituent of both the body and the glaze, but more especially the latter. For the characteristics, grades, and marketing data of feldspar, the reader is referred to the excellent paper by Prof. Watts¹ and quoted in our report of last year.²

Total Feldspar Production of California.

Total amount and value of feldspar production in California since the inception of the industry are given in the following table, by years:

| Year | Tons | Value | Year | Tons | Value |
|-----------|-------|---------|-------------|--------|-----------|
| 1910..... | 760 | \$5,720 | 1917..... | 11,792 | \$46,411 |
| 1911..... | 740 | 4,560 | 1918..... | 4,132 | 22,061 |
| 1912..... | 1,382 | 6,180 | 1919..... | 1,272 | 12,965 |
| 1913..... | 2,129 | 7,850 | 1920..... | 4,518 | 26,189 |

| 1915..... | 1,800 | 9,000 | 1922..... | 4,587 | 37,109 |
| 1916..... | 2,630 | 14,350 | 1923..... | 11,100 | 81,800 |
| | | | Totals..... | 54,721 | \$318,098 |

FULLER'S EARTH.

Fuller's earth includes many kinds of unctious clays. It is usually soft, friable, earthy, nonplastic, white and gray to dark green in color, and some varieties disintegrate in water. In California, fuller's earth has been used in clarifying both refined mineral and vegetable oils, and for special chemical purposes; although its original use was in

¹Watts, A. S. The marketing of feldspar: Eng. & Min. Jour.-Press, Vol. 115, pp. 535-538, Mar. 24, 1923.

²Bradley, W. W. California mineral production for 1922: Cal. State Min. Bur., Bulletin 93, pp. 108-110, 1923.

fulling wool, as the name indicates. Production has come mainly from Calaveras and Solano counties, with other deposits noted also in Riverside, Fresno, Inyo, and Kern counties.

Clays of the montmorillonite and halloysite group ('rock soap') are being utilized by some of the oil refineries in lieu of true fuller's earth in the refining of petroleum products.

The production of 3650 tons, valued at \$55,125, here credited to 1923, as 'fuller's earth' is in reality colloidal clay of the montmorillonite class (sold under such local names as: 'bentonite,' 'otaylite,' 'shoshonite,' derived from the locality where found). Because of its being used for clarifying and filtering processes, we have placed it, for the purposes of this statistical report, under the 'fuller's earth' heading. After all, the practical test of a fuller's earth is not so much a chemical one, as a practical one: that is, its physical capacity to absorb basic colors and to remove these colors from solution in animal, vegetable or mineral oils, also from water.

The 1923 production in California shows a decrease in tonnage, but an increase in value and came from three properties, in Inyo and San Diego counties.

Fuller's Earth Production of California, by Years.

Fuller's earth was first produced commercially in this state in 1899, and the total amount and value of the output since that time are as follows:

| Year | Tons | Value | Year | Tons | Value |
|-----------|-------|----------|-------------|--------|-----------|
| 1899..... | 620 | \$12,400 | 1912..... | 876 | \$6,500 |
| 1900..... | 500 | 3,750 | 1913..... | 460 | 3,700 |
| 1901..... | 1,000 | 19,500 | 1914..... | 760 | 5,928 |
| 1902..... | 987 | 19,246 | 1915..... | 692 | 4,002 |
| 1903..... | 250 | 4,750 | 1916..... | 110 | 550 |
| 1904..... | 500 | 9,500 | 1917..... | 220 | 2,180 |
| 1905..... | 1,344 | 38,000 | 1918..... | 37 | 333 |
| 1906..... | 440 | 10,500 | 1919..... | 385 | 3,810 |
| 1907..... | 100 | 1,000 | 1920..... | 600 | 6,000 |
| 1908..... | 50 | 1,000 | 1921..... | 1,185 | 8,295 |
| 1909..... | 459 | 7,385 | 1922..... | 6,606 | 48,756 |
| 1910..... | 340 | 3,820 | 1923..... | 3,650 | 55,125 |
| 1911..... | 466 | 5,294 | Totals..... | 22,637 | \$281,324 |

NOTE.—Above production, in 1922–1923, was montmorillonite (hydrous aluminum silicate) a colloidal clay, sometimes called 'rock soap,' and in part locally called 'shoshonite' from its being found near Shoshone in Inyo County; and in part 'otaylite' from Otay, San Diego County.

GEMS.

The production of gem materials in California has been somewhat irregular and uncertain since 1911. The compilation of complete statistics is difficult owing to the widely scattered places at which stones are gathered and marketed in a small way. The materials reported in 1923 totaled \$13,220 in value, the increase over the figure of \$1,312 in 1922 being due mainly to a slight renewal of activity in the tourmaline district of northern San Diego County, and in part to shipments of quartz crystals from Calaveras County.

The following table shows the distribution of rough, uncut gem and jeweler's materials during 1923:

| County | Value | Kind |
|---------------------|----------|---|
| San Diego..... | \$8,530 | Tourmaline, kunzite, essonite and spessartite garnets, aqua-marine and pink beryl, blue topaz, quartz crystals. |
| Butte..... | *4,690 | {Diamonds. |
| Calaveras..... | | {Quartz crystals. |
| Inyo..... | | {Turgite, opals, chalcedony, lapis lazuli. |
| Riverside..... | | {Quartz crystals, green beryl. |
| San Bernardino..... | | {Topaz, thomsonite. |
| Total value..... | \$13,220 | |

*Combined to conceal output of a single operator in each.

For a detailed listing of the industrial uses of precious and semi-precious stones, the reader is referred to our statistical report for 1922.¹

Total Production of Gem Materials in California.

The value of the gem output in California annually since the beginning of commercial production is as follows:

| Year | Value | Year | Value |
|-----------|----------|------------|-------------|
| 1900..... | \$20,500 | 1912..... | \$23,050 |
| 1901..... | 40,000 | 1913..... | 13,740 |
| 1902..... | 162,100 | 1914..... | 3,970 |
| 1903..... | 110,500 | 1915..... | 3,565 |
| 1904..... | 136,000 | 1916..... | 4,752 |
| 1905..... | 148,500 | 1917..... | 3,049 |
| 1906..... | 497,090 | 1918..... | 650 |
| 1907..... | 232,642 | 1919..... | 5,425 |
| 1908..... | 208,950 | 1920..... | 36,056 |
| 1909..... | 193,700 | 1921..... | 10,954 |
| 1910..... | 237,475 | 1922..... | 1,312 |
| 1911..... | 51,824 | 1923..... | 13,220 |
| | | Total..... | \$2,159,024 |

GOLD.

Gold was the first and, for many years, the most important single mineral product of California. Although now surpassed for a number of years in annual value by petroleum, and by cement beginning with 1920, it still heads our metal list, and California continues to outrank all the other gold-producing states of the United States, including Alaska. In fact, at present California is producing approximately one-third of the gold mined in the entire United States.

While there is some renewal of activity in the development of gold lode properties, it has not yet become reflected in an increased yield of the metal. The 1923 figures show a decrease from the 1922 yield. The continued shut-down of most of the copper mines which have always been important producers of by-product gold and silver, has also been an important factor.

¹California mineral production for 1922: Cal. State Min. Bur., Bulletin 93, pp. 115-117, 1923.

Outlook for 1924.

According to the mid-year review of the United States Geological Survey¹ for the first six months of 1924,

"Metal mining in California was rather active during the first six months of 1924, * * * as shown by reports received from the miners by J. M. Hill, of the San Francisco office of the Geological Survey. Most of the activity has been directed to the development of gold quartz mines rather than to production, for the output of gold and silver was less than in the first six months of 1923. Five of the large Mother Lode mines—the Argonaut, Plymouth, Shawmut, Central Eureka, and Moore—are deepening their shafts. The placer output was small, because of drought; a large number of hydraulic properties in the Klamath and Sierra mountains had almost no water and therefore made but small output. The dredges maintained production at about the normal rate, but fewer boats are working. The silver mines, particularly the California Rand, curtailed production in order to carry on extensive development. The lead producers in the southern part of the state have apparently been working at the normal rate. The production of copper has been further increased; the rate during the first six months of 1924 was about 4,000,000 pounds a month. The work of development at the Engels mine may restrict the output there during the rest of the year."

Elephant Deep Hydraulic Mine, at Volcano, Amador County, Cal.

Production in 1923.

The State Mining Bureau has never independently collected statistics of gold and silver production, as there is no necessity for duplicating the very thoroughly organized work of the U. S. Geological Survey covering those metals. The data here given relative to these two metals have been received through the courtesy and cooperation of Mr. J. M. Hill, Statistician in Charge of the San Francisco branch office of the Division of Mineral Resources. Anyone wishing fuller details of the production of these metals may obtain the same by applying to the U. S. Geological Survey, Washington, D. C., or to room 305, U. S. Custom House, San Francisco, California, for a copy of the 'separate' on the subject.

The gold production of California for 1923 was distributed, by counties, as follows :

¹U. S. Geol. Surv., Press Bulletin July 11, 1924.

Gold Production by Counties, 1923.

| County | Value | County | Value |
|-----------------------------------|-------------|---------------------|--------------|
| Amador..... | \$1,734,133 | Nevada..... | \$2,282,155 |
| Butte..... | 487,393 | Placer..... | 75,732 |
| Calaveras..... | 1,205,784 | Plumas..... | 174,871 |
| Del Norte..... | 1,778 | Sacramento..... | 1,331,227 |
| El Dorado..... | 30,264 | San Bernardino..... | 210,923 |
| Fresno..... | 18,519 | San Diego..... | 822 |
| Humboldt..... | 2,260 | Shasta..... | 359,487 |
| Imperial, Orange, Riverside*..... | 1,126 | Sierra..... | 878,164 |
| Inyo..... | 36,702 | Siskiyou..... | 45,633 |
| Kern..... | 107,051 | Stanislaus..... | 174,814 |
| Lassen, Merced, Modoc*..... | 661 | Trinity..... | 617,841 |
| Los Angeles..... | 714 | Tuolumne..... | 261,936 |
| Madera..... | 12,074 | Yuba..... | 3,150,405 |
| Mariposa..... | 141,883 | | |
| Mono..... | 34,661 | Total..... | \$13,379,013 |

*Combined to conceal output of a single producer in each.

The decline in gold yield from the 1922 figure of \$14,670,346 was due to a lower production from the quartz mines, whereas the placer yield showed a slight increase. The tonnage of dry gold ores treated in 1923 was about 200,000 tons less, but the yield of gold from all other classes of ore was greater in 1923 than in 1922.

Total Gold Production of California.

| Year | Value | Year | Value |
|-----------|------------|------------|-----------------|
| 1848..... | \$245,301 | 1886..... | \$14,716,506 |

GYPSUM.

During 1923, one operator each in Imperial, Kern, Riverside and San Bernardino counties produced a total of 86,410 tons of gypsum valued at \$289,136, compared with 47,084 tons, worth \$188,336 in 1922. The material was utilized mainly in cement manufacture, plaster and for fertilizer. The 1923 shipments of gypsum were the largest in the history of the industry in California, the increase being due to the opening up of a deposit in western Imperial County, by the Imperial Gypsum and Oil Company.

Total Production of Gypsum in California.

Production of gypsum annually in California since such records have been compiled by this Bureau is as follows:

| Year | Tons | Value | Year | Tons | Value |
|-----------|--------|----------|-------------|---------|-------------|
| 1887----- | 2,700 | \$27,000 | 1906----- | 21,000 | \$69,000 |
| 1888----- | 2,500 | 25,000 | 1907----- | 8,900 | 57,700 |
| 1889----- | 3,000 | 30,000 | 1908----- | 34,600 | 155,400 |

LIME.

Lime to the amount of 70,894 tons, valued at \$788,834, was produced by nine plants in six counties during 1922, as compared with 57,875 tons valued at \$671,747 in 1922. There were two plants each in Kern, San Bernardino and Santa Cruz counties, and one each in Shasta, Siskiyou and Tuolumne County. Previous to this present report the lime output has been recorded in 'barrels;' but as that unit is variable, and as most of the operators are now reporting in 'tons,' we have adopted the short ton instead and have converted the figures in the table of annual production to that unit, as shown below.

So far as we have been able to segregate the data, these figures include only such lime as is used in building operations. A portion is hydrated lime. Limestone utilized in sugar making, for smelter flux, as a fertilizer, and other special industrial uses, are classified under 'Industrial Materials.' That consumed in cement manufacture is included in the value of cement.

Reports from the San Francisco district indicate that the market there is being adversely affected by the importation of Canadian lime against which there is an inadequate duty.

Lime Production of California by Years.

The following tabulation gives the amounts and value of lime pro-

duced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau:

| Year | Tons | Value | Year | Tons | Value |
|-----------|--------|-----------|-------------|-----------|--------------|
| 1894..... | 37,350 | \$318,700 | 1909..... | 52,075 | \$577,824 |
| 1895..... | 39,776 | 386,094 | 1910..... | 47,951 | 477,683 |
| 1896..... | 30,275 | 261,505 | 1911..... | 42,959 | 390,988 |
| 1897..... | 28,780 | 252,900 | 1912..... | 52,212 | 464,440 |
| 1898..... | 29,786 | 254,010 | 1913..... | 61,344 | 528,547 |
| 1899..... | 29,985 | 314,575 | 1914..... | 43,996 | 378,663 |
| 1900..... | 31,252 | 283,699 | 1915..... | 35,653 | 286,304 |
| 1901..... | 31,738 | 334,688 | 1916..... | 49,364 | 390,475 |
| 1902..... | 44,866 | 369,616 | 1917..... | 50,073 | 311,380 |
| 1903..... | 49,659 | 418,280 | 1918..... | 43,684 | 461,315 |
| 1904..... | 57,945 | 571,749 | 1919..... | 42,070 | 552,043 |
| 1905..... | 61,700 | 555,322 | 1920..... | 46,314 | 557,232 |

| 1907..... | 68,422 | 756,376 | 1922..... | 57,875 | 671,747 |
| 1908..... | 39,639 | 379,243 | 1923..... | 70,894 | 788,834 |
| | | | Totals..... | 1,392,917 | \$13,667,911 |

LIMESTONE.

'Industrial' limestone was produced in nine counties during 1923, to the amount of 143,266 tons, valued at \$348,464, being an increase both in quantity and value over the 1922 output of 84,382 tons, worth \$282,181.

The amount here given does not include the limestone used in the manufacture of cement nor for macadam and concrete, nor of lime for building purposes; but accounts for that utilized as a smelter and foundry flux, for glass and sugar making, and other special chemical and manufacturing processes. It also includes that utilized for fertilizers (agricultural 'lime'), 'roofing gravel,' paint filler, whiting for paint, putty, kalsomine, terrazzo, paving dust, concrete filler, chicken grit, carbon dioxide gas, 'paving compound,' and facing dust for concrete pipe. That indicated in the table below as coming from Santa Clara County and a part of that from Los Angeles is calcareous marl sold for agricultural purposes. Of the total product in 1923 approximately 23,000 tons valued at \$101,000 was used for agricultural purposes.

Distribution of the 1923 output was as follows:

| County | Tons | Value |
|----------------------------------|---------|-----------|
| El Dorado..... | 95,274 | \$163,987 |
| Los Angeles..... | 2,717 | 8,779 |
| San Bernardino..... | 5,859 | 28,324 |
| Santa Clara..... | 8,252 | 49,512 |
| Santa Cruz..... | 6,733 | 14,242 |
| Tuolumne..... | 3,140 | 7,680 |
| Tulare..... | 15,500 | 57,500 |
| Contra Costa, Kern, Shasta*..... | 5,791 | 18,440 |
| Totals..... | 143,266 | \$348,464 |

*Combined to conceal output of a single operator in each.

Limestone Production of California by Years.

The following tabulation gives the amounts and value of 'industrial' limestone produced in California by years since 1894 when compilation of such records was begun by the State Mining Bureau. These tonnages consist principally of limestone utilized for flux, glass and sugar making, agricultural, chemical, and other special industrial purposes. That utilized in cement manufacture is not included.

| Year | Tons | Value | Year | Tons | Value |
|-----------|---------|----------|-------------|-----------|-------------|
| 1894..... | 15,420 | \$19,275 | 1910..... | 684,635 | \$581,208 |
| 1895..... | 71,355 | 71,690 | 1911..... | 516,398 | 452,790 |
| 1896..... | 68,184 | 71,112 | 1912..... | 613,375 | 570,248 |
| 1897..... | 36,796 | 38,556 | 1913..... | 301,918 | 274,455 |
| 1898..... | 27,686 | 24,548 | 1914..... | 572,272 | 517,713 |
| 1899..... | 30,769 | 29,185 | 1915..... | 146,324 | 156,288 |
| 1900..... | 32,791 | 31,532 | 1916..... | 187,521 | 217,733 |
| 1901..... | 76,937 | 99,445 | 1917..... | 237,279 | 356,396 |
| 1902..... | 71,422 | 90,524 | 1918..... | 208,566 | 456,258 |
| 1903..... | 125,919 | 163,988 | 1919..... | 88,291 | 248,145 |
| 1904..... | 40,207 | 87,207 | 1920..... | 90,120 | 298,197 |
| 1905..... | 192,749 | 323,325 | 1921..... | 75,921 | 305,912 |
| 1906..... | 80,262 | 162,827 | 1922..... | 84,382 | 282,181 |
| 1907..... | 230,985 | 406,041 | 1923..... | 143,266 | 348,464 |
| 1908..... | 273,890 | 297,264 | | | |
| 1909..... | 337,676 | 419,921 | Totals..... | 5,663,316 | \$7,402,428 |

MINERAL PAINT.

Mineral paint materials were produced in California in 1923 from a total of five properties in the following three counties: Nevada, Stanislaus and Ventura. The total amounted to 1049 tons, valued at \$11,773, being a decrease from the 1620 tons and \$13,277 of 1922. The material shipped from Nevada County is hematite; from Stanislaus, yellow ochre; and that from Ventura, red ochre.

Mineral Paint Production of California, by Years.

The first recorded production of mineral paint materials in the state was in the year 1890. The output, showing annual amount and value, since that time, is given herewith:

| Year | Tons | Value | Year | Tons | Value |
|-----------|-------|--------|-------------|--------|-----------|
| 1890..... | 40 | \$480 | 1908..... | 335 | \$2,250 |
| 1891..... | 22 | 880 | 1909..... | 305 | 2,325 |
| 1892..... | 25 | 750 | 1910..... | 200 | 2,040 |
| 1893..... | 590 | 26,795 | 1911..... | 186 | 1,184 |
| 1894..... | 610 | 14,140 | 1912..... | 300 | 1,800 |
| 1895..... | 750 | 8,425 | 1913..... | 303 | 1,780 |
| 1896..... | 395 | 5,540 | 1914..... | 132 | 847 |
| 1897..... | 578 | 8,165 | 1915..... | 311 | 1,756 |
| 1898..... | 653 | 9,698 | 1916..... | 643 | 3,960 |

PETROLEUM.

The crude oil production of California for 1923 amounted to a total of 262,875,690 barrels of clean oil, valued at \$242,731,309 at the well. This total of quantity is compiled from the monthly production reports filed by the operators with the State Oil and Gas Supervisor, to which have been added figures for the output of a number of small operators in the Los Angeles city field not under the jurisdiction of the Supervisor, and from one property in Santa Clara County.

The question of the value of the crude oil yield, at the well, is a difficult one to settle with exactitude, principally because a large part of the output is not sold until after refining. The large refiners are also large producers of crude oil which they send direct from well to plant, hence much of the crude is not sold as such. The values used in the statistical reports of the State Mining Bureau since 1914 have been derived from averages of actual sales of crude oil of all grades in each field of the state, and these averages applied to the total yield of the respective fields. This we feel is a safer measure of commercial values than market quotations, because quotations do not always mean sales.

Features of 1923.

The outstanding feature of the year 1923 in the oil industry of California was the continued increase in Los Angeles and Orange counties due to intensive drilling of new and gusher wells yielding high-gravity oil, with consequent overproduction. This necessitated the continued shutting-in of low-gravity wells in other fields of the state. As in 1922, this resulted in further decreased output of crude oil in Fresno, Kern and Santa Barbara counties. The peak of production came in the month of August, 1923, when the state's total amounted to 26,440,005 barrels, followed by a figure only slightly less for the month of September. The increase in Los Angeles County alone was more than four-fold, while the Orange County yield was 50 per cent greater than the previous year. As in 1922, Ventura County also increased, to the extent of approximately 25 per cent.

There were three reductions in 1923 in prices quoted for crude oil at the well, above 20° Baumé gravity, announced by the marketing companies, January 6, April 10, and October 9. The reductions were proportionately greater for the specific gravities above 28° than for those below. Both in 1922 and 1923, the price reductions to a limited extent, only, affected the production total by causing the shutting-in of wells yielding oil of the lower gravities and in the districts outside of the areas where intensive campaigns of new developments were taking place. The unprecedented increase in production taxed the storage, transportation, and refining facilities of all of the marketing concerns. Shipments by sea via the Panama Canal to Atlantic seaboard points advanced to important amounts and became of vital assistance in the situation.

Estimating in January the output of the year just closed, the State Oil and Gas Supervisor¹ presents the following observations:

¹California again broke all previous records in its production of petroleum by producing 262,875,690 barrels in 1923. This is about 36 per cent of the amount

¹Bush, R. D., Weekly press bulletin, No. 431: Dept. of Petr. and Gas; Cal. State Min. Bur. Jan. 26, 1924.

produced in the entire United States, and almost double the amount produced by California in 1922, which was a record year. This great increase was due to the intensive and rapid development of the Huntington Beach, Santa Fe Springs and Long Beach fields, where initial productions of nearly all the wells were large. These three fields produced 69.4 per cent of the state's production in 1923. This tremendous production taxed the storage capacity and marketing facilities of the large companies, and caused new markets for California crude oil to be opened. About 92,000,000 barrels of crude was in storage at the end of 1923, as compared with 61,380,000 barrels at the beginning of the year, and notwithstanding about 54,455,000 barrels was shipped through the Panama Canal to eastern refineries.

"During September, 1923, production reached its maximum, and then declined, this decline continuing to the end of the year, in spite of the fact that production was resumed in some of the San Joaquin Valley fields where it had been shut in. In December, 1923, for the first time since December, 1920, storage decreased, or, in other words, consumption which includes oil shipped to eastern ports through the Panama Canal, was greater than the December production, which averaged daily 706,000 barrels. The indicated consumption of oil increased during the year from 451,613 barrels in December, 1922, to 711,459 barrels in December, 1923.

"There were three reductions in the price of oil in 1923; the first reduction was made on January 6, when all grades, including 20 degrees Baumé and above, were reduced, the highest gravity (35 degrees and above) being reduced 53 cents. The next reduction, on April 10, for the refinable oils, amounted to 41 cents for the highest grade. The third reduction, amounting to 18 cents on the highest grade, was made on October 9. Fuel oil, or the grades below 20 degrees Baumé, remained stationary during the year.

"A total of 1400 new wells was started in 1923, as compared with 1439 in 1922. During the year, 980 producing wells were completed.

"At the close of the year with the Santa Fe Springs, Huntington Beach and Long Beach fields almost completely developed, activity in the Los Angeles Basin centered in Torrance field, but this field does not give promise of being as prolific, or of developing as rapidly, as the above mentioned fields, since most of the acreage is held in comparatively large leases by the larger companies. Activity is also gradually increasing in the older fields of the San Joaquin Valley, and the outlook for the petroleum industry for the year 1924 looks bright at the present time. The year started out with an increase in the price of all grades of oil amounting to 25 cents, effective January 22, and the prospect of additional increases during the year is good."

Outlook for 1924.

The outlook for the current year is for a somewhat lower total quantity than in 1923. At the same time, consumption is showing an unexpected decline, due to a number of causes, as noted by Bush¹ elsewhere herein.

Production Figures.

The following table gives the production and value by counties for 1923, compared with the 1922 figures:

TABLE A.
Production and Value of Oil, by Counties.

| County | 1922 | | 1923 | |
|---------------------------------|-------------|---------------|-------------|---------------|
| | Barrels | Value | Barrels | Value |
| Fresno..... | 9,265,526 | \$9,895,582 | 5,061,542 | \$3,593,695 |
| Kern..... | 53,512,157 | 64,803,222 | 45,952,794 | 37,629,300 |
| Los Angeles..... | 37,726,367 | 52,930,093 | 158,665,019 | 154,063,733 |
| Orange..... | 31,049,491 | 36,483,162 | 46,474,921 | 40,897,930 |
| San Luis Obispo..... | 33,856 | 31,892 | 32,988 | 19,793 |
| Santa Barbara..... | 3,931,155 | 3,974,398 | 3,061,947 | 2,394,433 |
| Ventura..... | 2,933,685 | 5,236,628 | 3,610,794 | 4,109,084 |
| San Mateo and Santa Clara*..... | 15,985 | 26,288 | 15,685 | 23,341 |
| Totals..... | 138,468,222 | \$173,381,265 | 262,875,690 | \$242,731,309 |

*Combined to conceal output of a single operator in San Mateo County.

¹ Bush, R. D., Features of production, first half of 1924, p. 201, *ante*.

The foregoing totals show a state average price of \$0.923 per barrel for the year 1923, as compared to \$1.249 in 1922. As already noted in a preceding paragraph, the drop in value was due to an overproduction in the higher grades of crude oil and a consequently greater proportional drop in prices for the higher grades.

TABLE B.
Total Petroleum Production in California.

| Year | Barrels | Value | Year | Barrels | Value |
|------------------|-------------|---------------|--------|---------------|-----------------|
| To and inc. 1875 | (a) 175,000 | (b) \$472,500 | 1900 | 4,329,950 | \$4,152,928 |
| 1876 | 12,000 | 30,000 | 1901 | 7,710,315 | 2,961,102 |
| 1877 | 13,000 | 29,250 | 1902 | 14,356,910 | 4,692,189 |
